Mr. Mechi said that on level land there could be no doubt that steam-ploughing, as conducted by Lord W. D'Eresby, was perfectly successful; and as to cost, so far as he could discover it would be about the same as that which had been stated by Mr. Williams. But there was one material objection wherever a field happened to have an elevation, and that objection arose not from the ploughs, but from the form of the engines. They had all horizontal tubes, and the moment they were off level ground a part of the tubes would of course be without water, and liable to be burnt out. The result was that in the field in which he saw them operating the parts on the slope could not be ploughed. If vertical boilers could be used, that difficulty might be overcome; but, unfortunately, success in this respect had not yet been attained. As to his (Mr. Mechi's) acquaintance with steam-power, he believed that Mr. Romaine's engine would have succeeded, and he had spent some money in making one. The revolving wheels performed 240 revolutions in a minute, and the earth and stones were made to fly in all directions; but in the process an amount of power was consumed which was altogether disproportionate to the quantity of land moved. There was not time for the prongs to get into the ground; and he really thought that with 15 revolutions a minute he should have done better than with 240. How far the engine would have the power of propelling itself he was unable to prove, because he adopted an improved system of boiler; and in order to get over the hills the tubes were made vertical instead of horizontal; but with the high-pressure the first attempt sent the water and steam in a shower out of the boiler over the horses. The boiler that would do a great deal of work in a horizontal form would, when the tubes were placed vertically, throw out the water with the steam and soon become emptied. His experiment failed, therefore, because there was too much velocity and too little steam, and he did not continue it, inasmuch as it would have required a large expenditure of time and an enormous outlay of capital, and it was certainly not his wish to spend another 500*l.* upon it. He had seen the model of Mr. Usher's steam-cultivator, and he had a strong opinion that, on account of its slow motion, it would effect the perfect cultivation of the soil. One very useful invention he observed on Lord Willoughby D'Eresby's farm. Finding that his chains almost always broke from the concussion of iron with iron, his lordship provided a remedy by the introduction of a thick collar of vulcanised Indian rubber, which acted as a spring, received the blows, and enabled the operation to be performed satisfactorily. With regard to fixed engines, he knew not what might ultimately be done by them. At the extensive manufactory of Mr. Salt, in the neighbourhood of Leeds, the extent of shafting would reach two miles; which proved that the time might come when the small amount of friction which arose from fixed shafting might carry the farmers' ideas much further than they had yet gone upon the subject of working by means of steam-power. The friction arising from shafting was very small when properly attended to, and 640 square acres were only a square mile, if the farmery were placed in the middle of that farm, then the extremities of the farm would be only half a mile distant; thus it became a question of importance to what extent shafting or pulleys with fixed engines might be used for the purposes of cultivation.

Mr. R. Baker had never thought it desirable that the steam-engine should operate over a very large space of land at one time; but rather that it should be kept to a certain limit, within which it would work with advantage; consequently, a large enclosure would require to be worked in portions, rather than in the whole of its extent at once. In that case the engine ought to move in a transverse direction across the field on a tramway; the rails to be so arranged that they might be taken up and laid down again as the engine was moved forward. Where great resistance was offered, a slow action was obviously preferable; and, in his opinion, it would be more advantageous in point of utility and advantage, that the engine when fixed should move a large number of cutting implements or ploughs slowly, than that it should work quickly, and move a plough at an accelerated rate.

Mr. Williams's plan, as he saw it at the Smithfield Show, with three ploughs in continuous succession, seemed to be a step in the right direction. An engine that would move three ploughs at once would move six, nine, or twelve, provided only the power employed was sufficient. Thus, when once the engine was there it would accomplish a great deal of work without the necessity of removal; but the motive power must be contrary to that which was produced in a locomotive engine. The latter was made for the purpose of propelling itself in a straight direction. The operations of an engine used for cultivating the land must be in an opposite direction from that which the engine would be propelled, so that to move it on the tramway must be effected by horse power, or a power independent of the engine itself. When he saw the various processes that were accomplished by steam in large manufactories, he could not imagine that the mere turning over the land 6 or 8 inches in depth presented insuperable mechanical difficulties.

Mr. J. Howard (Bedford) came for information, and to learn the "doom of the plough"—at least, so far as the implements now in use are concerned; but he confessed that he was as much as ever in the dark as to how the cultivation of the land can be effected by steam-power, that is, as to how it can be done economically and efficiently; for there is no engineering impossibility in the way. Any sanguine gentleman may have 100 acres, or any quantity, ploughed by steam if he will only pay for it. Engineers could be found also, if an order were given and payment guaranteed, who would soon accomplish the work. There could be no question as to the desirability of employing steam-power to the tillage of the land, and any practical method of applying this powerful agent would be the greatest boon to agriculture; but as to the mode of doing so, at present, we appeared to be totally in the dark. Mr. Mechi has alluded to the success of Lord Willoughby D'Eresby's experiments in steam-ploughing, and, lest the public should be misled by the statements made to-night, he (Mr. Howard) would just say, that he had seen the plough operation at Lord Willoughby's, and the clod

would judge of the "success" when they heard, that to plough 4 acres per day required two portable steam-engines with double cylinders of 26 or 28-horse power each, six men, and a horse and cart to fetch water and fuel. With all these to pay for, it was difficult to conceive how the cost of ploughing could be so little as that quoted this evening; he himself had made a calculation at the time, that the expense was more than a pound per acre. This calculation was based upon 4 acres per day, which, he was told, was about the quantity that could be done if no breakages occurred; and accidents, he learned, were the rule, and not the exception.

Mr. Mechi: There must be some mistake about what you say as to Lord Willoughby D'Eresby's farm, for Mr. Williams has read a report from Mr. Scott, his intelligent manager, which states the exact cost per acre.—Mr. Williams: Yes, that it was less than 8s. an acre.—Mr. Mechi had asked the man who was driving one of the engines, and he stated that it was 8s. an acre; but certainly the engines could not have been of 28-horse power.—Mr. Howard knew that they were double cylinder engines of 28-horse power each, manufactured by Couch.—Mr. Williams: They were described to me as 28-horse power.—Mr. Howard would leave the meeting to judge, then, whether two 28-horse power engines could be driven for 8s. a day.—Mr. Mechi: That depends very much upon how they are driven.—Mr. Howard had made a calculation, and, sinking the interest on the money, had come to the conclusion that the cost was, at least, 1l. per acre.

Mr. Swaine said that in discussing the applicability of steam-power to agricultural purposes, they should carefully bear in mind the expense at which it was to be worked. In the case of light land, he could not conceive that ploughing by steam could be done at much less cost than ploughing with horse-power. He would suppose that he had to plough an acre of light land with horse-power. The keep of two horses, at 1s. 9d. a day, would of course be 3s. 6d.; and one man, whose wages were 1s. or 1s. 2d. a day, would plough the acre within the day. This gave an expense of from 4s. 6d. to 5s. an acre. Mr. Williams, indeed, reckoned that there was a loss of 5l. a year on a horse. He, on the other hand, contended that under good management no such loss would be incurred; and keeping in view the question of profit, he was inclined to rest contented with horse-power.

Mr. Thomas thought with respect to the relative advantages of fixed or portable engines for barn work, he had supposed that two years ago the club were almost unanimously of opinion that for all such work fixed engines were by far the most economical. The reports from East Lothian, which was always looked upon as a model farming district, all supported that view; and Lord Kinnaird, in a valuable paper which he had sent to the Royal Agricultural Society, had, he thought, expressed a similar opinion. He (Mr. Thomas) hoped they would never get into the habit of using portable pig-styes and similar contrivances; and, indeed, if such a practice were to prevail, what would be the use of asking landlords to build good homesteads? If the plan proposed by Mr Williams were the most profitable one, there would be no need of farm-buildings. With regard to the application of steam power to ploughing, he was inclined to leave that matter at present to Mr. Williams, who appeared sanguine as to the result; and the more so because in a paper which he introduced some time ago, having reference to the employment of farm-labourers, he observed that the best mode of promoting their employment was, not to wriggle along on the old jog-trot system, but to aim at introducing improvements, in order that there might be as large a growth of corn as possible, and that it might be disposed of to the public at a cheap rate. Therefore, he heartily wished Mr. Williams success. He believed that, in the calculations which he made with regard to the expense of horses, he was rather under than over the mark. There was no part of his expenditure which he paid so unwillingly as that which was connected with the keep of his horses. Every shilling expended upon horses for work that could be done as cheaply by steam was lost to the country. It might, he thought, be laid down as an axiom that whatever could be done as well and as cheaply by horses as by men should be done by horses; but that if it could be done equally well and cheaper by steam, it should in that case be done by steam.

On the motion of Mr. J. Payne, seconded by Mr. Mechi, it was resolved:—

"That this meeting expresses its conviction of the benefits that would accrue to agriculture by the introduction of any invention by which the land of this country could be economically and scientific cultivated by steam-power; but at present the club not sufficiently informed upon the subject to recommend any particular method."

Notices of Books.

The Yester Deep Land Culture. By Henry Stephens, F.R.S.E. Blackwood and Son.

This is a detailed report of the farms cultivated by the Marquis of Tweeddale—of the implements which his lordship has invented and employed—and the processes by which poor land in an unkindly climate has been made productive.

The work deserves a detailed examination, which we shall give it. At present we may merely mention that it is well worth perusal by those anxious to know the particulars of an extensive experience in the deep and thorough cultivation of the soil.

Notices to Correspondents.

John Cathartikum: *Cambrian.* It grows on poor sandy pastures and may yield to pasturing and the use of clayey composts.

Farm-servant: *S S.* If you bought superphosphate, and it is not superphosphate, you cannot be made to pay. If you bought X. a "manure for Turnips," you will have to pay him for it whatever it may be.

Tom Hall: *P.* We have no doubt it will be useful—we never made it, or knew it made. Cut it when in full flower, or nearly in seed.

Erratum. In the Report to the Agricultural Society, p. 321, col. c, line 58 from bottom, for "state" read "stalls;" col c, line 22 from bottom, "26 rolls of butter" should be "16 rolls."

WARNER'S IMPROVED LIQUID MANURE OR GENERAL PORTABLE PUMP.

The valve is a ball of imperishable material, and cannot clog in action. The barrel is of galvanised iron, not likely to corrode, and can be raised or lowered at pleasure. The legs will fold together, and the whole may be carried on shoulder to any pond or tank required.

Price of 4½ in. Pump, with legs, 3l. 3s. The barrel is 27½ in. long, and the legs are 5 ft. high.

1½ inch Gutta Percha Suction Pipe 1s. 6d. per foot.

1½ inch Flexible Rubber and Canvas Suction Pipe, 3s. 6d. per foot.

May be obtained of any Ironmonger or Plumber in town or country, at the above prices, or of the Patentees and Manufacturers, John Warner & Sons, 8, Crescent, Jewin Street, London.

Every description of Machinery for Raising Water, by means of Wheels, Rams, Deep Well Pumps, &c.; also Fire and Garden Engines, &c.—Engravings sent on application.

WARNER'S PATENT VIBRATING STANDARD PUMPS.

PATENT CAST-IRON PUMPS, for the use of Farms, Cottages, Manure Tanks, and Wells of a depth not exceeding 30 feet.

Diameter of Barrel	Length of Barrel, under nose.		£	s.	d.
2½ in.	short 1 ft. 7 in.	Fitted for lead,	1	12	0
2½ „	long 3 „ 3 „	gutta percha,	1	15	0
3 „	ditto 3 „ 6 „	or cast iron	2	12	0
3½ „	ditto 3 „ 6 „	flanged pipe,	2	18	0
4 „	ditto 3 „ 6 „	as required.	3	5	0
2½ „	short, with 15 feet of Lead Pipe attached, and Bolts and Nuts ready for fixing		2	12	0
2½ in.	long ditto ditto	ditto	2	15	0

The short barrel Pump is very convenient for fixing in situations of limited height and space, for the supply of coppers and sinks in Wash-houses with soft water from underground tanks, or in Hot, Forcing, and Plant Houses; they may be fixed, when desired, under the stage.

May be obtained of any Ironmonger or Plumber in Town or Country, at the above prices, or of the Patentees and Manufacturers, JOHN WARNER AND SONS, 8, Crescent, Jewin Street, London.

Every description of Machinery for Raising Water, by means of Wheels, Rams, Deep Well Pumps, &c.; also Fire and Garden Engines, &c. &c.—Engravings sent on application.

JOHN WARNER AND SONS, Crescent, Jewin Street, London.

GALVANISED IRON TUB GARDEN ENGINE, With Warner's Registered Spreader,

is strongly recommended, for durability and low price, viz., 2l. 19s., to hold 10 gallons.

Larger sizes in wood or iron, viz., 14 gals., 24 gals., & 35 gals. May be obtained of any Ironmonger or Plumber in town or country, or of the Patentees and Manufacturers, as also Machinery of all kinds for raising Water from any depth to any height by Steam, Horse, or Manual Power. Prices sent on application. Syringes of various constructions and sizes from 9s. upwards. Metallic String from 5d. to 1s. 3d. per lb.

JOHN WARNER AND SONS, 8, Jewin Crescent, London, Manufacturers of FIRE ENGINES, PUMPS, GARDEN ENGINES, and SYRINGES.

Brass Syringes, 9s. to 18s.

All articles of John Warner & Sons' manufacture may be obtained of any Ironmonger or Plumber in town or country, at the advertised prices.

John Warner & Sons having been practical Horticulturists for many years, know exactly the requirements of both Amateurs and Gardeners. A gardener with a properly constructed pump will get through as much work in five minutes as he could with any Syringe in a quarter of an hour, and with half the labour to himself. Syringes are economical for small houses.

No establishment offers such a variety of effective machines for hydraulic purposes, whether to supply Gardens, Hothouses, Cottages, Farms, Mansions, or Boards of Health, with every requisite connected with the conveyance and distribution of liquids.

Fountains suitable for Conservatories, Lawns, &c.

Sheets of Engravings sent on application.

STEPHENSON AND PEILL, 61, Gracechurch Street, London, and 17, New Park Street, Southwark, Manufacturers of Copper Cylindrical and Improved Conical Iron BOILERS, and Conservatory and Hothouse Builders, either in Wood or Iron, respectfully call the attention of the Nobility, Gentry, and Nurserymen to their simple but efficacious method of warming Horticultural and other Buildings by Hot Water.

From the extensive works they have executed, references of the highest respectability can be given, and full particulars furnished on application.

CAUTION.

PARKES' STEEL DIGGING FORKS AND DRAINING TOOLS.

Whereas very inferior descriptions of Steel Digging Forks are now manufactured and sold, and I have been informed that purchasers of the same have believed them to be the same as those manufactured by me, and to which the Royal Agricultural Society and numerous Agricultural Societies' prizes have been awarded, I hereby respectfully inform the public that every Fork manufactured by me is stamped with my trade mark "J. P.," and that Messrs. Burgess & Key, of No. 103, Newgate Street, London, are my sole Wholesale Agents, and I have authorised them to replace to the purchaser every Fork of my manufacture found defective; they will also on application send Wholesale and Retail Price Lists, &c., post free. Francis Parkes & Co.

SCYTHES.

BOYD'S PATENT SELF-ADJUSTING SCYTHES may be had of the Manufacturers, William Dray & Co., Swan Lane, London; and of all Ironmongers and Seedsmen. A liberal allowance to the trade.

CLAYTON, SHUTTLEWORTH, AND CO.'S PRIZE PORTABLE STEAM ENGINES, AND COMBINED THRESHING, STRAW SHAKING, RIDDLING AND WINNOWING MACHINE may be seen at their London Establishment, 6, Fitzroy Terrace, New Road, where all information relative thereto can be obtained. These Machines are constructed to horn Barley, and make a perfect separation of the chaff from the pulse. They are fitted with Elevators, which deposit the grain into bags, and beyond the feeder of Machine require no hands except to take away the Corn, &c., as threshed, the whole of the operations being performed by self-acting machinery, whereby the Corn, Straw, Chaff, and Pulse are delivered in the places assigned for them.

C. S. & Co. have paid special attention to this class of Machinery, and Fixed Barn Machinery, and from the position they have taken at the Royal and all the leading Agricultural Shows of England, flatter themselves that for efficiency, durability, and simplicity, their Engines and Machines are not surpassed by any other maker in England. All letters forwarded to the Works at Lincoln will have immediate attention; and Illustrated Catalogues forwarded to all parts of the kingdom postage free.

SAMUELSON'S REGISTERED LAWN MOWING MACHINES. To cut 16, 19, 22, and 25 inches wide. The Registered Improvement renders unnecessary the great care requisite in the handling of these Machines on the old plan. All that is now required can be done *by any unskilled labourer*, who has only to push the Machine before him, the Registered Adjustment insuring a clean cut of uniform height, and preventing the knives from cutting into the soil, however uneven the ground may be. Illustrated Price Lists, with copies of Testimonials, and a Catalogue of his other Agricultural Implements, may be procured, post-paid, on application to the Manufacturer,

B. Samuelson, Britannia Works, Banbury, Oxon.

The above may also be procured at the principal Agricultural Implement Depôts in London, and of all respectable Ironmongers and Seedsmen in the country.

IMPROVED LAWN MOWING MACHINES, Budding's Patent.

MANUFACTURED AND SOLD BY

J. AND H. FERRABEE, Phœnix Iron Works, near Stroud, Gloucestershire.

These are the only MOWING MACHINES that can be used by unskilled labourers with equal facility on Lawns, Verges, between Flower beds, on Bowling Greens, Cricket and Pleasure Grounds; 4500 of them have been sold.

Hand Machine, for One Man, cutting	16 inches wide	£5	10s.	0d.
Ditto for Two Men	„ 22 ditto	... 6	0	0
Pony Machine (or Donkey)	„ 26 ditto	... 8	0	0
Horse Machine	„ 28 ditto	... 11	0	0
Ditto	„ 36 ditto	... 15	0	0

London Agency:—The Manager of the Agricultural Department, Baker Street Bazaar.

IMPROVED MOWING AND ROLLING MACHINE.

ALEXANDER SHANKS AND SON, Arbroath, Forfarshire, Inventors and Sole Manufacturers, respectfully solicit the attention of the Nobility, Gentry, and Gardeners to this Improved Machine for Mowing and Rolling Lawns. The Machine is in operation in the Royal Gardens at Windsor Palace, Buckingham Palace, and at Osborne, in the Botanical Gardens at Kew, Regent's Park, Manchester, Sheffield, &c.; at Blenheim Palace, Trentham, Cleveden, Elvaston, Broadlands, Woburn Abbey, Clumber, Lilleshall, Castle Howard, Shrubland, Eridge Castle, Enville Hall, Tiptree Hall, Chatsworth, and in many other of the principal gardens in the kingdom as well as in the United States, British America, and on the Continent, where its merits have been fully proved, and its success established.

The machine is made to cut the breadth of 42, 30, 20, and 15 inches respectively, is exceedingly durable, easily managed, and adjusted to cut to the length required. The execution of the work is far superior to what may be attained by the most skilful mower, while at the same time a great saving of labour is effected, and the turf much improved. By the largest machine a Scotch acre may be mowed, rolled, and the Grass collected in one hour.

A. S. and Son have much pleasure in stating that they have made considerable improvements in their 15-inch or hand machine this year, by which the draught is considerably lessened. This machine combines all the merits and advantages of the larger machines with firm and secure construction, and is admirably adapted for borders and for lawns of no great extent.

Alexander Shanks and Son also respectfully solicit notice to "Fleming's Weeding or Salting Machine" for destroying weeds in gravel walks, court-yards, drives, &c. This machine is now in operation in many parts of England, where it has given ample satisfaction as the best and most economical means of thoroughly keeping down weeds or Moss.

Further particulars, with testimonials and prices, may be had on application.

TRELOAR'S COCOA-NUT FIBRE MANUFACTURES, consisting of MATTING, MATS, MATTRESSES, BRUSHES, NETTING, HORSE-HAIR, and BRISTLE SUBSTITUTE, are distinguished for superiority and excellency of workmanship, combined with moderate prices. Prize Medal both in England and America at the Exhibition of all Nations.

T. Treloar, Cocoa-nut Fibre Manufacturer, 42, Ludgate Hill, London.

RICHMOND & CHANDLER'S PATENT CHAFF CUTTING MACHINE.

All the various modern Implements of Agriculture manufactured on the most scientific and improved principles, suitable for home use and exportation.—Address, Richmond & Chandler, Salford, Manchester; and 32, South John Street, Liverpool.

☞ Catalogues Gratis.

PARKES' STEEL DIGGING FORKS & DRAINING TOOLS.

MESSRS. BURGESS and KEY, as Mr. Parkes' Wholesale Agents for England, have always in stock a large assortment. These Forks and Tools are now in use by upwards of 1000 of the Nobility and Farmers, members of the Royal Agricultural Society, who pronounce them to be the best ever invented, and to facilitate labour at least 20 per cent. Price Lists sent free on application, and Illustrated Catalogue of the best Farm Implements, on receipt of eight postage stamps.

IMPORTANT TO GROWERS OF ROSES.

NEWLY-INVENTED APHIS BRUSH, or GREEN FLY DESTROYER.—The attention of Florists is particularly called to this Cheap and Ingenious Instrument, invented by the Rev. E. S. Bull, of Colchester, which, in a very simple and easy manner, instantly cleanses the Rose from that destructive insect the Green-fly (or Aphis), without causing the slightest injury to the bud or foliage.

Price 2s. 6d. each, or free by post, 3s. 6d.

Manufactured by
JOSLIN AND SONS,
Ironmongers, Colchester.

Retailed by all the principal Ironmongers.
Wholesale Agents:
W. Thompson & Son, 15, Upper North Place, Gray's Inn Road, London.

BEEHIVES.

MILTON'S IMPROVED COTTAGE HIVE, price 1l. 2s. The only Beehives for which the Exhibition Prize Medal of 1851 was awarded, with all the latest improvements to obtain pure honey without killing the bees; also every kind of Patent and Wooden Hives, Glasses, Feeders, &c.

"The Practical Bee Keeper," the most useful book of the day, a complete Guide to Bee-management, by John Milton; price 2s. Likewise his Illustrated Catalogue, price 3d.; per post, 4d.

Beehive Warehouse, 10, Great Marylebone Street, London.

BEE HIVES.

NEIGHBOUR'S IMPROVED COTTAGE BEE-HIVE, as originally introduced by George Neighbour & Sons, with all the recent improvements, glasses, thermometer, &c., price 35s., securely packed for the country.

This unique hive has met with universal commendation, and may be worked with safety, humanity, and profit, by the most timid; its arrangements are so perfect, that the honey may be taken at any time of the gathering season without at all injuring the bees.

Early applications, addressed to Geo. Neighbour & Sons, 127, High Holborn, or 149, Regent Street, London, will receive prompt attention. Their newly arranged Catalogue of other improved Beehives, with Drawings and Prices, sent on receipt of two stamps.

Agents:—Manchester, Hall & Wilson, 50, King Street; Liverpool, James Cuthbert, 12, Clayton Square; Chester, F. & A. Dickson & Sons, 106, Eastgate Street; Glasgow, Austen & M'Aslan, 186, Trongate Street; Dublin, J. Edmundson & Co., 61, Dame Street.

COTTAM and HALLEN have on Show, at their Repository, No. 2, Winsley Street, Oxford Street, London, a great variety of the following articles for the Garden, &c., at very low prices, viz.:—Garden Rollers, Cast-Iron Rickstands, Garden Engines, Mowing Machines, Garden Chairs, Superior Garden Tools of all kinds, Garden Vases and Pedestals in great variety, and a large assortment of Horticultural and Agricultural Implements.

Ornamental Wire Flower Stands, Pot Trainers, Rose Tree Guards, Flower Bordering, and every description of Wire Work, both plain and ornamental.

Hand Glass Frames, Cast and Wrought Iron Flower Stakes, Garden Arches, &c.

Strong Iron Hurdles, and best Wire for Strained Wire Fencing.

Hothouses, Conservatories, &c., made upon the most improved principle, either of Iron, or of Iron and Wood combined, which can be fixed complete, with Hot Water Apparatus, in any part of the Kingdom.

Show Rooms at the Manufactory, 2, Winsley Street, Oxford Street, opposite the Pantheon, where every information may be obtained.

THE CRYSTAL PALACE FLOWER BASKETS made to the original, and a variety of new and elegant Designs for Conservatory, Verandah, Drawing-room, &c., from 3s. 6d. upwards, by W. RICHARDS, Wire-worker, &c., 370, Oxford Street, nearly opposite the Princess's Theatre. Conservatories fitted up, Aviaries, Bird-cages, Flower Stands, and every description of Wire work. Game and Garden Fencing of the best description.

N.B. Holland, Venetian, Wire, and all kinds of Sun shades, and Window Blinds of best quality.

GARDEN NETS, FISHING NETS, and SHEEP NETS, made by machinery; of excellent quality, and at very low prices.—R. Richardson, 21, Tonbridge Place, New Road, London.—N.B. Old Fishing Nets Tanned and Repaired, 6s. 3d. per 100 yards.

HOSE PIPING.

TO ENGINEERS, AGRICULTURISTS, GARDENERS, SHIP CHANDLERS, AND FIRE BRIGADES.

WAITHMAN'S PATENT FLAX TUBING (1 in. to 3 inches in diameter) will sustain a greater pressure, is lighter, less bulky, will wear longer, and is about 60 per cent. cheaper than the leather hose pipe. Manufactured only by Waithman & Co., Bentham, Lancaster.

Inches in Diameter and Price Per Yard.—¾, 9d.; 1, 1s. 1d.; 1¼, 1s. 3d.; 1½, 1s. 7d.; 1¾, 1s. 9d.; 2, 2s.; 2½, 2s. 4d.; 2¾, 2s. 6d.; 3, 2s. 9d.

Testimonial from Mr. Wright, Lancaster.—I beg to inform you that I yesterday tested your piece of 2½ inch Patent Flax Tubing connected with the Lancaster Waterworks, in the presence of the Mayor, Mr. Rawlinson, Government Inspector, Professor Owen, &c. The column of water at which the tubing was tested was equal to 340 feet in height, or about 150 lbs. on the square inch, and I have pleasure in stating that the hose sustained the pressure most admirably.

Testimonial of Captain Martin, of the Great Britain Steam Ship.—I have much pleasure in being able to tell you that your hose supplied to the Great Britain and other ships, is well worth the attention of shipowners. It gives us great satisfaction.

Testimonial from Fairbairn & Co., of Leeds.—We have tested your hose, 2½ inch in diameter, with the pressure of the Leeds Waterworks, and found it highly satisfactory.

(Fig. 1.)

(Fig. 2.)

J. TYLOR and SON'S BARROW GARDEN ENGINE (Fig. 1), in best well painted oak tub, fitted with improved Pump, universal joint, and registered Spreader, which answers the purpose of the separate rose fan and jet.

No. 1 holds 10 gallons,	throws 30 feet high			...	£4 10
No. 2 „ 15 „	„ 45	„		...	5 10
No. 3 „ 28 „	„ 45	„		...	8 18

J. TYLOR & SON'S BARROW GARDEN ENGINE (Fig. 2), in strong tinned iron tub, well painted inside and outside, with improved Pump, universal joint, and registered Spreader, which answers the purpose of the separate rose fan and jet.

No. 10 holds 8 gallons,	throws 25 feet high			...	£2 15
No. 13 „ 12 „	„ 30	„		...	3 5
No. 11 „ 16 „	„ 40	„		...	4 0
No. 12 „ 24 „	„ 45	„		...	5 0
No. 14 „ 30 „	„ 45	„		...	5 18

A large assortment of every description of Garden Syringes, Pail Engines, Conservatory Pumps, &c., kept in Stock.

No. 1, Plain Syringe, with rose and jet, diameter of barrel, 1¼ inch, 14s. 3d.; No. 2, do., diameter of barrel, 1⅜ inch, 12s.; No. 3, do., diameter of barrel, 1⅜ inch, 10s. 6d.

Read's Syringe, with two roses and one jet, 19s.

J. Tylor & Son's Horticultural Apparatus may be obtained at these prices from any respectable Ironmonger or Seedsman in town or country, through whom alone they will be supplied, and of whom Drawings and Prices may be had.

N.B. Cost of carriage, &c., not included in these prices.

J. Tylor & Son's Manufactory, Warwick Lane, Newgate Street, London.

J. TYLOR and SON'S REGISTERED GARDEN SYRINGE.—Small size, for Amateur use, 21s. each. Large size, for Gardeners' use, 25s. each.

Extra for Telescope Tube as shown in engraving for watering plants on stands at a height of 8 feet, so that any quantity of water can be deposited in the pot without wetting the leaves.

By a simple arrangement this Syringe is rendered more effective than any portable Conservatory or Garden Pump now offered to the public. It is equally adapted for Garden or Conservatory use, and is capable of discharging twice as much water in a given time as any other Syringe now in use. The arrangement consists in attaching a small flexible suction tube to the barrel of the Syringe, through which it is filled with water at every discharge of the previous contents. By this means the Syringe is always charged, and the pull-up stroke of the piston rendered perfectly easy, it having, indeed, no work to do, the barrel being previously full of water. Being thus made self-supplying, a great saving of labour is effected; and the necessity of stooping to fill the syringe at every discharge being done away with, the direction of the water can be maintained for any length of time. It is perfectly cleanly in its action, as it is not possible for any water to get on the outside of the barrel, which is a well-known inconvenience attendant on the use of every other Syringe. Its construction is perfectly simple, and cannot get out of order; the ground in ball valves and fittings used for all other patent Syringes being entirely superseded. To be had of any respectable Ironmonger or Seedsman in town or country.

J. Tylor & Sons, Manufacturers of Horticultural Apparatus, Warwick Lane, Newgate Street, London.

N.B. These prices do not include carriage, package, or expense of delivery in the country.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

TO AGRICULTURISTS.

B. GREENING AND CO.

BEG to call attention to the Wire Fencing they are now offering at ONE SHILLING PER LINEAL YARD. It is 3 feet 9 inches high, very strong, exceedingly durable, and perfectly efficient, being warranted to turn Horses, Cattle, and Sheep. It is stronger than the common strained Wire Fencing, over which it possesses many considerable advantages. It may be firmly and effectively erected by farm labourers, it requires fewer supports than any other fence, and when fixed, although it is decidedly one of the firmest and most stable fences, yet it does not constitute that impediment to improvement that the strained fence or a hedge does, as it can be removed to another line without the expense of sending for skilled workmen.

Manufactured by Patent Machinery by B. GREENING and Co., Agricultural Iron Works, 1 & 3, Church Gate, Manchester.

N.B. Catalogues, Pattern Sheets, and Price Lists, sent per Post, on receipt of four Stamps (cost of postage).

GARDEN TENTS, without lines, iron frame work, and covered with wire. The Canvas can be removed in winter, and having double roofs and deep eaves, the wet shoots off, and the sides of the Tent are kept dry. They are well adapted for standing flowers in, being ornamental. Price 5*l.* each. Umbrella and all other kinds of Tents and Marquees for sale or hire.—R. RICHARDSON, 21, Tonbridge Place, New Road, London.

LINGHAM BROTHERS, No. 170, Hampton Street, Birmingham, sole Manufacturers of the improved WOOD and ZINC MONOGRAPH, or LABELS for Garden Borders, Flower-pots, &c., in boxes of 100 each. The Zinc Labels are highly approved of for their lasting durability, can be written upon with the greatest ease, and when dry a permanent inscription is secured. Directions are sent with each box, including a bottle of metallic ink.—Sole Agents in London, Messrs. DEANE, DRAY & Co., Horticultural Implement Warehouse, 46, King William Street, London Bridge.

TANNED NETTING, for the protection of Fruit Trees from frost, blight, and birds, and for the security of fresh sown seeds, either in Gardens or Fields, at 1*d.* per square yard: 200 yards, 14*s.*; 500 yards, 30*s.*; 1000 yards, 50*s.* Scrim Canvas, for Wall Fruit.—At EDGINGTON and Co.'s, Rick Cloth, Tent, and Waterproof Cloth Manufacturers, 17, Smithfield Bars, City, and Old Kent Road, Southwark; Emigrant Outfitters, Ship Chandlers, and Export Merchants, Brunswick Street, near the East India Export Dock, Blackwall.

WATERPROOF PATHS.
BARN AND CATTLE SHED FLOORS.

THOSE who would enjoy their Gardens during the winter months should construct their walks of PORTLAND CEMENT CONCRETE, which are formed thus:—Screen the gravel of which the path is at present made from the loam which is mixed with it, and to every part of clean gravel add one of sharp river sand. To five parts of such equal mixture add one of Portland Cement, and incorporate the whole well in the dry state before applying the water. It may then be laid on 2 inches thick. Any labourer can mix and spread it. No tool is required beyond the spade, and in 48 hours it becomes as hard as a rock. Vegetation cannot grow through or upon it, and it resists the action of the severest frost. It is necessary, as water does not soak through it, to give a fall from the middle of the path towards the sides.

The same preparation makes first-rate paving for BARNS, CATTLE-SHEDS, FARM-YARDS, and all other situations where a clean, hard bottom is a désideratum. May be laid in winter equally well as in summer.

Manufacturers of the Cement, J. B. WHITE & BROTHERS, Milbank Street, Westminster.

SUPERIOR FIRST CLASS CABINET AND UPHOLSTERY FURNITURE can only be obtained at moderate prices by purchasing direct from the manufacturer, thus saving the profit of the middle man, and securing thoroughly seasoned materials with soundness of workmanship, and an elegance of style not to be found at other houses. Families furnishing are respectfully solicited to inspect the extensive stock of Cabinet Furniture, Bedsteads, and Bedding, at JOHN VOLLUM'S old established manufactory, No. 3, Finsbury Pavement. Designs and estimates made for furnishing a house or single room in any part of the country free of charge. No charge made for packing country orders. Observe—No. 3, Finsbury Pavement, London, and the name most distinctly JOHN VOLLUM.

FENDERS, STOVES, AND FIRE-IRONS.—Buyers of the above are requested, before finally deciding, to visit WILLIAM S. BURTON'S SHOW ROOMS, 39, Oxford Street (corner of Newman Street), Nos. 1, 2, and 3, Newman Street, and 4 and 5, Perry's Place. They are the largest in the world, and contain such an assortment of FENDERS, STOVES, RANGES, FIRE-IRONS, and GENERAL IRONMONGERY as cannot be approached elsewhere, either for variety, novelty, beauty of design, or exquisiteness of workmanship. Bright Stoves, with bronzed ornaments and two sets of bars, 2*l.* 14*s.* to 5*l.* 10*s.*; ditto, with ormolu ornaments and two sets of bars, 5*l.* 10*s.* to 12*l.* 12*s.*; Bronzed Fenders complete, with standards, from 7*s.* to 3*l.*; Steel Fenders from 2*l.* 15*s.* to 6*l.*; ditto, with rich ormolu ornaments, from 2*l.* 15*s.* to 7*l.* 7*s.*; Fire-irons from 1*s.* 9*d.* the set to 4*l.* 4*s.* Sylvester and all other Patent Stoves, with radiating hearth plates. All which he is enabled to sell at these very reduced charges,

1st,—From the frequency and extent of his purchases; and,
2dly,—From those purchases being made exclusively for cash.

BATHS AND TOILETTE WARE.—WILLIAM S. BURTON has ONE LARGE SHOW ROOM devoted exclusively to the DISPLAY of BATHS and TOILETTE WARE. The stock of each is at once the largest, newest, and most varied ever submitted to the public, and marked at prices proportionate with those that have tended to make his establishment the most distinguished in this country. Portable Showers, 7*s.* 6*d.*; Pillar Showers, 3*l.* to 5*l.*; Nursery, 15*s.* to 32*s.*; Sponging, 15*s.* to 32*s.*; Hip, 14*s.* to 31*s.* 6*d.* A large assortment of Gas Furnace, Hot and Cold Plunge, Vapour, and Camp Shower Baths. Toilette Ware in great variety, from 15*s.* 6*d.* to 45*s.* the Set of Three.

THE BEST SHOW OF IRON BEDSTEADS in the Kingdom is WILLIAM S. BURTON'S.—He has two very Large Rooms, devoted to the exclusive show of Iron and Brass Bedsteads and Children's Cots, with appropriate Bedding and Mattresses. Common Iron Bedsteads, 18*s.*; Portable Folding Bedsteads from 12*s.* 6*d.*; Patent Iron Bedsteads, fitted with dovetail joints and patent sacking, from 17*s.* 6*d.*; and Cots from 20*s.* each; handsome Ornamental Iron and Brass Bedsteads, in great variety, from 2*l.* 13*s.* 6*d.* to 15*l.* 15*s.*

PAPIER MACHE AND IRON TEA-TRAYS.—An assortment of Tea Trays and Waiters wholly unprecedented, whether as to extent, variety, or novelty.

New oval Papier Maché Trays, per set of three	from 20*s.* to 10 guineas.
Ditto, Iron ditto	from 13*s.* to 4 guineas.
Convex shape, ditto.	from 7*s.* 6*d.*

Round and Gothic Waiters. Cake and Bread Baskets equally low.

WILLIAM S. BURTON has SIXTEEN LARGE SHOW ROOMS, all communicating, exclusive of the Shop, devoted solely to the show of GENERAL FURNISHING IRONMONGERY (including Cutlery, Nickel Silver, Plated and Japanned Wares, Iron and Brass Bedsteads and Bedding), so arranged and classified that purchasers may easily and at once make their selections.

Catalogues, with engravings, sent (per post) free. The money returned for every article not approved of.

No. 39, Oxford Street (corner of Newman Street); 1, 2, and 3, Newman Street; and 4 & 5, Perry's Place.

GLENFIELD PATENT STARCH, USED IN THE ROYAL LAUNDRY, AND PRONOUNCED BY HER MAJESTY'S LAUNDRESS TO BE THE FINEST STARCH SHE EVER USED.
Sold by all Chandlers, Grocers, &c. &c.

BERDOE'S LIGHT OVER-COATS and CAPES, Waterproof, yet Ventilating. Respectable and economical. Intended for general use, not merely for rainy weather. Capes, 30*s.* to 40*s.*; Coats, 40*s.* to 50*s.*
96, New Bond Street, and 69, Cornhill (only).

BUY OF THE MAKERS.—BRUSHES, COMBS, and BROOMS of every description, whether for the dressing table, household, or stable use, 30 per cent. lower than any other house in the trade, at the manufacturers, J. and J. WITHERS, 36, Tottenham Court Road (opposite Bedford Street, Bedford Square).—Warranted Tooth Brushes, 3*d.*; superior ditto, 4*d.*; the best that can be made, 6*d.* each.—N.B. The lowest price asked and no abatement.

METCALFE AND CO'S NEW PATTERN TOOTH BRUSH, PENETRATING HAIR BRUSHES, AND SMYRNA SPONGES.—The Tooth Brush performs the highly-important office of searching thoroughly into the divisions and cleansing in the most extraordinary manner—hairs never come loose. Peculiarly penetrating Hair Brushes, with durable unbleached Russian bristles, which will not soften like common hair, and immense stock of genuine unbleached Smyrna Sponge, with every description of British and Foreign Perfumery, at METCALFE, BINGLEY, & Co.'s only Establishment, 130 B and 131, Oxford Street, second and third doors west from Holles Street.

CAUTION.—Beware of the word "from" Metcalfe's, adopted by some houses. Metcalfe's Alkaline Tooth Powder, 2*s.* per box.

THE SUCCESSFUL RESULTS OF THE LAST HALF CENTURY HAVE PROVED BEYOND QUESTION THAT

ROWLAND'S MACASSAR OIL possesses peculiarly nourishing powers in the growth, restoration, and improvement of the human Hair, and is now universally acknowledged to be the cheapest, and superior to all other preparations for the hair. It prevents it from falling off or turning grey, strengthens weak hair, produces a thick and luxuriant growth, cleanses it from scurf and dandriff, and makes it beautifully soft, curly, and glossy. In the growth of the Beard, Whiskers, Eyebrows, and Moustachios, it is unfailing in its stimulative operation. For children it is especially recommended, as forming the basis of a beautiful head of hair. Price 3*s.* 6*d.* and 7*s.*; Family Bottles (equal to four small), 10*s.* 6*d.*; and double that size, 21*s.* CAUTION.—On the wrapper of each bottle are the words, Rowlands' Macassar Oil, in two lines.—Sold by A. ROWLAND & SONS, 20, Hatton Garden, London, and by Chemists and Perfumers.

DO YOU WANT LUXURIANT HAIR, WHISKERS, &c.?—No other compound for the Hair has maintained such an enduring celebrity as EMILY DEAN'S CRINILENE. It is guaranteed to produce Whiskers, Moustachios, Eyebrows, &c., in a few weeks, and restore the Hair in Baldness, from whatever cause, strengthen it when weak, prevent its falling off, and effectually check Greyness in all its stages.—Price 2*s.* per package (elegantly perfumed); sent post free, on receipt of 24 penny postage stamps, by Miss DEAN, 37 A, Manchester Street, Gray's Inn Road, London. Sold by every Chemist in the world.—"In one fortnight it produced a beautiful set of moustachios." H. ADAMS.—"It has prevented my hair falling off." J. HICKSON.—"It has quite checked the greyness that was coming on." MRS. ELDER.

Beware of imitations under closely similar names.

MESSRS. SHOOLBRED AND BRADSHAW, 34, Jermyn Street, PATENTEES—Manufacturers of every description of ELASTICAL SURGICAL BANDAGES, as recommended by all the most eminent surgeons—in acknowledging the very extensive support they have received, beg to call attention to the various improvements they are making in patent Elastic Stockings, Knee Caps, Socks, and Ladies and Gentlemen's Spine Supporters. A new description of Belt, invaluable for prevention of Cholera, and the cure of Rheumatism, Lumbago, &c. N.B. Every description of India-rubber Bandages vulcanised on the newest principle.

RUPTURES EFFECTUALLY CURED WITHOUT A TRUSS.—All sufferers from this alarming complaint are earnestly invited to consult or write to Dr. LESLIE, as he guarantees them relief in every case. His remedy has been successful in curing thousands of persons during the last twelve years, and is applicable to every kind of single and double rupture, however bad or long standing, in male or female of any age, causing no confinement or inconvenience in its use whatever. Sent post free to any part of the world, with full instructions for use, on receipt of 7*s.* 6*d.* in postage stamps, or post-office order, payable at the General Post-office, to Dr. HERBERT LESLIE, 37A, Manchester Street, Gray's Inn Road, London. At home daily (except Sunday) from 11 till 4 o'clock. A Pamphlet of Testimonials, cases, &c., sent post free on receipt of one postage stamp.

TO NERVOUS SUFFERERS.

A RETIRED CLERGYMAN having been restored to health in a few days, after many years of great nervous suffering, is anxious to communicate to others the means of cure; he will therefore send (free), on receiving a stamped envelope, properly addressed, a copy of the prescription used.—Direct Rev. E. DOUGLASS, 18, Holland Street, Brixton, London.

HOLLOWAY'S PILLS HAVE AN EXTRAORDINARY EFFECT ON LIVER AND STOMACH COMPLAINTS.—Mr. Charles Wilson, of 39, Princes Street, Glasgow, states in a letter to Professor HOLLOWAY that he had suffered for a long time from a disease of the liver and stomach, for which he could obtain no relief from the medical profession. Therefore he determined on trying Holloway's Pills, at which time he was in a most wretched condition, but humanly speaking, these Pills have saved his life, as he is now restored to perfect health, to the surprise of all who had witnessed the state he was in.—Sold by all Medicine Vendors, and at Professor HOLLOWAY'S Establishments, 244, Strand, London, and 80, Maiden Lane, New York.

MOST CONSOLATORY it is to know that a remedy exists, which, by destroying the germs of disease, prevents the development of those morbid and melancholy sensations which too often embitter the social relations of life.

PARR'S LIFE PILLS

are a sure antidote to those vices of the human system which engender painful maladies, the existence of which makes us discontented with everything around us. All who use Parr's Pills can fully appreciate the delightful sensations arising from the consciousness of possessing good health. In this respect they are most valuable, because they give elasticity and buoyancy to the animal spirits, and make us contented not only with ourselves but with our friends and associates. Many, perhaps, never reflect upon the importance of insuring a happy mind by taking care of the body's health, but a better appreciation of the science of health is one of the characteristics of these improving times. Ask for Parr's Life Pills.

London Agents: E. Edwards, 67, St. Paul's Churchyard; Barclay & Sons, 95, Farringdon Street; Sutton & Co., 10, Bow Churchyard; Hannay & Co., 63, and Sanger, 150, Oxford Street; and sold by all respectable chemists and medicine vendors in town or country, in boxes, price 1*s.* 1½*d.*, 2*s.* 9*d.*, and in family packets 11*s.* each

NO MORE PILLS NOR ANY OTHER MEDICINE.—FOR INDIGESTION (DYSPEPSIA), CONSTIPATION, NERVOUS, BILIOUS, AND LIVER COMPLAINTS, COUGH, ASTHMA, BRONCHITIS, CONSUMPTION, AND DEBILITY.

DU BARRY'S delicious REVALENTA ARABICA FOOD saves 50 times its cost in Medicine, and cures the above complaints and their consequences, such as flatulency, distension, acidity, heartburn, palpitation of the heart, nervous headaches, deafness, noises in the head and ears, pains at the pit of the stomach and between the shoulders, diarrhœa, dysentery, impurities and poverty of the blood, scrofula, asthma, dropsy, rheumatism, gout, nausea and sickness during pregnancy, after eating, or at sea; low spirits, spasms, cramps, epileptic fits, spleen, general debility, inquietude, sleeplessness, involuntary blushing, paralysis, tremors, dislike to society, unfitness for study, loss of memory, delusions, vertigo, blood to the head, exhaustion, melancholy, groundless fear, indecision. It is moreover the best food for infants and invalids generally, as it never purges or turns acid on the weakest stomach, nor interferes with a good liberal diet, but imparts a healthy relish for lunch and dinner, and restores the faculty of digestion, and nervous and muscular energy to the most enfeebled.

BARRY, DU BARRY & Co., 77, Regent Street, London.

A few out of 50,000 cures are here given:—

Cure No. 71, of Dyspepsia, from the RIGHT HON. THE LORD STUART DE DECIES, "I have derived considerable benefit from Du Barry's Revalenta Arabica Food, and consider it due to yourselves and to the public to authorise the publication of these lines. STUART DE DECIES."

From the DOWAGER COUNTESS OF CASTLESTUART.

Cure 52,612.—"Rosstrevor, County of Down, Ireland, Dec. 9, 1854.—The Dowager Countess of Castlestuart feels induced, in the interest of suffering humanity, to state that Du Barry's excellent Revalenta Arabica Food has cured her, after all Medicines had failed, of Indigestion, Bile, great nervousness and irritability of many years standing. This Food deserves the confidence of all sufferers, and may be considered a real blessing. Enquiries will be cheerfully answered."

Cure No. 49,832.—"Fifty years indescribable agony from dyspepsia, nervousness, asthma, cough, constipation, flatulency, spasms, sickness at the stomach and vomiting, have been removed by Du Barry's excellent food.

"MARIA JOLLY, Wortham Ling, near Diss, Norfolk."

Cure 52,422. "Bridgehouse, Frimley, April 3d, 1854.

"I have suffered these 33 years continually from diseased lungs, spitting of blood, liver derangement, deafness, singing in the ears, constipation, debility, shortness of breath, and cough, and during that period taken so much medicine that I can safely say I have laid out upwards of a thousand pounds at the chemist's and doctor's. Indeed I was in utter despair, and never expected to get over it, when I was fortunate enough to become acquainted with your Revalenta Arabica, which, Heaven be praised, restored me to a state of health which I long since despaired of attaining. My lungs, liver, stomach, head, and ears are all right, my hearing perfect, and my recovery is a marvel to all my acquaintances.

"JAMES ROBERTS, Wood Merchant."

From the VENERABLE ARCHDEACON of ROSS.

No. 32,836.—"Three years excessive nervousness, with pains in my neck and left arm, and general debility, which rendered my life very miserable, has been radically removed by Du Barry's health restoring food. ALEX. STUART."

Cure 48,615. "Plymouth, May 9th, 1851.

"For the last 10 years I have been suffering from dyspepsia, headaches, nervousness, low spirits, sleeplessness, and delusions, and swallowed an incredible amount of medicine without relief. I am happy to say that your Food has cured me, and I am now enjoying better health than I have had for many years past.

"J. S. NEWTON."

Cure No. 180.—"25 years nervousness, constipation, indigestion, and debility, from which I have suffered great misery, and which no medicine could remove or relieve, have been effectually cured by Du Barry's Food in a very short time.

"W. R. REEVES, Pool Anthony, Tiverton."

No. 4208.—"Eight years dyspepsia, nervousness, debility with cramps, spasms, and nausea, have been effectually removed by Du Barry's health-restoring food. I shall be happy to answer any inquiries.

"Rev. JOHN W. FLAVELL, Ridlington Rectory, Norfolk."

No. 42,130, Major General King, cure of general debility and nervousness. No. 32,110, Captain Parker D. Bingham, R.N., who was cured of 27 years' dyspepsia in six weeks time. Cure No. 28,416, William Hunt, Esq., Barrister-in-law, 60 years' partial paralysis. No. 32,814, Captain Allen, recording the cure of a lady from epileptic fits. No. 26,419, the Rev. Charles Kerr, a cure of functional disorders. No. 24,814, the Rev. Thomas Minster, cure of five years' nervousness, with spasms and daily vomitings. No. 41,617, Dr. James Shorland, late surgeon in the 96th Regiment, a cure of dropsy.

No. 37,403, Samuel Laxton, Esq., a cure of two years' diarrhœa. Mr. William Martin, a cure of eight years' daily vomiting. Richard Willoughby, Esq., a cure of many years' biliousness.

No. 58,034.—"Grammar School, Stevenage, December 16, 1850. "Gentlemen,—We have found it admirably adapted for infants. Our baby has never once had disordered bowels since taking it.

"R. AMBLER."

"59, Union Street, Third District, New Orleans, Mar. 13, 1855.

"Dear Sir—Since 1838 I had been afflicted with a complaint that neither I nor my physician could qualify. It first began by an excessive thirst, so that I was fain to drink daily from 30 to 40 tumblers of water, the greatest thirst being during the digestive process. A strange feeling above the fundament followed that unusual thirst. It came on with intolerable itchings, and next as if an edged tool was cutting into it. Afterwards as if a full-grown crab's claw were steadily pinching at me. These symptoms were followed by colic, and finally by a diarrhœa. Originally these paroxysms came on yearly; after a while, several times in the course of the year; and for some years back almost every month, until at last every week. So that for seventeen years I have been labouring under an insufferable affliction, deprived of sleep, and so dizzy at times that I could not help myself; my stomach would fail me, and I thus became a helpless enervated invalid. At last on the 15th of June, 1854, I was taken down with an alvine flux and killing pains in the bowels. Often as I went to bed at night I thought I should never see the morning. My medical attendant and friend, in whom was all my trust, concluding that he could do nothing to alleviate my sufferings (I thought so, at least), under colour of being himself unwell, sent me to one of his colleagues, whose attendance proved as unsuccessful: all the remedies prescribed failing to afford me any relief. It was at this stage of my disease that, on the 5th of September last, I luckily met one of my friends, who told me that Mr. J. B. Monier had passed through the same ordeal, and had been radically cured by Du Barry's Revalenta Arabica. Thereupon I immediately began to make use of it, and soon after felt relieved; and the extraordinary change for the better I have gradually experienced since, owing to that excellent farina, induces me to believe that I am completely cured. However as mine was a chronic disorder, I still keep taking the Revalenta, and will do so for some time yet, to insure a permanent return to health. Hoping that this statement may serve the cause of humanity, I cheerfully make it, and remain, yours respectfully, F. B. BERNARD,"

Commercial Abstract Clerk in the Collector's Office.

PROF. LIEBIG'S NEW WORK.

Just published, in small 8vo, price 3s. 6d. cloth,

PRINCIPLES
OF
AGRICULTURAL CHEMISTRY.

WITH SPECIAL REFERENCE TO THE LATE RESEARCHES MADE IN ENGLAND.

BY JUSTUS VON LIEBIG,

Professor of Chemistry in the University of Munich.

I cannot allow this little treatise to appear without expressing the very high gratification I have had in translating it, and thus assisting to lay it before the British public.

It is, so far as I can judge, by far the best of the author's writings on the important subject to which it refers.

Apart from all controversy, it contains, in the shape of 50 propositions, a most admirable summary of the true relation between Chemistry and Agriculture. These propositions are beyond all doubt true, so far as our present knowledge extends, and contain principles, the due appreciation and application of which is of the last importance to all who wish to cultivate Agriculture on true—that is, on scientific principles.

No doubt can be entertained by any one who has read the various memoirs published by writers opposed to the author's views that these views and the principles or doctrines he has hitherto laid down, have been generally misunderstood by these writers, and that failure and disappointment have been the natural results.

But in the 50 propositions now given to the world, the real doctrines of the author are so simply and clearly expressed that it is almost impossible not to understand and appreciate them; and it may be confidently expected that their promulgation will produce most beneficial results.

I trust that I may be allowed to express this hope, since these propositions embody, in a fuller and more extended form, those principles of Agricultural Chemistry, or rather of the science of Agriculture, which I have deduced from the author's writings, and which I have long taught in my lectures, frequently in the very words now used by their author. So strong is my conviction of the truth of these principles, that I regard it as certain that all real improvements in Agriculture will be found, on examination, to be referable to these principles or laws; and that, as Baron Liebig somewhere has said, "therein lies the whole future of Agriculture."

The present work demonstrates that the author's so-called "Mineral Theory" has been entirely misunderstood by Mr. Lawes, and that the experiments of the latter gentleman in all points really prove the truth of the "Theory," as it exists in the author's works. WILLIAM GREGORY,

Professor of Chemistry in the University of Edinburgh.

THE PELARGONIUM; or, Practical Observations on its Cultivation; to which is added, a Monthly Calendar of Operations. Second Edition, carefully revised, with additional information. By JOHN DOBSON, Woodlands Nursery, Isleworth, Middlesex.

London: HAMILTON, ADAMS & Co.; and all Booksellers.

Just published, the 33d edition, price 1d.,

GRIMSTONE'S HISTORY OF AN EGYPTIAN PEA, discovered by the Committee of the British Museum in a Vase sent by Sir Gardner Wilkinson, the Egyptian Traveller. Three were presented to Mr. W. Grimstone by Mr. T. Pettigrew, who opened this relic, being 2844 years old. The growth of this Pea is different to those of this country; the [illegible] is unequalled, they boil much greener than ours, and so prolific. They are planted thus . . . . eight inches apart: the 2s. 6d. bag will produce enough for a small family. They require no sticks, and the bloom hangs in clusters. The only genuine are sold in bags, 2s. 6d.; three times the quantity, 5s.; seven times the quantity, 10s. Each bag is signed and sealed by WILLIAM GRIMSTONE, Herbary, Highgate; depôt, 52, High Street, Bloomsbury, London, Eye Snuff and Herb Tobacco Warehouse, 3d. per ounce.

Just published, royal 4to., sewed, price 21s.

PRITZEL.—ICONUM BOTANICARUM INDEX. An Alphabetical Register of upwards of 80,000 representations (engraved) of phaneroganic plants and Ferns, compiled (with references) from the botanical and horticultural publications of the 18th and 19th centuries. 608 pages, double column, 1855. Price 21s.

London: WILLIAMS & NORGATE, Importers of Foreign Books, 14, Henrietta Street, Covent Garden.

Fourth edition, 12mo., 500 pages, beautifully printed, and elegantly bound, gilt edges, price 6s., also the Library Edition, 8vo., embellished with a Frontispiece after Raphael, engraved by Robinson, cloth or vellum paper, gilt edges, price 10s. 6d.,

TRUTHS ILLUSTRATED by GREAT AUTHORS: a Dictionary of 4000 Aids to Reflection, and Quotations in Prose and Verse, compiled from the works of the greatest writers, ancient and modern. "Every imaginable topic of interest or inquiry finds an apt illustration or felicitously selected apothegm."—*Globe.* Both editions are kept in extra calf and morocco bindings. London: W. WHITE, 70, Piccadilly, and all Booksellers.

New Work Edited by Dr. Lindley.

On June 1st will be published, PART III., price 6s., in handsome folio,

THE FERNS OF GREAT BRITAIN

NATURE-PRINTED (Life Size).

With Descriptions of the Indigenous Species and Varieties by THOMAS MOORE, F.L.S.

EXTRACTS FROM THE PRESS.

Daily News.—Nature-Printing excels all that can possibly be achieved by manual care and dexterity in the art of delineation, since in these leafy examples we find revealed minute and important features in the construction of the vegetable kingdom which elude the power even of photography.

Illustrated London News.—This work is important, not only for the scientific research displayed by the author in an extremely interesting branch of Natural History, but as the first instance of the application of a new and valuable process of imitation and reproduction, called "Nature-Printing." The plants being represented in relief, as it painted upon paper, and all the parts in their several appropriate colours, the result is a complete substitute for the original specimen. To the botanical student such a means of study must be invaluable.

Globe.—Such is the beauty and perfection of this mode of representation, that the very plants themselves seem adhering to the paper.

Examiner.—The plates are beautiful and curious. At first sight they look more like perfect and unfaded specimens from a good Hortus Siccus.

Press.—We can testify to the extreme delicacy and exactitude with which the forms of the various species of ferns are represented, so as, in fact, to convey the impression that the plants themselves have been transferred to paper.

Leader.—A most remarkable series of botanical illustrations.

Morning Advertiser.—By this process a vast improvement has been effected upon any of the methods previously in existence, inasmuch as it displays, with absolute accuracy, the minutiæ of superficial structure.

Observer.—Every ramification of the most minute vessels of the plant is given in these admirable prints, with an accuracy only attainable by Nature Printing; and all its peculiar features, picturesque as well as botanical, are shown in the most perfect manner.

Sunday Times.—The ostensible purpose of the work—is to furnish a complete history and classification of the British Ferns.

*** *The Work is being issued Monthly, and will be completed in about 16 Parts. Parts I. and II. are already published, price 6s. each, and containing Three Nature-Printed Plates.*

BRADBURY & EVANS, 11, BOUVERIE STREET.

In a few days will be published, price 4s. 6d.,

THE CRICKET FIELD; or, the Science and History of the Game of Cricket. By the Author of "The Principles of Scientific Batting," &c. The second edition, greatly improved by various additions and corrections.

London: LONGMAN, BROWN, GREEN, & LONGMANS.

NEW AND ENLARGED EDITION OF DR. LINDLEY'S THEORY OF HORTICULTURE.

Now ready, in 8vo, with 98 Woodcuts, price 21s. cloth,

THE THEORY AND PRACTICE OF HORTICULTURE: or, an Attempt to explain the chief Operations of Gardening upon Physiological Grounds: being the Second Edition of the "Theory of Horticulture," much enlarged. By JOHN LINDLEY, Ph.D., F.R.S., Corresponding Member of the Institute, Vice-Secretary of the Horticultural Society, Professor of Botany in University College, London, &c.

CONTENTS.

BOOK I.—The principal Circumstances connected with Vegetable Life which illustrate the Operations of Gardening:—

1. Vital Force
2. Germination
3. Growth by the Root
4. Growth by the Stem
5. Action of Leaves
6. Action of Flowers
7. The Maturation of the Fruit
8. Temperature.

BOOK II.—The Physiological Principles upon which the Operations of Horticulture essentially depend:—

1. Bottom Heat
2. Moisture of the Soil, Watering
3. Atmospherical Moisture and Temperature
4. Ventilation
5. Seed Sowing
6. Seed Saving
7. Seed Packing and Plant Packing
8. Propagation by Eyes and Buds
9. Propagation by mere Leaves
10. Propagation by Cuttings
11. Propagation by Layers and Suckers
12. Propagation by Budding and Grafting
13. Pruning
14. Training
15. Potting
16. Transplanting
17. The Preservation of Race by Seed
18. The Improvement of Races
19. Resting
20. Soil
21. Manure

"The author has always felt that the naked principles laid down in the First Edition of this work were less interesting than they would have been if they had received more extensive illustration from examples and frequent reference to practical operations. He has now therefore greatly extended the matter, and illustrated, whenever it appeared necessary, to support the doctrines of Physiology by an appeal to facts which are or should be familiar to all cultivators."—*Extract from Preface to Second Edition.*

By the same Author,

INTRODUCTION TO BOTANY. 4th Edition, greatly enlarged; with 6 Plates, and numerous Wood Engravings. Two vols. 8vo. 24s.

*** It has been the Author's wish to bring every subject that he has introduced down, as nearly as possible, to the state in which it is found at the present day. In doing so, he has added a very considerable quantity of new matter, especially that which relates to Vegetable Anatomy and Physiology, that the present Edition may be considered, in those respects, a new work.

A SYNOPSIS OF THE BRITISH FLORA; arranged according to the Natural Orders; containing Vasculares, or Flowering Plants. Third Edition, with numerous Additions, Corrections, and Improvements. 12mo, 10s. 6d.

London: LONGMAN, BROWN, GREEN, and LONGMANS.

On June 1, No. I., with 180 beautifully coloured figures, price 3s. 6d.,

WOOD'S INDEX TESTACEOLOGICUS, an Illustrated Catalogue of all known Shells, with their Synonyms, Localities, &c. Enlarged by SYLVANUS HANLEY, Esq. The most complete work on Conchology and the best for reference. This revised edition contains numerous new figures, and with the improved letter-press, must supersede the former ones. To be published monthly, each number containing about 150 coloured figures.

G. WILLIS, Piazza, Covent Garden; and of all Booksellers.

On June 1, No. I. of the reissue, containing 109 beautifully coloured figures, price 3s. 6d.,

WOOD'S INDEX ENTOMOLOGICUS, a complete Illustrated Catalogue of British Moths and Butterflies, with their Synonyms, Localities, &c. New edition, enlarged, by J. O. WESTWOOD, Esq. This beautiful publication is the most complete Illustrated Work on British Entomology, containing nearly 2000 coloured figures, including 180 new ones. It can also be had complete, in one large volume, royal 8vo, half morocco, 4l. 4s.

G. WILLIS, Great Piazza, Covent Garden.

A FEW SETS FOR SALE.

Embellished with 700 splendid coloured engravings,

PAXTON'S (Sir J.) MAGAZINE OF BOTANY AND FLOWERING PLANTS. A complete set of this elegant and valuable work from its commencement. 16 large vols., royal 8vo, half morocco, gilt leaves, new, price only 14l. 14s.; published at 28l. 15s.

The advertiser having purchased the few remaining copies of the above beautiful and esteemed work, begs to call attention to its present reduced price. As the number for sale is very small, early application is desirable.

G. WILLIS, Great Piazza, Covent Garden.

Now ready, with Six beautifully coloured Plates, Part X. price 4s., containing the Genus Orchis,

ORCHIDACEOUS PLANTS, Coloured Illustrations of, comprising Figures of the most interesting and beautiful Genera, with Descriptions of all the Cultivated Species, and Directions for their Cultivation. Edited by T. MOORE, F.L.S. The former numbers contain the Genera Miltonia, Brassia, Paxtonia, Spathoglottis, Sobralia, Cœlogyne, Epidendrum, Vanda, Coryanthes, Sarcopodium, Odontoglossum, and Stanhopea. Part XI. on June 1.

G. WILLIS, Great Piazza, Covent Garden.

ON NERVOUSNESS, DEBILITY, AND INDIGESTION.

Just published, new and cheaper Edition, price 1s., or 1s. 6d. by post,

THE SCIENCE OF LIFE; Or How to Live and What to Live For, with ample rules for Diet, Regimen, and Self-Management, together with instructions for securing health, longevity, and that sterling happiness only attainable through the judicious observance of a well regulated course of life. By A PHYSICIAN.

London: PIPER, BROTHERS, & Co., 23, Paternoster Row; HANNAY, 63, Oxford Street; MANN, 39, Cornhill; and all Booksellers.

PRACTICAL MECHANICS' JOURNAL, Part LXXXVI., MAY, 1855, 1s., contains,

HEBERT, 88, Cheapside, London; Editor's Office (Office for Patents), 47, Lincoln's Inn Fields.

TURNHAM GREEN, MIDDLESEX.

TO FLORISTS, FRUITERERS, &c.

TO BE LET upon Lease, or for shorter periods, with immediate possession, a convenient BUSINESS PREMISES, comprising a commodious Shop and Cellar, excellent Conservatory, a Six Room Dwelling with Garden, and good Greenhouse behind. The property fronts the high road from London to Brentford in a very respectable neighbourhood, suitable for a Florist and Fruiterer's Business combined. The stock, comprising Geraniums, Cacti, and various plants, may be taken at a valuation.—For particulars apply to Mr. ATWOOD, Land Agent, Mortlake, Surrey; or Mrs. HAMILTON, John Bull Inn, Gunnersbury Place, Turnham Green.

VALUABLE ESTATE.

TO BE SOLD, a FIRST-CLASS ESTATE of the richest land, with a clear rental of near 5000l. a year; no expensive place to keep up, close to a Railway and Seaport, and about 60 miles from London.—Apply to Mr. JAMES CAIRD, 6, Serjeant's Inn, Temple.

TO GENTLEMEN'S GARDENERS AND OTHERS.

TO BE SOLD, the STOCK and GOODWILL of a SHOP in a leading thoroughfare, with a good Ready Money Retail Business in the Seed, Plant, and Herb Trade, which may be greatly increased by one who understands jobbing.—Address, by letter only, J. M., 3, Jamaica Place, Camberwell New Road, Kennington, Surrey.

SHORT HORN COW (in Calf) and HEIFER for Sale.—Pure Ayrshire and remarkably handsome, worthy the attention of fancy stock breeders.—Apply for price, &c., to LEWIN WHITE, Sutton, Surrey.

DORKING BLUE MOTTLED FOWLS' EGGS, 12s. per dozen. Took first Prize at Brighton Exhibition of three counties, 1854.—Address Mr. ED. HENDEN, Beehive Inn, Dorking, Surrey.

Sales by Auction.

TO GENTLEMEN, FLORISTS, AND OTHERS.

MESSRS. PROTHEROE AND MORRIS will Sell by Auction, at the Mart, Bartholomew Lane, on WEDNESDAY, May 23, and FRIDAY, May 25, at 12 o'clock, a first-rate collection of Dahlias, Fuchsias, Climbing and other Roses, fine Calceolarias, Geraniums, and other Plants in bloom, Carnations and Picotees, with a large assortment of Plants for Bedding.—May be viewed the morning of Sale; Catalogues had at the Mart, and of the Auctioneers, American Nursery, Leytonstone, Essex.

BLACKHEATH.—SECOND SALE.

To NOBLEMEN, GENTLEMEN, NURSERYMEN, AND OTHERS.

MESSRS. PROTHEROE AND MORRIS are instructed to sell by Auction, in the Lecture Hall adjoining the Blackheath Station of the North Kent Railway, on THURSDAY, May 24th, at 1 o'clock, about 8000 BEDDING and other GREENHOUSE PLANTS, comprising a choice collection of Fancy and other Pelargoniums, Tom Thumb, and Scarlet Geraniums in varieties; Heliotropes, Calceolarias, Petunias, Fuchsias, Verbenas, Lobelias, Pentstemons, Phlox, Dahlias, &c.—May be viewed the day previous to the Sale. Catalogues may be had on the premises; of Mr. Drouet, Crown Inn, Tranquil Vale, Blackheath; of the principal Seedsmen in London; and of the Auctioneers, American Nursery, Leytonstone, Essex.

MILE-END NURSERY, BOW.

To GENTLEMEN, NURSERYMEN, FLORISTS, AND OTHERS.

MESSRS. PROTHEROE AND MORRIS are directed to Sell by Auction, on the Premises, Mile-End Nursery, Bow Road, Middlesex, on MONDAY and TUESDAY, May 21st and 22d, at 12 o'clock, about 12,000 BEDDING and other GREENHOUSE PLANTS, consisting of fine Show and Scarlet Geraniums, Genista, Cactus, Hydrangea, Calla, Verbenas, Fuchsias, Heliotropium, Salvia, Calceolarias sorts, Petunias, Mimulus, Nierembergia, Lobelia, Erinus, Phlox Drummondi, Cuphea, Ageratum, and Gallardia; Dahlias, Chrysanthemums, Intermediate Stocks, Maurandya, Tropæolum, Cobæa, Lophospermum, Ecremocarpus, &c. May be viewed three days previous to the Sale.—Catalogues may be had on the Premises; of the principal Seedsmen in London: and of the Auctioneers, American Nursery, Leytonstone, Essex.

TULIPS IN BLOOM.

MESSRS. PROTHEROE AND MORRIS will sell by Auction, without the least reserve, on MONDAY, May 28, at 1 o'clock precisely, the ENTIRE COLLECTION of TULIPS in BLOOM of Mr. John Edwards, and now growing at the Paradise Nursery, Hornsey, and Seven Sisters Road, Holloway, Middlesex, where by the kind permission of Mr. Robert Parker, they may from time to time be seen. The bed is 200 rows in length, and contains over 2000 full sized first class Blooming Bulbs, including most of the show flowers extant, all of the finest strain, and collected during the last 12 years at a cost exceeding 1000 guineas.

Catalogues may be had for two postage stamps of Mr. R. Parker, as above; of Mr. Turner, Royal Nursery, Slough; Mr. J. Keynes, Salisbury; Mr. Wood, the Coppice, Nottingham; Mr. E. S. Dodwell, Derby; Mr. Lightbody, Falkirk, N.B.; Mr. Slater, Cheetham Hill, Manchester; at the Office of this Paper; and of the Auctioneers, American Nursery, Leytonstone, Essex.

MITCHAM.—TO TULIP FANCIERS.

MESSRS. PROTHEROE AND MORRIS have received instructions from Mr. Goldham to submit to public competition by auction, without reserve, on the premises, Ilynder Cottage, Merton Lane, Mitcham, Surrey, on SATURDAY, May 26, at 1 o'clock, a portion of his costly and unrivalled Collection of TULIPS. No comment on this magnificent stock will be equal to an inspection of its striking beauties, for which an opportunity is now offered to the amateur florist, &c. New Flowers and Seedlings of Mr. Goldham's raising—the result of more than 30 years' successful cultivation and competition; among these are—Fanny Kemble, John Kemble, Charles Kemble, Julius Cæsar, Napoleon, Fortunatus, Gem, Duchess of Sutherland, Standard, Lord Byron, Marshal Soult, Marshal Blucher, Emma, Calphurnia, Oliver Goldsmith, Othello, Comet, Biz. Mark Antony, Sir R. Peel, Helen, Lord Nelson, Picturata, Unique, Byb. Belvidera, Juliet, Marquis of Anglesea, Unique Rose, and Mount Hecla. Among Flowers raised by other growers are—Pandora, Thalia, Musidora, Matilda (new), Lord J. Russell, Apelles, Duke of Devonshire, Mrs. Siddons, Feu devorent, Stein's Victoria, Strong's Eliza, St. Neots, Fanny Ellsler, Parmeziano, General Bournonville, Louis XVI., Polydora, Wallace, Rutley's Queen, Duchess of Manchester, Commodora, Lord Collingwood, &c.—May be viewed two days prior to the Sale; Catalogues had on the premises; of the principal Seedsmen in London, and of the Auctioneers, American Nursery, Leytonstone, Essex.

IMPORTANT SALE OF TULIPS.

MR. WILLMER begs to inform the Cultivators of the Tulip that he has received instructions from Mr. R. J. Lawrence, of Hampton, Middlesex, to submit to Auction, at the Lion Hotel, Hampton, on FRIDAY, June 1, 1855, at One o'clock, 100 ROWS of his BEST BED, containing nearly every flower worthy a place in a first-rate Collection. Those who have been in the habit of seeing the magnificent bed grown at the Lion Hotel, Hampton, will not require to be reminded of the splendid varieties it contains, but the following selection will give those who have not some idea of the class of flowers now offered:—George Haward (seedling, obtained a First Class Certificate at the National Tulip Show, 1854.) Byzantium, Lac, Pandora, Charles Brown, Rose Arlette, Strong's King, Thalia, Iago, Selim, Lady Exeter, Queen of the North, Jeffry's Elizabeth, Maid of Orleans, Lady Sale, Salvator Rosa, Achilles, Everard, Lady Wildair, Nero, Madonna, Vicar of Radford, Lady Denbigh, Lord John Russell (Byblon), Vivid, Beteral's Brulante, Clarissima, Delaforce's King, Franklin's Victory, Lord Dufferin, Elthiron, Goldham's Mary Ann, Nora Creena, Glory of Abingdon, Scarnell's Bijou, &c. Catalogues will be ready in a few days, and will be forwarded to any address, on application (inclosing a postage stamp) to Mr. Lawrence, Lion Hotel, Hampton, or the Auctioneer, Sunbury, Middlesex.

N.B.—The Grand Exhibition of Flowers at the Crystal Palace will be held on Saturday, the 2d of June, so that Gentlemen from the Country will have an opportunity of attending the Sale and Show at one expense.

HORTICULTURAL BUILDING AND HEATING BY HOT WATER.

AT THE LOWEST PRICES CONSISTENT WITH GOOD MATERIALS & WORKMANSHIP.

GRAY & ORMSON, DANVERS STREET, CHELSEA, LONDON.

GRAY AND ORMSON, Danvers Street, Chelsea, having had considerable experience in the construction of Horticultural Erections, which, for elegance of design, good materials, and workmanship, combined with economy and practical adaptation, cannot be surpassed by anything of the kind in the country, are in a position to execute orders on the lowest possible terms.

G. & O. have been extensively employed by the Nobility, Gentry, and London Nurserymen; and they can with the greatest confidence give the most satisfactory references to all by whom they have been favoured with orders. Their Hot-water Apparatus is also constructed on the most approved and scientific principles, for all purposes to which the application of Heating by Hot Water can be made available.

COTTAM & HALLEN. ENGINEERS. FOUNDERS ETC

2, WINSLEY STREET, & 76, OXFORD STREET, LONDON.

Hot Water Apparatus	Ornamental Wire Work	Hurdles	Do. Rollers	Watering Pots
Garden Vases	Flower Stands	Garden Chairs	Flower Labels	Garden Arches, &c.

IRON HURDLES, STRAINED WIRE FENCING, GAME NETTING, &c.

AGRICULTURAL LIST UPON APPLICATION.

EVERY DESCRIPTION OF PLAIN, ORNAMENTAL, CAST AND WROUGHT IRON, AND WIRE WORK,

EXHIBITION PRIZE MEDAL GATES AND ENAMELLED MANGERS.

READ'S GARDEN ENGINES, SYRINGES, &c.

WHEN an article of real utility attracts public attention, IMITATORS start into the field to snatch from the inventor the just reward of his labours. It has now become a daily practice of exhibiting in the windows of ironmongers and other, Syringes of the VERY COMMONEST DESCRIPTION, with the words "READ'S PATENT," as an inducement to purchasers. This, as an eminent writer on Horticulture has recently remarked on the subject, is indeed "living upon another man's fame."

READ'S Instruments have the ROYAL ARMS, with the Address—35, REGENT CIRCUS, LONDON.

*** A liberal discount allowed to Nurserymen, Seedsmen, &c., &c.—Descriptions sent Post free.

FOR WATERING GARDENS.

HANCOCK'S IMPROVED VULCANISED INDIA-RUBBER HOSE AND TUBING is now manufactured especially for the above purpose; is of greater durability than any other description of Hose; is capable of resisting great pressure, and made suitable for attaching to the mains of water-works, or to tanks of high elevations.

WATERING HOSE fitted up with the necessary brass joints, *stop-cocks, branches,* and *spreaders complete.*

VULCANISED INDIA-RUBBER SUCTION PIPES, made any length or size for Pumps or Garden Engines.

VULCANISED RUBBER WASHERS, and also in Sheet, any thickness, for all kinds of steam and water joints, or made any size or figure to order.

All communications and orders punctually attended to, addressed to the Manufactory, JAS. LYNE HANCOCK, Goswell Road, London.

WATER YOUR GARDENS WITH THE PATENT FLEXIBLE GUTTA PERCHA TUBING, from 4d. per foot. Roses, from 4s.

Union Joints, from 1s. 6d. each, fitted complete.

Instructions given to affix joints to Tape.

Post Office Orders payable at City Road Branch.

JAMES W. WATTS, Factory, 27, City Road, London.

THE IMPROVED PATENT GARDEN, WATER AND ROLLING ENGINE may be seen in the Agricultural Department at the CRYSTAL PALACE, SYDENHAM.

The threefold use of this neat little Machine must be obvious in Watering, Rolling, or Syringing; it will throw about a fine and is so portable that any ordinary domestic may use it; it contains about 20 gallons. Price 5*l.* 10*s.*

May be had at J. DORE's Manufactory, 17, Exmouth Street, Clerkenwell, London.

"FRIGI DOMO."—Patronised by her Majesty the Queen, the Duke of Northumberland for Syon House, His Grace the Duke of Devonshire for Chiswick Gardens, Professor Lindley for the Horticultural Society, Sir Joseph Paxton for the Crystal Palace, Royal Zoological Society, Mrs. Lawrence, Ealing Park, and — Collier, Esq., of Dartford.

PROTECTION FROM MORNING FROST.

"FRIGI DOMO," a Canvas made of patent prepared Hair and Wool, a perfect non-conductor of Heat and Cold, keeping wherever it is applied, a fixed temperature. It is adapted for all horticultural and floricultural purposes, for preserving Fruit and Flowers from the scorching rays of the sun, from wind from attacks of insects and from morning frosts. To be had in any required length, 2 yards wide, at 1*s.* 6*d.* per yard run, of Messrs. THOMAS ARCHER, whole and sole manufacturer, 7, Trinity Lane, Cannon Street, City, and the Royal Mills, Wandsworth, Surrey, and of all Nurserymen and Seedsmen throughout the kingdom.

"It is much cheaper than mats as a covering."

Printed by WILLIAM BRADBURY, of No. 13, Upper Woburn Place, in the Parish of St. Pancras, and FREDERICK MULLETT EVANS, of No. 27, Vincent Street, in the Parish of St. Margaret and St. John, Westminster, both in the County of Middlesex, Printers, at their Office in Lombard Street, in the Precinct of Whitefriars, in the City of London; and published by them at the Office, No. 5, Charles Street, in the Parish of St. Paul's, Covent Garden, in the said County, where all Advertisements and Communications are to be ADDRESSED TO THE EDITOR.—SATURDAY, May 19, 1855.

THE GARDENERS' CHRONICLE AND AGRICULTURAL GAZETTE.

SUPERIOR EARLY BROCCOLI.
MITCHINSON'S PENZANCE OR EARLY WHITE CORNISH BROCCOLI.—*Celebrated and invaluable for its earliness, coming into use early in February, a full-sized handsome head of excellent quality, but a shy seeder.*
Parties who were too late to procure seeds of this valuable Early Broccoli can now be supplied with good healthy PLANTS at 2*s*. 6*d*. per 100, carriage free, by sending immediate orders to the undersigned, or their Agents in London. For testimonials and names of Agents see former advertisements.
JOHN MITCHINSON & Co., Seed Merchants, Truro, Cornwall.

PELARGONIUMS, ETC.
HENRY GROOM, Clapham Rise, near London, by appointment FLORIST TO HER MAJESTY, begs to say that his Spring CATALOGUE OF PELARGONIUMS, &c., is ready, and will be forwarded on application.

DAHLIAS.
J. KEYNES is now sending out his New DAHLIAS for this season, and solicits the orders of his friends. Fine Plants may also be had of those splendid Dahlias sent out by him last season, at reasonable prices. Catalogues sent on application.—Castle Street Nursery, Salisbury.

SUPERB HOLLYHOCKS, SEEDS, ETC.
WILLIAM CHATER begs to offer packets of seed, consisting of 20 varieties, from his best Show Hollyhocks at 5*s*.; 12 varieties, 2*s*. 6*d*.; and from good double sorts, 1*s*.
Superior Quilled German and French Asters, in 12 varieties, mixed, 1*s*. per packet; separate, 2*s*. Fine Quilled African Marigolds, 6*d*. per packet.—Saffron Walden Nurseries.

BOSSOM'S CHAMPION OF ENGLAND CELERY.
THE finest Celery yet introduced, beautifully white, very crisp and solid, and withstands a greater amount of frost than any other known variety; it has been blanched in the ground 3 feet.—To be obtained of T. F. WINSTANLEY, Seedsman, 28, Market Place, Manchester, price 2*s*. 6*d*. per packet: prices to the trade on application.

JOHN HOLLAND has Superb SHOW PANSIES at 4*s*. and 6*s*. per dozen plants.
Selected PANSY SEED, 1*s*. and 2*s*. per packet.
Descriptive Catalogues now ready.
JOHN HOLLAND, Bradshaw Gardens, Middleton, Lancashire.

NEW WHITE VERBENA, MRS. HOLFORD.—This is the largest and most noble flower ever offered to the public, a single pip measuring an inch in diameter; the habit of the plant is good, with large truss; it is a free blooming variety. To be sent out first week in June, at 5*s*. per plant. The stock is very limited, therefore early orders are solicited to prevent disappointment. Also a large stock of Pelargoniums, Azaleas, Calceolarias, Mimulas, &c., are now in flower.
N. G. has a very large quantity of Bedding Plants ready for sale at low prices.
N. GAINES, Nursery, Surrey Lane, Battersea, near London.

MAY'S MAGNUM BONUM LETTUCE is by far the largest, sweetest, and crispest Lettuce known, in proof of which we possess numerous letters received from parties who had it last season. The addresses of the writers can be had on application. It may be sown all the summer, and will stand the winter. Packets 1*s*. each.
HENRY MAY, the Hope Nurseries, near Bedale, Yorkshire.

NOTTING HILL, KENSINGTON.
W. TOWNSEND having a large stock of BEDDING PLANTS, consisting of Verbenas, Heliotropes, Fuchsias, Calceolarias, Lobelias, Petunias, &c., &c., is enabled to supply strong plants in 4-inch pots at 1*l*. per 100, delivered free at any of the London Railways, packing not included.

T. F. WINSTANLEY'S BEDDING PLANT LIST is now ready, and can be had on application, or freely post.—28, Market Place, Manchester.

EDWARD PARKE FRANCIS offers the following Bedding-out Plants, strong and vigorous, from 3*s*. to 4*s*. and 6*s*. per dozen:—Scarlet Geraniums, Flower of the Day ditto, Verbenas, Calceolarias, Salvias, Heliotropes, Fuchsias, Petunias, Lobelias, Anagallis, Ageratum, Cupheas, &c. Carriage paid to London.—Rose Nurseries, Hertford.

STRONG BEDDING AND OTHER PLANTS.
F. AND A. SMITH'S Descriptive LIST of the undermentioned is now ready, and may be had, post free, on application:—Antirrhinums, Verbenas, Fuchsias, Scarlet Geraniums, Calceolarias, Petunias, Heliotropes, Pentstemons, Chrysanthemums, Mimulus, Salvias, Lobelias, &c. Climbers in variety; also a miscellaneous Collection of Greenhouse Plants. They have now in bloom Verbenas, Fuchsias, spotted Calceolarias, Cactus, Geraniums, Nerium splendens, Hydrangea hortensis, Mignonette &c. The Trade supplied.—Dulwich, Surrey, May 26.

CABBAGE PLANTS.
THOMAS WELLAND, Surrey Gardens, near Godalming, Surrey, offers fine Garden Plants and Drumheads for cattle, safely packed for any part of Great Britain, at 3*s*. 6*d*. per 1000. Crates, &c., delivered at station free.

HART AND NICKLIN, FLORISTS, &c., Guildford, offer the following Plants (free by post) at 8*s* per doz.:—
FUCHSIAS.—Omega, Vanguard, The Perfect Globe, Commodore, Duke of Wellington, Telegraph, Queen of Hanover, Charmer, Glory, Mrs. Patison, Premier, and Princess.
PANSIES.—Great Western, National, Sultan, Adela, Sir J. Paxton, British Queen, Duke of Perth, Marchioness of Bath, Alfred the Great, Boadicea, Pompey, and Pearl.

NEW SCARLET GERANIUM—EMPEROR NAPOLEON.
JOHN BUTCHER is now sending out the above splendid Geranium, a very decided improvement upon the great favourite Tom Thumb; the habit is more compact, the trusses of flowers very much larger, and for brilliancy of colour far superior; sending up the truss of flower finely above the foliage. Fine for Bedding or Vases. Good Plants, fit for immediate Bedding, 18*s*. per doz.; extra, 2*s*. 6*d*. each, basket included.
Nursery, Stratford-on-Avon, May 26.

WHEELER AND SON'S SHORT SELECT SEED LIST.—Our Priced List of Seeds for this season, containing Descriptions and Prices of the best GARDEN and FLOWER SEEDS, will be forwarded free by post. It is our earnest endeavour to send out all Seeds, whether for the Garden or Farm, of the very best quality and true to name: and as many of the Seeds are our own growing, and are proved before sending out, we generally succeed in giving entire satisfaction to our customers.
We are in daily receipt of most gratifying letters and renewed orders from those we had the honour of supplying last year, and as we deliver our Seeds CARRIAGE FREE, we very respectfully solicit the honour of an order from those who have not yet given us a trial.—J. C. WHEELER & SON, Gloucester, Seedsmen to the Gloucestershire Agricultural Society.

CHOICE BEDDING-OUT PLANTS,

And to those about Permanently Replenishing the Flower Garden.

YOUELL AND CO. beg to submit the following List of desirable PLANTS, suitable for the above purpose. Carriage paid on all Orders of 2*l.* and upwards to any distance within 150 miles of the Nursery, and good Plants added to compensate for this charge on packages of less value:—

„ Lindleyana, a decided lilac do. 6*s.* „

VERBENAS.—In this class particular attention has been given to introduce only those of the more striking colours and best habits for bedding purposes; these include all the handsomest of the new continental varieties, and we offer them at 4*s.* per dozen, or 30*s.* per 100.
Pansies, first class varieties, by name, 9*s.* per dozen.
Anagallis rubra, and grandiflora, 6*s.* per dozen.
Nierembergia filicaulis, 6*s.* per dozen.
Pentstemon azureum, 9*s.* per dozen.
„ of sorts, 6*s.* per dozen.
Salvia Lilleana, light blue, quite hardy, 9*s.* per dozen.
„ of sorts, 6*s.* per dozen.
Campanula corallina, hardy trailing plant, bearing in profusion light blue star-shaped flowers, 6*s.* per dozen.
Silene maritima pleno, hardy plant, of trailing habit, producing large double white flowers, 6*s.* per dozen.
Genista tinctoria flore pleno, another very hardy showy herbaceous plant, of trailing habit, producing large quantities of double flowers of deep orange colour, 6*s.* per dozen.
TROPÆOLUM—Triomphe de Gand—a handsome variety for trellis work, producing large and brilliant scarlet flowers, 12*s.* per dozen.
CLEMATIS TUBULOSA MONGOLICA, a handsome herbaceous plant bearing numerous heads of blue star-shaped flowers, very hardy, 9*s.* per dozen.
Clematis azurea grandiflora, Sieboldi, Hendersoni, and montana, these favourite hardy Climbers, in flowering plants, 1*s.* 6*d.* each.
ROCKETS, new double crimson, 9*s.* per dozen; old double white, 3*s.* per dozen.
PRIMROSES, double white, 4*s.* per dozen; double crimson or maroon, 12*s.* do.; double yellow, 5*s.* do.; double purple, 4*s.* do.
PHLOXES.—The following choice varieties 9*s.* per dozen:—Maria Boulanger, Striata superba, Roi Leopold, Villaret joyeuse, Bois Rose, Imbricata, Macrantha, Deuil de la Comtesse de Marne, Anais, Eliza, Mrs. Thompson, Madame Courcelles, Madame Frobel, Madame Lanier, Madame de Pruines, Gen. Lamoricière, Princesse de Cleres, Princesse Marianne, and other fine kinds.
HOLLYHOCKS, extra fine, first-class show varieties by name, 12*s.* to 18*s.* per dozen.
BELGIAN DAISIES in 36 best kinds, by name, 4*s.* per doz.
PEONIAS in 20 new and very choice Continental varieties, for 1*s.*
Delphinium Hendersoni, this magnificent bright blue variety, in flowering plants, 2*s.* 6*d.* each.
Dielytra spectabilis; this universal favourite, strong flowering plants, 9*s.* per dozen.
Delphinium Barlowi, 9*s.* per dozen.
„ Mooreanum, an extremely beautiful variety, 12*s.* per doz.
„ grandiflorum maximum, 9*s.* per dozen.
Saponaria ocymoides, very hardy rock plant, with pink flowers, 6*s.* per dozen.
Statice maritima rosea, a very pretty, hardy herbaceous plant of dwarf habit, producing numerous heads of bright rose-coloured flowers, 6*s.* per dozen.
Statice latifolia, fine hardy species, with blue flowers, 6*s.* per doz.
Hardy Heaths, 6*s.* per dozen.
MIMULUS in 6 new and choice varieties, 6*s.* per dozen.
POTENTILLAS in fine variety, 6*s.* per dozen.
Lilium lancifolium album, 9*s.* per dozen; rubrum, 20*s.* per dozen.
Lobelia Feu du Roi, St. Clair, and Aurora, 9*s.* per dozen.
Herbaceous Plants in very choice variety, 30*s.* per 100; or 6*s.* per dozen.
Alpine or Rock Plants, in choice variety, 4*s.* to 6*s.* per dozen.

YOUELL & Co., Royal Nursery, Great Yarmouth.

SEEDS OF SELECT HARDY PLANTS.

WILLIAM MOORE begs to offer the following SEEDS, all saved at the establishment, and warranted good, at 6*d.* per packet, or the collection for 5*s.* Payment to be made in postage stamps.

Scarlet Poppy Anemone.	Geum splendens.
Alstroemeria aurea.	Helianthemum, 10 sorts mixed.
Anchusa italica.	Lupinus magnificus.
Antirrhinum, fine striped.	Myosotis sylvaticum, fine sp.
Dianthus montana, rubra & alba.	Potentilla bicolor grandiflora.
German Wall-flower, fine mixed.	Polyanthus from the best sorts.

Norfolk Nursery, East Dereham.

BASS AND BROWN have just published a SUPPLEMENT TO THEIR CATALOGUES, with extracts and descriptions of a few new and select plants, which may be had on application.

☞ An extensive Stock of the finest and most popular and showy Bedding Plants, strong and well established, at low prices.

Wellingtonia gigantea, small, 5*s.* each.
„ „ well established plants, 7*s.* 6*d.* each.
„ „ very fine, in 24's, or 8-inch pots; these are some of the finest plants there are for sale, 42*s.* each.

All orders from unknown correspondents must be accompanied by a remittance or reference.—Nurseries, Westerham, Kent.

BEDDING PLANTS.—At 2*s.* 6*d.* per Doz.

JOHN SCOTT, Merriott Nurseries, Crewkerne, Somerset (established 1728), has nearly 20,000, in 3-inch pots, ready to be sent out. Post-office Orders payable at Crewkerne. (Baskets and Package at the Expense of Purchaser and not returnable.)

200 Sorts of the best and newest Verbenas.
120 do. Scarlet and other Bedding Geraniums.
20 do. Variegated leaved ditto.
100 do. Fuchsia, all the best; 24 do. Shrubby Calceolarias; 24 do. Petunias; with Anagallis, Ageratums, Cupheas, Heliotropes, Lobelias, Salvias, Senecios, &c. Also the beautiful white Double Pyrethrum.

When a fair proportion of each is taken the price will be 2*s.* per dozen; but if only Calceolarias and Geraniums are ordered they will be 4*s.* per dozen. Catalogues, in which the above are arranged in sections of colour, &c., sent on receipt of a postage stamp. Parties requiring large quantities can have them in store pots by agreement.

NEW PLANTS.

MESSRS. WILLIAM ROLLISSON AND SONS are now prepared to offer—

BEGONIA SPLENDIDA.—This exquisite plant was discovered in Java by our collector, Mr. John Henshall, during his researches in the Indian Archipelago. It is an extremely beautiful plant of ornamental foliage, the stems and leaves of which are covered over with a bright crimson hirsute down; altogether it presents so striking an appearance, that it is alone much to be desired for its magnificent foliage, for which we are now offering it, the plant not having yet flowered in this country. 42*s.* to 63*s.*

RHODODENDRON GRISEWOODIANUM.—This is a most superb large white free-blooming variety, beautifully tinted with blush, and distinctly spotted with large dark brown spots; fine form and large truss, and possessing beautiful foliage. We have no hesitation in saying that this is one of the finest Rhododendrons ever raised, being perfectly hardy, which has been fully tested during the last two severe winters; for while many of the so-called hardy sorts were completely disfigured in their foliage not a leaf of this variety was injured. 21*s.* to 31*s.* 6*d.*

RHODODENDRON SHAKSPEARE.—A soft rosy purple intensely blotched with orange yellow on the top petals, a most beautiful and thoroughly hardy free late-flowering variety. 21*s.* to 31*s.* 6*d.*

ERICA ÆMULA.—This is a very beautiful hybrid, in the Erica Massoni section, of a fine bright crimson colour, after the style of Erica aristata, but very much higher in colour: altogether this is a very distinct variety. 21*s.*

ERICA EXIMIA SUPERBA.—This variety may really be said to be three times as fine as the parent, whose name it bears; it is a very compact grower and excellent in habit, with tubular blossoms of a fiery scarlet colour. This charming variety obtained the first seedling prize at the Royal Botanic Gardens, 1852. 31*s.* 6*d.*

ERICA PAXTONI.—A very distinct variety obtained by hybridising Erica Hartnelli with Erica Massoni; it blossoms in very large whorls of a soft red colour. This variety will be very useful for Autumnal Exhibition purposes, as it blossoms from July to October. 21*s.*

The set of the above-named Ericas, Three Guineas.

CALCEOLARIA VARIABILIS.—As a bedding plant this will make a charming variety, and in some measure supply the deficiency there has been for durable and effective plants of a light colour for the parterre. It is an excellent grower, of very compact, pretty habit, and produces in great profusion immense trusses of blossom, which open of a delicate primrose colour, and change to white. Altogether it is a most desirable acquisition, and a variety thoroughly distinct from any in cultivation. 10*s.* 6*d.* each.

NEW PRICED CATALOGUE OF PLANTS.

MESSRS. WILLIAM ROLLISSON will be happy to forward this on application. It can also be forwarded throughout the following countries, post free: America, Austria, Belgium, France, Germany, Holland, Prussia, &c. &c. This Catalogue abounds with novelties and rare plants; also contains priced lists of the following:—

	Page
Choice Achimenes	12
„ Alpine Plants	37 to 41
„ Azaleas, Ghent varieties	44
„ indica	23
„ „ species and hybrids	24

New Herbaceous Phloxes	46
Rhododendrons, choice hybrids	47
„ „ Sikkim and Bootan species ...	48
„ „ Conservatory kinds	2 to 4
New Roses	49
Choice Shrubs, &c.	8 to 11
Stove Plants	34
Tree Carnations	9
Tropical Fruits	12
Variegated Foliage Plants	32
New Verbenas	

The following Choice and New Plants can be seen in blossom at the Nurseries:—

AZALEA, EMPRESS EUGENIE.—This magnificent variety received a Bronze Medal, as a new plant, on the 9th inst., at the Royal Botanic Gardens, and will be sent out in the autumn at 21*s.* each. Early orders are respectfully requested, as they will be executed strictly in rotation.

Cattleya ianthina (new).

Odontoglossum hastilabium (rare).

Huntleya cerina.—This received a Silver Medal, as a new plant, on the 9th inst., at the Royal Botanic Gardens; also a First Class Certificate at the Horticultural Society's Rooms, on the 8th inst.

Erica illustris (new); do. affinis (new); do. triumphans.

Rhododendron Edgeworthi (Sikkim).—This received a Silver Medal, as a rare plant, on the 9th inst., at the Royal Botanic Gardens.

Dendrobium clavatum (rare); do Dalhousianum (rare).

Meyenia erecta.—This received a Silver Medal, as a new plant, on the 9th inst., at the Royal Botanic Gardens.

Lælia purpurata (rare).

Cymbidium species.—This received a Silver Medal, as a rare plant, on the 9th inst., at the Royal Botanic Gardens.

The Nurseries, Tooting, London.

NEW PLANTS.

MESSRS. YOUELL AND CO. beg to offer the following:—

Calceolaria EMPEROR NAPOLEON; a Seedling of our own, resembling "Henderson's Model," but larger, brighter coloured, and finer in every respect; of good habit, and one of the very best bedding varieties in cultivation. 7s. 6d. each.

Calceolaria EMPRESS EUGENIE; another of our Seedlings, of a fine golden yellow, the flower stems stout, as they need be, to support the very large trusses of flowers produced by this variety: the habit is robust, flowers large, and well formed. 7s. 6d. each.—The usual discount to the trade.

VERBENA "MRS. FOSTER."

This fine white variety, raised by Mr. EDMONDS, gardener at Scratby Hall, is, we confidently assert, the finest ever offered, and will prove to "White Verbenas" what "Robinson's Defiance" was to the scarlet varieties which preceded it. It was forwarded to the National Floricultural Society, and favourably noticed; but unfortunately the blooms were so much damaged in the transit as to preclude the possibility of its being fully estimated. The habit of the plant is all that can be desired, the heads of flowers (which are produced in profusion) large and flat, the individual flowers round and of good substance, resembling some of those fine Phloxes lately introduced, and of the purest white. Strong plants 5s. each, and one over to the trade when three are taken.

YOUELL & Co., Royal Nursery, Great Yarmouth.

SPLENDID NEW GERANIUM.

DENNIS'S ALMA, the very first in its class. Habit, very robust and bushy, flowering in the same proportion as "Alba multiflora," more early and better for forcing; the flowers are produced in umbels of 6 to 12 on very strong footstalks, which require no artificial support, and the flowers last a considerable time after they are all open. Colour, bright rosy crimson, with large dark spots, and in shape it resembles "Dennis's Perfection." Large strong Plants, just opening their flowers, in 48-inch pots, 10s. to 15s. each; in 4 or 5-inch pots, 5s. to 7s. 6d. A few extra large Plants, 21s. each.

See the remarks on the above Geranium, as exhibited at the Horticultural Society's Meetings, in this Paper, and the "Cottage Gardener" of May 15th. A specimen bloom sent to parties requiring it on receipt of three postage stamps. Post Office orders, on Chelsea, payable to WILLIAM DENNIS, King's Road, Chelsea, London.

ROBERT PARKER begs to inform his friends and the public that his New Spring Catalogue containing Descriptive and Priced Lists of the following:—

Exotic Orchids	Roses in pots [varieties
Ferns—stove, greenhouse, and hardy	Dahlias — show and fancy
Geraniums—show, fancy, scarlet, variegated, and hybrid bedding varieties	Fuchsias
Chrysanthemums—large flowered, and Pompone varieties	Selaginillas or Lycopodiums
Petunias	Gloxinias
Antirrhinums	Cinerarias
	Calceolarias—bedding varieties
	Verbenas
	Miscellaneous bedding plants &c., &c.

Is now ready and can be had Post-free on application.

Paradise Nursery, Hornsey Road, Holloway, London.

ABM. MARTIN AND SON'S LIST OF PLANTS FOR BEDDING PURPOSES; at 3s. and 4s. per dozen; by the hundred 21s.:—

Calceolaria	Senecio	Anagallis
Nierembergias	Cuphea	Salvias
Geraniums, scarlet	Oenothra	Petunias
" other varieties	Dahlias	Chrysanthemums
Fuchsia	Verbenas	Double crimson Rockets, 6s. per doz.
Heliotropes	Gaillardias	Lobellias
Phloxes	Cinerarias	Antirrhinums

Also a Large and Healthy Stock of Azalea indica, Escallonia macrantha, Abelia florabunda, Tropæolum tricolor and Jarrati, Primula sinensis alba pleno, Clematis azurea grandiflora and Sieboldi, Cupressus funebris, Araucaria and Cedar Deodara, from 1 to 5 feet, in pots; Lilium lancifolia, rosea, rubra and alba, Crassulas, Pimeleas, &c., &c., &c. Fuchsias, Geraniums, Hollyhocks, Phloxes and Roses, most of the leading sorts grown. Swede and other Turnip Seeds of the most approved kinds (own growth).—Nursery and Seed Establishment, Cottingham, Hull Branch, Junction Street, ABM. MARTIN & SON, Proprietors.

PAGE AND CO.'s BLIGHT COMPOSITION.—To meet the extraordinary demand PAGE & CO. were compelled to despatch a portion of their Composition in a warm state, which having caused fermentation has nullified its effects! It is particularly requested that all who have procured such from themselves or their agents will allow the quantity to be sent again Gratis, and they have instructed their agents accordingly.

Oxford Street, Southampton, May 26.

PAGE AND CO'S COMPOSITION FOR THE DESTRUCTION OF BLIGHT UPON ROSES, WALL-FRUIT TREES, CUCUMBERS, MELONS, VINES, STOVE AND GREENHOUSE PLANTS.—Extra Strong, 4s. per gallon, sufficient to make four (Jars and Barrels extra). Directions for use forwarded. Ten gallons and upwards carriage free to London.

After four years' extensive use by the most eminent Gardeners in the kingdom, the superiority of PAGE & CO.'S BLIGHT COMPOSITION is unquestionable, requiring only a trial to insure its general use for destroying every pest to which Plant and Fruit Growers are subject (without injuring the most delicate flowers or foliage) and promoting a luxuriant growth.

See two pages Testimonials, *Gardeners' Chronicle*, March 3, 1855.

CHOICE CINERARIA SEED.

LUCOMBE, PINCE, AND CO. have now ready for sending out Seeds of their very superior CINERARIAS, which have been saved with great care from the finest varieties. The great satisfaction which their Cinerarias have given for several successive years, enables them to recommend their Seed of the present season with much confidence. Packets sealed and warranted by them at 2s. 6d., free by post.

Exeter Nursery, Exeter.—Established 1720.

THE PAMPAS GRASS "CYNERIUM ARGENTEUM."

LUCOMBE, PINCE, AND CO. have a fine healthy stock of this highly Ornamental Plant, well established in pots, and fit to send out immediately. It is universally admitted that few plants produce a more beautiful effect than this gigantic Grass. See Woodcut and description of it in the *Gardeners' Chronicle* of November 4th, 1854. Sizes, prices, and all particulars may be had on application to LUCOMBE, PINCE, & Co., Exeter Nursery, Exeter.—Established 1720.

ITALIAN RYE-GRASS SEED.

SUTTON AND SONS, Reading, having in anticipation of the present great demand for this invaluable article provided an extra large stock of the best quality seed, are still able to execute orders for either Sutton's Improved, Dickenson's, or Fresh Imported Seed, price 7s. 6d. per bushel. Instructions for cultivation are sent with the Seed.—Early orders will be necessary.

SUTTON'S GRASS SEEDS.—

EXTRACT OF A LETTER FROM DR. LINDLEY:—

"Messrs. SUTTON,—*We have already made trial of your Lawn Grass Seeds, and it is but justice to say they have proved the best we have sown for many years.*

(Signed) "JOHN LINDLEY.

"*Horticultural Society, 21, Regent Street, London, Nov. 9, 1853.*"

Messrs. SUTTON are continually receiving similar letters of commendation of their Lawn Grass Seeds. Price of seed, 1s. 3d. per lb., 3s. per gallon, or 21s. per bushel, CARRIAGE FREE, except very small quantities. The quantity required is 40 lbs. per acre, for forming new lawns, or from 10 to 20 lbs. per acre for improving old lawns.

SUTTON'S GRASS SEEDS *for forming Permanent Pasture, 24s. to 30s. per acre;* SUTTON'S RENOVATING MIXTURE *for Improving Old Pastures, 9d. per lb.*

JOHN SUTTON & SONS, Seed Growers, Reading, Berks.

N.B. No Agents appointed.

CARNATIONS AND PICOTEES.

MESSRS. YOUELL AND CO. beg to offer to the admirers of these elegant flowers a quantity in pots, part of the stock originally intended for their own blooming, at 21s. per dozen pairs.

They are fine strong plants, and may be either turned out into the borders immediately, or repotted without suffering the least check, a manifest advantage at this season.

Royal Nursery, Great Yarmouth.

The Gardeners' Chronicle.

SATURDAY, MAY 26, 1855.

MEETINGS FOR THE ENSUING WEEK.

SATURDAY, June 2—Crystal Palace Horticultural Fête.

The GRITTINESS OF PEARS is the chief circumstance which diminishes their value at the dessert. Some are more subject to the affection than others; but all are occasionally deteriorated by it. The proximate cause is known to consist in the deposit of hard matter in certain cells of the flesh, analogous in all respects to that which gives its bony texture to the stone of Plums, Cherries, &c. In all these cases the tissue is originally soft and pulpy, and if it were to remain so the whole of a Plum would be as perfectly eatable as a berry of the Grape. But in stone fruits gritty matter is gradually deposited within the pulpy cells of the lining of the flesh, as constantly and naturally as phosphate of lime in the gelatinous tissue of the bones of animals. In the Pear, on the contrary, there is no special part set aside for the reception of the grit, which manifests itself accidentally here and there among the soft flesh, sometimes in large sometimes in small quantities. In fact, in the Pear the grittiness may be regarded as an unnatural secretion, induced by unknown causes, while in stone fruits it is part and parcel of their nature.

We say induced by unknown causes, for we are not aware that any attempt has been made to show out of what circumstances the grittiness arises, or by what it is diminished or prevented. We are now, however, assured that it is entirely owing to the exposure of the Pear fruit to too much cold. It appears that on the 16th of last November, Mr. A. DELAVILLE, gardener at the Château de Fitz-James, near Clermont (Oise), exhibited before the Imperial Horticultural Society of Paris some St. Germain Pears, a part of which were covered with spots and full of grittiness, while the others were remarkable for their beauty, and wholly exempt from grittiness. We are assured that both samples came from the same tree, and that the only difference consisted in the fine ones having been protected, while the others had been exposed to the weather without any shelter. In fact, Mr. DELAVILLE is of opinion that the external spots and the internal grittiness were wholly caused by the cold rain which had fallen on the fruit during its growth, and had arrested the free circulation of sap.

With reference to this hypothesis, he remarks that the sorts which are most subject to spotting (*tavelage*) and grittiness are those which have the finest skin, such as the St. Germain, Crasanne, Brown Beurré, and Winter Bonchretien. The effect of aspect also supports this view, it being notorious that the affections in question are most common with Pears on open standards or exposed to the east and south, the quarters whence (at Clermont) the coldest rains always come.

The manner in which M. DELAVILLE protects his Pears is thus described:—As soon as the fruit is completely set he encloses every cluster in a cornet of paper, fixed to the top of the stalk by a piece of rush (bast). This cornet must be large enough to cover all the upper part, so as to guard the fruit perfectly from the direct action of exterior agencies. If a tree is trained to a wall the same degree of protection is not necessary, because the wall affords a natural shelter on one side, but where pyramid or other openly trained trees have to be dealt with the cornet must be very wide, and the small end placed upwards, so as to leave nothing uncovered except the bottom of the fruit stalk.

These cornets remain in their places during the whole season, and are not disturbed till about a fortnight before gathering, at which time they are removed, in order to give the fruit colour and to complete the ripening, "just as Peaches and Grapes are unleafed a short time before gathering them." M. DELAVILLE concludes by assuring the public that by this simple method his whole crop of Pears is very fine, instead of a third or more being unmarketable, as is often the case.

The effect of these precautions should certainly be tried here, now that Pears are getting into the condition when paper cornets are first applied.

THE Honorary Secretary of the Torbay Horticultural Society has invented a very useful instrument for gardeners, which he calls a SELF-REGISTERING HYGROMETER.

It is needless to say that the hygrometrical condition of the air is as important to the horticulturist as the thermometrical; and it is desirable that the instruments used in determining either humidity or temperature should be self-registering, in order that we may ascertain their condition, not only at the moment of observation, but also their fluctuations during any preceding period.

Self-registering thermometers have long been in general use, with the most beneficial results, but no self-registering hygrometer has hitherto been constructed, and those which have been adopted for time observations have either been very imperfect, or not sufficiently simple and inexpensive for horticultural purposes.

The new instrument which Mr. VIVIAN submitted on the 8th inst. to the Horticultural Society, and from whose report this account is chiefly taken, is a combination of LESLIE'S wet-and-dry-bulb hygrometer and the differential thermometer, with steel indexes, which may be adjusted either by gravitation or the magnet. The degree indicated by the spirit or index in the tubes is the amount of difference between the temperature of the air and evaporation; when it stands at zero (0) the air is completely saturated, and the *sensible* humidity of the air becomes less as this difference increases. Thus, observes Mr. VIVIAN, in an Orchid house the instruments should never register more than 1° or 2°, whilst Ericas will require 8° or 10°.

For meteorological purposes the *actual* humidity may be readily ascertained from Mr. GLAISHER'S tables, or the dew point may be approximately deduced by doubling the amount of difference between the wet and dry bulb. For instance, if the reading of the hygrometer is 5°, whilst the thermometer is 50°, the dew point will be 45°, below which fog, rain, or the precipitation of dew will occur.

As a weather-glass the instrument promises to be also very useful, as without a knowledge of the hygometrical condition of the atmosphere the barometer is of little service.

The instrument, as exhibited by Mr. VIVIAN, although imperfectly and hastily constructed, appeared highly deserving of especial notice, and received an honourable mention, as it well deserved; for hitherto, we believe, there has been no instrument for registering the extremes of dryness or moisture—a point of the utmost importance in exotic culture.

We understand that perfect instruments are nearly ready for sale, and we fully anticipate their being soon regarded as not less essential in gardens than the thermometer itself. No care being required in their use, nor any quick and dexterous observation, the indications of Mr. VIVIAN'S hygrometer may be read off with as much facility as those of the thermometer itself, which is a point greatly in its favour.

In Dr. SCHMITZ'S admirable translation of NIEBUHR'S "Lectures on Ancient History," occurs the following passage (vol. 1, p. 16): "Man was first created at Babylon: *corn there grew wild*, and the new race of beings there found the first necessary

food, especially Wheat. This tradition is the more remarkable because several naturalists have made the observation that corn does not grow wild in any part of the world. I do not know whether by a process of improvement our garden fruits can be derived from wild fruit; *it is well known, however, that the noble Vine Grapes grow wild in Colchis.* Whence, then, does corn come? My opinion is that God made direct provision for man; something was given to all, real Wheat to the Asiatics, and Maize to the Americans."

Can any scholar among our readers throw light upon the sentences printed in italics? They well deserve a commentary.

New Plants.

126. Zebrina pendula. *Decaisne in Revue Horticole, 4 ser., vol. 4, p. 141, t. 8.*

This is the common trailing Tradescantia-like plant so much cultivated in our greenhouses for the sake of its foliage, stained with purple beneath and striped with broad bands of white on the upper side. It was described in the *Journal of the Horticultural Society* in 1850, under the name of *Cyanotis vittata*, from which genus we see no sufficient reason for excluding it.

127. Taxus adpressa. *Carrière in Revue Horticole, ser. 4, vol. 18, p. 96, i.e. aliàs* Cephalotaxus adpressa *of Gardens.*

M. Carrière has shown that this beautiful hardy plant is a true Yew, and by no means a Cephalotaxus, as has been supposed. It has long been known that the species before us will not stand when worked upon the latter genus, although it does perfectly well on the common Yew, and it now appears that its fruit is precisely that of a Taxus.

VEGETABLE PATHOLOGY.—No. LXXIII.

316. Chlorosis 7. (*Accidental and Functional.*) Yellowness.—The form of Chlorosis which now comes under consideration is that to which the name of Icterus has been given by some authors, from the dull yellow green which is assumed by a large portion of the plant. It arises from various causes, or rather from conditions unfavourable to health, as from stagnant water, depressed temperature, especially when accompanied by deficiency of light, from deficiency of light itself, or from want of proper nutritious matter in the soil. The vital powers of the plant are depressed, but more especially those of the particular parts affected, insomuch that more favourable circumstances seldom produce a more healthy tint in the older plants, but only enable the plant to produce more healthy organs, by which the general end for which it is cultivated may be at length effected. Where there is mere absence of colour, as in bleaching, without any derangement of general health, exposure to light, if it be not too abrupt or accompanied by unfavourable conditions of dryness, whether of the soil or surrounding air, will soon remedy the evil, but in Chlorosis the tissues of the organs already formed are so affected that they are seldom in a condition to assume fresh energy. One of the most familiar examples is that of yellowness in Wheat crops, which in some seasons is so prevalent, and unless it be alleviated in good time is so prejudicial to the general produce. Other things being equal, want of strength in the soil, whether original or from defect of manure, is a most important circumstance in connection with the disease. A season like the present, of unusual cold and dryness, has afforded many opportunities of examining the circumstances under which the plant has suffered most, and it has been impossible to glance over two or three contiguous crops without observing that its intensity is in direct proportion to the natural deficiency of the soil or the negligence of the cultivator.* In wet seasons, accompanied by a constant prevalence of north-east winds, the effect is still more striking and more universal. In every case the only hope of a good harvest depends upon an amendment of the conditions which have induced the malady. If the soil is really in good heart, warm showers or an increase of temperature will ultimately remedy the evil, but if the sickly tint has arisen from poverty of soil, it can scarcely be expected that better weather will entirely mend the evil. In such cases the only practicable remedy is to apply some top-dressing, as soot or pigeon-dung properly mixed, which may be rapidly absorbed by the foliage itself or by the roots. Even where the plant has grown well at first and looked healthy, in consequence of no unfavourable conditions of climate, if the staple of the land is not good or there has been a deficiency of proper manure, the crop is sure to fall off just before the flower stem is produced, even under the most favourable external conditions.

317. Where plants are cultivated in pots it is often very difficult to secure a proper drainage, and much more frequently no due attention is paid to the subject. The surface of the soil, too, becomes compressed, so that the air does not penetrate into the pores, its original texture is not good, or algæ grow upon the surface, which are inconsistent with health; where the pots are very bibulous, evaporation is going on rapidly from the surface of the pot, and the temperature in consequence of that part which is in contact with the most active roots is depressed, where the pot is not sunk into the soil. Under such conditions many plants, as Calceolarias, Pelargoniums, Fuchsias, &c., are very apt to acquire a yellow hue, which is sometimes very difficult to remedy, and which renders such plants very unfit for propagation. The first point towards their recovery is to repot them with greater care as regards drainage and the texture of the soil; and if there is reason to believe that the evil has at all arisen from poverty, guano can be administered cautiously, or a little old and very rotted cow-dung may be mixed with the soil. The very best effect is also produced in some cases by the insertion of two or three small crystals of sulphate of iron in the soil, which gradually dissolve, and act probably as a tonic. Fuchsias which were apparently past all hope of recovery will sometimes revive rapidly under this treatment. *M. J. B.*

* Close to the place where I am writing are three contiguous fields, the first of which has not been fallowed for nine years, nor was the ground manured for Wheat; the second of inferior staple, with a Wheat crop following Oats; the third of much the same quality as the second, but manured with the refuse of skins used by hat-makers, with an intermediate patch under common cultivation. The difference is very striking. The manured crop is most luxuriant, the unfallowed land of rich staple covered with an excellent plant of a very healthy aspect: the patch under ordinary cultivation is yellow, and that succeeding Oats on poor land extremely yellow with little hope of recovery.

BEDDING PLANTS AND BOTTOM-HEAT.

The remark recently made by the writer of the Calendar relative to the propriety of planting out strong plants in June rather than weak plants in May is very judicious in a season like the present, when the ground temperature is excessively low, and when, too, in many instances from the losses of the winter, plants are not so strong as they are wont to be in more favourable seasons. I have frequently, both privately and publicly, pointed out the impropriety of early planting, that is before the 20th of May, and, except in very rare situations and in the case of unusually forward springs, I am quite convinced that there is not a day gained by planting before the first week in June. I have had several thousands of Geraniums and other plants bedded out since the middle of April, but they are standing on sheltered south and west borders, and have been nightly, and sometimes during the day too, covered with Spruce branches and mats, to protect them from the severity of the weather. These plants look well, are making root, have healthy green foliage, and have quite recovered the check they experienced at the time of putting out; but had they been planted in the flower garden at the same time, their safe protection would have been far more difficult, and the nuisance of the protecting material in a dressed garden quite intolerable. The advantages of this system of bedding out all established plants are very great; for you not only get a plant with an improved constitution, but one-third of the pots necessary under other circumstances will be found quite sufficient. The trouble of planting and transplanting will of course be urged as an argument against the plan by the advocates of the old system; and though I admit there is a good bit of trouble and time occupied, the saving in watering more than counterbalances it, while the rapid progress the plants make is another decided advantage. Cold as the weather has been, these plants I find are making root into an inch or two of leafy dung which was placed under them, and I have no doubt that they will remove to the flower-beds almost without sustaining any check, and will be in bloom in a week or two without presenting any of that rusty appearance so general in newly-planted things.

But independently of the risk we run in planting out before we have settled mild-growing weather, it is also of great import in a season like the present, that the ground should attain its natural heat before tender plants are committed to its fostering care. A week or two back we were told that Nettle seed would not vegetate at the same temperature as Groundsel, and that the generality of exotic seeds would not vegetate in a temperature below 46°. I have just been testing the temperature of the soil in the flower garden here, and I find it range from 44° to 46° at from 9 to 12 inches deep, according to the exposure and the time the beds were last digged, the highest temperature, that of 46°, only being found in a bed that was dug on a sunny day a fortnight back. Now, the mean temperature of the earth at 1 foot deep, as explained by an important table in Dr. Lindley's "Theory of Horticulture," just published, is April 46°, May 53°, and June 60°. The lowest temperature for May was in 1845, viz., 50°, the highest for the same month in 1848 56°; the lowest temperature for June is 56° in 1852, the highest 64° in 1846. Thus it will be seen that the ground at the present time is 4° colder than it has been known since 1844, and 10° below the highest temperature during the same period. Need we then be surprised if plants make slow progress? It is physically impossible that they could do otherwise until the earth attains something like its natural temperature, and the more plants are watered under such circumstances, except with water very considerably warmer than the soil in which they are growing, the greater the injury they must receive. To drench plants with cold water at the present time is labour worse than lost. But what is to be done? To plant even now until the earth has attained a temperature of 55° will not be a wise proceeding, yet plant we must. Fifteen years back, in my treatise on Cucumbers in pots, I recommended the "digging in" of solar heat for ridge Cucumbers, and I should now advise the same process to be observed with all flower-beds that are not stocked with plants. By forking the beds over after 4 o'clock every sunny afternoon for a few days, making or raking the surface of the ground tolerably fine, its temperature may be raised from 6° to 10° in a very short time, and it is I think quite unnecessary for me to explain that an increase of bottom-heat at the time of planting to that amount is a matter of much greater importance than hurrying the roots of plants into the ground the first fine day, just because the sun is shining or the air overhead is a little genial. What I am recommending is just what I have practised for many years, and if those who do not happen to think on this matter as I do will please to make the experiment, I know they will be satisfied with the result. Let them get heat into the soil, then plant and give a sufficient watering with warm water, and when it has soaked in leave the surface of the soil loose, fine, and smooth, and little after-watering, unless the weather is very dry, will be found necessary. Daily dribblings of water may be all very well to occupy the leisure hours of amateurs "who have nothing else to do;" but gardeners, and those under them, may spend their time far more profitably. *W. P. Ayres, Whittlebury Lodge, May 22.*

DOES SEA-WATER KILL SEEDS?

As you have done me the honour to notice favourably my wish to ascertain experimentally the power of resistance in seeds to the injurious action of sea-water, you may perhaps like to have a report. As such experiments might naturally appear childish to many, I may be permitted to premise that they have a direct bearing on a very interesting problem, which has lately, especially in America, attracted much attention, namely, whether the same organic being has been created at one point or on several on the face of our globe. As geologist I feel a special interest on the possibility of plants being transported by sea to distant islands, owing to the great influence which it is very obvious the views of the late ever-lamented Edward Forbes have had on the subsequent writings of botanists and zoologists. Forbes, as is well known, boldly supposed that the north coast of Spain had formerly been directly continuous with Ireland, and he extended the continent of Europe as far as and beyond the Azores. To imagine such enormous geological changes within the period of the existence of now living beings, on no other ground but to account for their distribution, seems to me, in our present state of ignorance on the means of transportal, an almost retrograde step in science—it cuts the knot instead of untying it. Weighty objections might, I think, be urged against Forbes' hypothesis as applied in the above and many other cases, but this is not the proper place to discuss such a question. As I had not the least notion when I began, whether or not the seeds would be all killed by a single week's immersion, I at first took only a few, selecting them almost by chance from the different great natural families; but I am now trying a set chosen on philosophical principles by the kindness of Dr. Hooker.

The sea-water has been made artificially with salt procured from Mr. Bolton, 146, Holborn Bars, which has been tested by better chemists than men, namely, by numerous sea animals and algæ having lived in it for more than a year. The seeds were placed in separate bottles, holding from 2 to 4 oz. each, out of doors in the shade: the mean temperature has during the period been about 44°, rising during one week to a mean of nearly 48°. Most of the seeds swelled in the water, and some of them slightly coloured it, and each kind gave to it its own peculiar and strong odour. The water in which the Cabbage and Radish seeds were placed became putrid, and smelt offensively in a quite extraordinary degree; and it is surprising that any seeds, as was the case with the Radish, could have resisted so contaminating an influence; as the water became putrid before I had thought of this contingency, it was not, and has never been, renewed. I also placed seeds in a quart bottle in a tank filled with snow and water, to ascertain whether the seeds kept at the temperature of 32° would better resist the salt water; this water, like that in the small bottles, to my surprise became turbid and smelt rather offensively. In the following list I have no reason to suppose, except in the cases where so stated, that the seeds have endured their full time.

(1) Seeds of common Cress (Lepidium sativum) have germinated well after 42 days' immersion; they give out a surprising quantity of slime so as to cohere in a mass. (2) Radishes have germinated less well after the same period. (3) Cabbage seed: after 14 days' immersion only one seed out of many came up; I think this is rather strange considering that the Cabbage is a sea-side plant; in the ice-cold salt water, however, several have come up after 30 days' immersion. (4) Lettuce seed has grown well after 42 days; (5) of Onion seed only a few have germinated after the same period; (6) Carrot and (7) Celery seed well after the 42 days; (8) Borago officinalis, (9) Capsicum, (10) Cucurbita ovifera, have germinated well after 28 days' immersion; the two latter, rather tender kinds, were also tried in the ice-cold water, and have germinated after 30 days' immersion. (11) Savory, or Satureja, has grown somewhat less well after 28 days. (12) Linum usitatissimum: only one seed out of a mass of seeds (which gave out much slime) came up after the 28 days, and the same thing happened after 14 days; and only three seeds came up after the first seven days' immersion, yet the seed was very good. (13) Rhubarb, (14) Beet, (15) Oracle, or Atriplex, (16) Oats, (17) Barley, (18) Phalaris canariensis, have all germinated excellently after 28 days; likewise these six latter after 30 days in the ice-cold water. (19) Beans and (20) Furze, or Ulex: of these a few survived with difficulty 14 days; the Beans were all killed by 30 days in the ice-cold water. (21) Peas germinated after seven

days, but were all dead after 14 days' immersion out of doors, and likewise after 30 days in the ice-cold water. (22) Trifolium incarnatum is the only plant of which every seed has been killed by seven days' immersion; nor did it withstand 30 days in the ice-cold salt water. (23) Kidney Beans have been tried only in the latter water, and all were dead after the 30 days.

As out of these 23 kinds of seed, selected almost at hap-hazard, the five Leguminosæ alone have as yet been killed (with the exception of the Cabbage seed, and these have survived in the ice-cold water), one is tempted to infer that the seeds of this family must generally withstand salt water much worse than the seeds of the other great natural families; yet from remarks in botanical works, I had expected that these would have survived longest. It has been really curious to observe how uniform, even to a day, the germination has been in almost every kind of seed, when taken week after week out of the salt water, and likewise when compared with the same seeds not salted—all of course having been grown under the same circumstances, namely, in glasses on my chimney-piece, so that the seeds from the day of being planted have been always under my eye. The germination of the Rhubarb and Celery alone has been in a marked degree altered, having been accelerated. With respect to Convolvulus tricolor, not included in the above list, I may mention that many of the seeds germinated and came out of their husks, whilst still in the salt water, after six or seven days' immersion.

To return to the subject of transportal, I may state that in "Johnston's Physical Atlas" the rates of 10 distinct currents in the Atlantic (excluding drift currents) are given, and the average of them is 33 nautical miles per diem; hence in 42 days, which length of immersion seven out of the eight kinds of seed as yet tested have already stood, a seed might be readily carried between 1300 and 1400 miles.

I will conclude this too lengthy communication by observing that all the 40—50 seeds which I have as yet tried sink in sea-water: this seems at first a fatal obstacle to the dissemination of plants by sea currents; but it may be doubted whether most seeds (with the exception of the winged kinds), when once shed, are so likely to get washed into the sea as are whole or nearly whole plants with their fruit by being carried down rivers during floods, by water-spouts, whirlwinds, slips of river-cliffs, &c., continued during the long lapse of geologically modern ages. It should be borne in mind how beautifully pods, capsules, &c., and even the fully expanded heads of the Compositæ close when wetted, as if for the very purpose of carrying the seed safe to land. When landed high up by the tides and waves, and perhaps driven a little inland by the first inshore gale, the pods, &c., will dry, and opening will shed their seed; and these will then be ready for all the many means of dispersal by which Nature sows her broad fields, and which have excited the admiration of every observer. But when the seed is sown in its new home then, as I believe, comes the ordeal; will the old occupants in the great struggle for life allow the new and solitary immigrant room and sustenance? *Charles Darwin, Down, Farnborough, Kent, May* 21.

COMMON THINGS.

Preparing Scarlet Geraniums for Bedding. — The season has been so peculiar that the usual routine system of treating bedding plants has been completely upset. Few things have yet been planted out, and therefore considerable care has been required to keep them so long in a thriving state. To give Scarlet Geraniums intended for beds artificial heat after they have been struck and potted off, as is often done, would not answer this year; that would very much frustrate the end every good cultivator ought to have in view, viz., plants sufficiently healthy and hardy to profit by the naturally increasing warmth of the weather at planting out time, instead of, as is too frequently the case, receiving a check from which it takes them a long time to recover. If the plants are kept cool and properly hardened off by exposure to sun and air during the spring months whenever the weather will permit they will show more flowers in proportion to the size of the plants in June than similar ones which had been subjected to heat would in July. The same remarks are applicable to all other kinds of plants kept over winter for bedding purposes. In short artificial heat is unnecessary, even although the plants had been kept in the cutting pots during winter and required shifting in the spring; this can be easily accomplished without forcing them to make premature growths, which never get hardened before planting time. Too much shade, after they are kept in temporary quarters out of doors where accommodation is limited, also aggravates the evil. The result in both cases is that the plants shed their foliage, and for a long time look shabby.

Scillas.—These should be as common as Snowdrops and Crocuses in every garden where early spring flowers are sought for. They have many recommendations. Growing but a few inches high, and bearing for the most part blue flowers, they form beautiful beds, or margins to beds, in situations where now such plants as Crocuses and Snowdrops are almost exclusively depended on for the earliest bloom. The Snowdrop, as is well known, furnishes white blossoms only, and the Crocus supplies various tints of orange, white, yellow, and purple; but in neither is the pure blue colour to be found. Those, therefore, who desire to render their gardens ornamental at the earliest dawn of spring, should procure and plant Scillas largely; there are several kinds adapted for that purpose. S. bifolia grows about 3 or 4 inches high, and when growing freely, throws up several flower spikes, each of which bears from four to eight blue flowers, during April and May. S. verna grows about the same size, and bears a roundish head of purplish blue flowers, in May and June. S. amœna is also about the same stature, and produces largish drooping light blue flowers, in April and May. S. sibirica, another of these dwarf species, has drooping blossoms, of a beautiful clear light blue, which are borne in April. Of S. bifolia there are at least two very distinct varieties, one having white and another blue blossoms. They are easily cultivated.

CHINESE FLOWER POTS.

We have certainly made wonderful progress in plant culture during these last 25 years, and this may have induced us to cling so stoutly as we have done to the old stereotyped form of flower-pot; another reason why we have confined ourselves so much to that kind of pot may be the great convenience it affords in shifting plants from small pots into larger ones, and also the facility it furnishes of examining at any time the state of the roots. Besides there may be another reason, the most potent of all, for using almost exclusively our common form of flower pots, and that is their inexpensiveness. For some purposes, however, they may with advantage be dispensed with; *cultivate* plants in them if you please, but keep them out of the drawing-room, where they are anything but models of taste, and take a lesson from the Chinese. In the accompanying sketch you have a perspective drawing of a common Chinese garden flower-pot, which was sent me by Mr. Fortune embedded in the soil of a Wardian case, having some seeds sown in it. When cleaned it appeared to me to be very superior to our common pots. It is very smooth on the surface, and the colour that of a cake of Indian red paint. The ornaments are white and very agreeably relieve the tone of the Indian red; in fact, in point of form and finish it is an exceedingly tasteful article and fit for any drawing-room window. I am aware that attempts have been made to improve our common garden pots, but the forms hitherto recommended, and the offensive colour of the clay of which they were manufactured, rendered them anything but drawing-room ornaments. If something more classical and artistic in design were invented worthy of a place in a lady's sitting room, we should soon see the ugly green baskets with their covering of yellow sickly moss now employed vanish. Besides such huddling of plants together and smothering them in sphagnum is altogether as unnatural as it is at variance with good taste. *R. Glendinning.*

Home Correspondence.

Annuals.—A few words respecting this useful class of flowers may probably not be out of place, as I am of opinion that they are not encouraged as their merits deserve, chiefly perhaps from the almost general impression that their blossoms are but short lived. It cannot be denied that such is often the case, but I wish it to be known that this is owing more to mismanagement than to the real deficiencies of the plants. Some of them may be noticed in the parterres of our nobles, in the small gardens of the citizen amateur, and in the borders surrounding the humble cottage; but owing to carelessness or injudicious management they are rendered of ephemeral duration, although many of them have good recommendations, such as colour, habit, and profusion of bloom. The Zinnias even dazzle the eyes when looking on them beneath a hot summer's sun; the glittering Portulaccas, the dwarf and lovely Mesembryanthemum bicolor, the nice Calandrinia splendens, the beautifully veined Salpiglossis, the rich dark and light blue of Eutoca viscida, and Nemophila insignis, the splendid Platystemon californicum, Phlox Drummondi, Campanulas, Stocks, Lobelias, Gilias, Asters, Indian Pinks, and a great quantity of others, arise in my memory and claim a notice, but particularly the truly handsome Sphenogyne speciosa. When well managed, a bed of this plant cannot be equalled for the richness of its peculiar colour—viz., orange yellow, with a dark eye, each flower being larger than a half-crown piece. Annuals are too often sown so thickly in the open border that the plants choke each other in growing, and are starved into a premature maturity. In this case the real resources of the plants are not developed, and premature decay is the natural result; the blossoms are no sooner partially produced than their career is run. The duration of some annuals, I must acknowledge, is brief, and to have a summer's display constant forethought must be exercised to keep up a succession, but still they are capable of a much greater degree of usefulness than they in general afford; many of them being of easy culture and soon out of bloom, we are careless in recognising the fact that they demand attention to induce them to fully develope their beauties. It often happens that annuals sown early under the protection of frames are kept too warm and thereby rendered weakly, and they are mostly too thick and in small pots; those placed in the borders or beds are either sown and left to grow without attention, or are transplanted from the frames in weak tangled masses, unable to struggle successfully with their change of circumstances, which renders their brief duration a great deal more limited. As a general rule, annuals should be treated as individual plants, at least this course should be adopted in the early stages of their growth; the greater length of time they flower, size of their blooms, strong and healthy habit are the best recommendations I can offer in favour of such a system. For some of the later annuals a good plan is to sow their seeds in some convenient situation, in a light shallow soil, well incorporated with fine leaf mould in order to induce an abundance of fibres. It is well to render the natural surface perfectly solid, and add artificially all the soil required. As soon as the plants are of sufficient size, they should be transplanted into a situation similarly prepared to that where the seeds were sown, and at sufficient distances from each other, to allow their removal with as little mutilation of the roots as possible. If a constant succession of plants is provided in this way they can be moved at any time in the summer months, and often without a leaf flagging. As a matter of course a cloudy day is desirable for the operation, but if they are grown as I have suggested, bright weather need be no obstacle to their removal. Leaf-mould is the best soil for growing them in until their final removal, as the fibres ramify so thickly in the decaying leaves, that in the process of shifting to their final destination little or no damage is sustained, and where a few beds or vacancies in the borders have to be filled up, a couple of young men with trowels and hand-barrow will soon accomplish the desired effect. Annuals that are required to remain as long a period as possible in bloom should never be allowed to perfect seeds; it should be remembered, as a physiological fact closely bearing upon practical gardening, that the great end of all organic life is to perpetuate its kind, and that by taking advantage of this principle and retarding such a consummation, a more protracted existence can be procured. By this practice plants naturally annuals are often rendered perennials. *John McArdell, late Gr. to H. Sharples, Esq.*

The Vinegar Plant (see p. 336.)—If your correspondent will try the undermentioned receipt he will find it answer. To three-quarters of a pound of coarse sugar add half a pound of treacle; put them into a stone or glass pot that will hold about two gallons, and is about 1 foot in diameter; its mouth should not be less than 8 inches in diameter with a rim, for the convenience of tying down. Having prepared the above, pour one gallon of boiling water on the sugar and treacle; stir well to dissolve them, and when cooled down to about blood-heat add your plant, keeping the part that was separated from the parent uppermost. Then get a piece

of strong brown paper, place it over the jar and tie it down in the manner in which preserves, &c., are done; do not perforate the paper, but rather make it air-tight. This done remove the pot to a place whose temperature varies from 50° to 70°. If all goes on well the liquor will become good vinegar in eight or ten weeks. Your correspondent may keep the young plants in a plate with a little vinegar for several days before it will begin to decompose. I do not recommend disturbing it often when in the liquor. *Edward Morse.*——I have used no other vinegar than that of my own making for these last two years. On half a pound of treacle and a quarter of a pound of sugar-foots I pour five pints of boiling water. I mix them well, and when lukewarm put in the plant. I use a soup tureen and find the cover to admit air sufficient (the quality might be better for standing three months, but the quantity would be less). After seven weeks I strain the vinegar, bottle it, and in about three days cork it up, and it is fit for use. The plant will be fit for use after laying out for a fortnight: how much longer time it might bear I cannot say. If the new plant (which is generally formed in the seven weeks) is very thin I use the old one as well. *S. B., the Lodge, Watford House, Watford, Herts.*

Hint to Naturalists.—At Ischia, Capri, and other lofty islands on the coast of Naples, quantities of birds are caught in April, often very rare species, and exposed for sale at Naples. At Ischia you find the traps by hundreds up at the top of the mountain, 2500 feet, at Capri 1900; many are knocked over by stones, either they are stupid or tired out. On coming to Marseilles in a steamer, the day wet and calm, the swallows settled on the bulwarks and boats of the steamer, and were so tired or tame that I caught in my hand three or four, and a sailor caught two in each hand. Some finches were more shy, but kept flying round and pitching on out-of-the-way parts of the vessel; one seemed like a small bright yellow-hammer or canary. This happened opposite Hyeres on the 30th April; we had nearly 100 souls on board, and not far from land, from about 7 o'clock, a.m., for several hours. *Somerset.*

Roots on the Stems of Vines.—I have been induced to offer the following facts relative to this subject from having been repeatedly asked the cause of roots appearing on the stems of Vines. The importance of bottom heat to the roots of Vines is now all but universally acknowledged. Were it generally applied, roots on stems would disappear. Of this I had what I consider satisfactory proof during the past season. Three Vineries under my care seemed to be equally affected with these unsightly appendages. During winter, when the pruning was performed, these roots were all removed, being then in a dead state. On the border of the earliest house a quantity of fermenting material was placed, which raised the temperature of the surface of the border to 100°, and even some inches below the surface it was at that temperature. Operations in the interior of the house were conducted very gradually—the Vines broke well, matured a good crop of fruit—the berries were particularly large, and generally well coloured. In this house no roots appeared on the stems of the Vines. The Vines in the other houses subject to precisely the same treatment, with the exception of having no fermenting material on the borders over their roots, had, as usual, their stems covered with a profusion of roots; hence I conclude that the cause of roots on the stems of Vines is due to the inactive state of the roots in the borders, owing to an insufficiency of heat there, while the stems in the interior of the house are being subject to a high moisture temperature. In short, these stem roots are the result of an effort on the part of the Vine to draw supplies from the moisture of the house for the support of the young branches and leaves, the natural roots being too cold a medium to furnish the demands made upon them. I may further state that, although the temperature of the border in the foregoing instance was raised to 100°, yet I do not consider this by any means necessary; 70° will be found ample; 100°, however, do not seem to have any injurious effects upon the roots of Vines, and I have been told of an instance in which the temperature was raised to 116°, and yet no injury followed. *Robert Grey, Hadzor Gardens, Droitwich.*

Libocedrus decurrens.—I inclose you two plants of this Libocedrus which have come in twins. We have observed several cases this year of the same sort, but only among the seedlings of this plant, and what has been named Pinus Beardsleyi. I have never before seen this happen, though I have looked for it. The seeds were brought to this country by William Murray, Esq., and they are now being grown in Messrs. Lawson's nursery here. *P. S. Robertson, Bangholm Nursery, Edinburgh.* [We are not acquainted with any similar case. The specimens were united for the greater part of the length of the first joint of the young stem below the cotyledons.]

Result of not Protecting Apricots.—I have given my Apricots no protection either this season or last. The Moor Parks were a famous crop last year, and they are equally good now, not having been damaged in the least by spring frosts. In the spring of 1853 I covered them with double mats, but had an indifferent crop. *J. Stevens, Malvern Hall, Solihull.*

The Spring in Dorset.—The late rains have revived a number of plants that were, to all appearance, dead last week, such as Azaras, Lagerstrœmia, Lonicera japonica, the New Zealand evergreen Clematis, &c. Ilex Cunninghami and dipyrena seem perfectly hardy, more so than the American Hollies; and Laurus glauca (against a wall) is perfectly untouched; these are great acquisitions. Your Berberis coriaria is covered with blossom, while tinctoria seems killed. Rhododendrons, Camellias, Azaleas, and all hardy bulbous plants, are flowering more luxuriantly than I ever saw them. Beschorneria yuccoides is again throwing up a handsome scarlet spike and bracts. *S.*

Forcing of Small Fruits.—Gardeners whose employers are fond of high-flavoured fruits will do well to cultivate the Hautbois Strawberry largely for forcing. I find it most excellent. The small fruits, as Raspberries, Currants, and Gooseberries, bear forcing well. I hope to show them at the Crystal Palace on June the 2d. I was glad to observe by your report of the exhibition at Gore House that high-coloured fruit met with some attention. This in my opinion is the best test of excellence. *G. M'Ewen, Arundel.*

"*They manage things better in France.*"—Any one passing by the Tuileries at this time will see the fresh mark of the knife where the dead or rotten branch has been carefully cut away. Any one passing by our parks will see the dead or broken branches of last autumn's gales hanging in the trees. To particularise, opposite the end of Albion Street, Bayswater Road, there are several trees of no greater age than 30 years suffering at this moment from this disgraceful neglect; even at Naples you may see them cutting out the dead wood at this very time, but then the gardeners were bred gardeners, and not, as in our Woods and Forests, butlers, valets, or gamekeepers. *Somerset.*

Gooseberry Caterpillar.—In confirmation of my former recommendation to gather the pin-hole leaves with a view to get rid of this pest, I may mention that I am just come in from looking over 100 bushes—the operation has taken half an hour; I have found very few. My crop is large and safe, and even this late season I hope to partake of a green Gooseberry pudding in May. Having followed this plan several years, I am inclined to think the fly is nearly extinct in my garden. *T. C. Brown, Cirencester, May* 23.

Plant Stealers.—I think that you would be rendering a public service if you would put your readers on their guard against the depredators, who at this season rob the gardens of plants which are prepared for bedding out, or have just been put into the ground. I am led to write to you in consequence of my Fernery having been stripped of every scarce or fine plant on the morning of the 18th. The thief must have had a thorough knowledge of Ferns, as he left all the common sorts which to an ignorant eye would have appeared the most desirable. Great mischief arises from the readiness with which persons buy of itinerant dealers, who steal in one part of the country and carry their booty to sell in another. If ladies and gentlemen would only buy rare plants from parties of known respectability, the robbers would soon be driven to seek a more honest way of gaining a livelihood. *H., Beckenham.*

Societies.

Botanical of Edinburgh, *April* 12.—The President in the chair. The following papers were read:—1, On Placentation, by J. Cleland, Esq.; 2, Notes on the Flora of the neighbourhood of Castle Taylor, in the County of Galway, by A. G. More, Trinity College, Cambridge; 3, Notes on the Flora of the Bass Rock, by Prof. Balfour; 4, Notice of Plants collected during a trip to Loch Lomond, in July, by Prof. Balfour; 5, Register of the Flowering of Spring Plants in the Royal Botanic Garden, as compared with the four previous years, by Mr. M'Nab,

Note.—Between 10th March and 12th April, 1854, 65 spring flowering species were recorded, and during the same period this year only 22 of the species have come into bloom.

Mr. Evans stated that the first expanded flowers of the Apricot were observed in the Experimental Garden on 24th March, being about three weeks later than last year.

Entomological, *May* 7.—J. Curtis, Esq., F.L.S., President, in the chair. Various rare British insects presented to the Society's collection by Messrs. Bates and Plant, of Leicester, and books forwarded to the library by the Royal Society, the Entomological Societies of Paris and Stettin, the Natural History Society of Vienna, &c., were announced as having been received since the last meeting. Mr. Douglas read a notice by Dr. Boisduval on the nomenclature of the Indian silk moth, recently introduced into the south of Europe, and which had been considered as identical with Saturnia Cynthia, but which he considered as distinct, and accordingly named Sat. Ricioni, from the Castor-oil plant, upon which the caterpillar feeds. Mr. Douglas also called attention to a paper recently published by Herr Horning, giving an account of the early states of various species of micro-Lepidoptera, especially of the genus Phycita. Mr. Stainton called attention to the new work upon the Coleoptera of France, recently commenced by M. L. Fairmaire, and to the Bibliographical Report for 1851 and 1852 by Prof. Bohemann. Mr. Newman exhibited several rare Australian beetles, also a very remarkable variety of Cynthia Cardui captured at St. Lawrence, in the Isle of Wight, by Mr. G. Ingall; also Athous campyloides, a new species of Elateridæ, taken by Messrs. Forster and Dawson upon Elders in flower at Ramsgate. Specimens of the very rare moths Lophopteryx cucullina and L. carmelita, reared from the egg state, were exhibited by Messrs. Creed and S. Stevens. The latter gentleman also exhibited specimens of the Dicranocephalus, sent from China by Mr. Fortune, and which was considered in Paris as distinct from D. Wallichii. Mr. Stainton exhibited leaves sent from Calcutta by the Rev. Mr. Atkinson, infested by the minute mining larvæ of a Lithocolletes. The distribution of minute Lepidoptera, and other minute insects in tropical countries, led to a considerable discussion. Mr. Henry Doubleday communicated the description of a new and beautiful British species of Noctuidæ, from North Wales, which had been erroneously considered as Spælotis Valesiaca. A memoir by Mr. Lubbock was read, upon the entomostracous Crustacea of South America. The species described belonged to the genera Cypris, Diaptomus, and Daphnia. The president announced that M. Yersin, of Switzerland, was engaged on a monograph of the Gryllidæ and Locustidæ, and requested species from this country. The death of M. De Haan, of Leyden, one of the foreign honorary members of the Society, was also announced.

Reviews.

Principles of Agricultural Chemistry, with special reference to the late researches made in England. By Justus v. Liebig. 12mo, pp. 136. Walton and Maberly.

One object of this work, which may be regarded as the best of those which Professor Liebig has written on practical agriculture, is to show that the so-called "Mineral manures" manufactured by the advice of that eminent chemist, and which so signally failed to produce the effect expected, were right in principle and ought to have succeeded. Another object is to show that the conclusions arrived at by Mr. Lawes in his experiments upon agricultural chemistry, are not only not supported by evidence, but that the evidence produced goes to show the very contrary of what has been supposed.

"Of all the memoirs," says the author, "which have as yet appeared on this subject, that of Mr. J. B. Lawes, of Rothamsted, is the most remarkable, on account of the extent and duration of the experiments undertaken by him; and as the conclusion at which he has arrived, and the consequences which he has deduced from it, are in contradiction to the principles which I have laid down, I consider what he calls his practical criticism on scientific views as peculiarly adapted to serve as an example, by which agriculturists may be convinced how necessary it is to choose a correct method in the institution of experiments, if such experiments are designed either to convey instruction or to confirm or to refute views already promulgated.

"In fact, all the experiments of Mr. Lawes prove exactly the reverse of that which in his opinion they ought to demonstrate. Nay, I regard them as the most incontestable proofs in favour of that very doctrine, which they were originally intended to disprove; and the facts which he has established yield so many important lessons, in regard to the cultivation and manuring of the various soils, that I consider these facts of most especial value for the theory of agriculture."

We leave our learned and skilful friend at Rothamsted to reply at his leisure to these strictures, which have little or no horticultural application. If they had, we should, perhaps, feel inclined to say that although Professor Liebig may have been right, his advice was not suited to a highly cultivated country like England, however valuable it might have been in some impoverished districts, and could not well have been appreciated by those to whom it was addressed. We must, however, leave our agricultural friends to fight their own battle, and confine ourselves to a couple of extracts relating to general horticulture. The first is an explanation, in the concisest form possible, of the learned author's present views of the manner in which plants feed.

"The growth of a plant is preceded by a germ, which is contained in the seed. Land plants require a soil; and without *air* and *moisture* no plant can grow. The words soil, air, and moisture are not in themselves an expression of necessary conditions, for there are calcareous, clay, and sandy or siliceous soils, soils derived from granite, gneiss, clay slate or mica slate, and others, which are very different in their composition and quality. The word soil is a collective term for a large number of conditions; a fertile soil contains these in the due proportion required for the nourishment of plants; in a barren soil, some one or more of these conditions are wanting. In like manner, the words *manure* and *air* include a plurality of conditions. The chemist, with the means at his disposal, analyses all kinds of soils; he analyses also manures, the air, and

water; he decomposes the collective terms which express the sum of the necessary conditions into a number of single conditions, and in his explanations he substitutes these, in their proper place, for the collective terms. Now it is easy to see that in all this there is nothing hypothetical. If it be an established truth, that soil, air, water, and manure exert an influence on the growth of plants, it is no less certain that they can only do this by means of their constituent parts; and the duty of the chemist is to make known to the man who is occupied in the culture of plants these constituents, their properties, and their chemical action or behaviour.

"I now proceed to lay down the following propositions, which contain the views I hold and have taught on this subject.

"1. Plants in general receive their *carbon* and *nitrogen* from the air, the carbon in the form of *carbonic acid*, the nitrogen in that of *ammonia*. The *water* (and ammonia) yield to plants their *hydrogen*; the *sulphur* of those parts of plants which contain that element, such as the sanguigenous bodies, is derived from *sulphuric acid*.

"2. On the most diversified soils, in the most varied climates, whether cultivated in plains or on high mountains, *plants invariably contain a certain number of mineral substances, and, in fact, always the same substances; the nature and quality, or the varying proportions of which are ascertained by finding the composition of the ashes of the plants.* The mineral substances found in the ashes were originally ingredients of the soil; all fertile soils contain a certain amount of them; they are never wanting in any soil in which plants thrive.

"3. In the shape of the agricultural produce of a field, or in the crop, the entire amount of these ingredients of the soil which have become ingredients of the plants are removed from the soil. The soil is richer in these matters before seed-time than after harvest; or, in other words, *the composition of the soil after harvest is found to be changed.*

"4. After a series of years, and a corresponding number of harvests, the fertility of the soil or field diminishes. While all the other conditions have remained the same, the soil alone has not done so; it is no longer what it was at first. *The change which is found to have taken place in its composition is the probable cause of its diminished or lost fertility.*

"5. *By means of solid and liquid manure, or the excreta of men and of animals, the lost or diminished fertility of the soil is restored.*"

Forty-five other propositions follow, which may be regarded as a commentary upon the five here quoted, and must be studied in the work itself. To ourselves it is particularly satisfactory to see that Professor Liebig entertains the same opinion as we have always advocated, that on the whole there is nothing like farm-yard manure. Unfortunately it is impracticable to obtain anything like enough of it.

The second extract is the following:—

"Since the air contains a very limited amount of carbonic acid and ammonia, for 2500 volumes (cubic feet, miles, &c.) of air contain only one volume of carbonic acid, and a far smaller proportion of ammonia, the quantity of atmospheric food conveyed to the plants essentially depends on the change of the strata of air in contact with the plants. The air which has yielded up and lost its carbonic acid and ammonia must be replaced by fresh air, if a further absorption of these constituents is to take place. This change of air demands a certain time."

Here we have, expressed in the language of science, and supported by all the weight of chemical authority, a declaration that nothing can be more sound than the advice which we have never failed to offer to gardeners for many a long year in speaking of the ventilation of glass houses, and more recently while pointing out the unfitness of Ward's cases for cultivation, however well adapted they may be for preservation. Nine or 10 years ago it was asserted in these columns that plants require a continual change of the atmosphere which surrounds them, just as is the case with animals. "Give us air or we shall die!" was shown to be an exclamation which plants would not fail to utter had they the power of expressing feeling; all experience supports that opinion; gardeners are now impressed with its importance; and the great problem which has so long waited, and still waits, for a satisfactory solution, is how we are to effect that "change of the strata of air in contact with plants," which is absolutely indispensable to their healthy existence. To gardeners the sentence we have quoted would render Prof. Liebig's work acceptable even if it contained nothing further horticultural.

The Theory and Practice of Horticulture, by Professor Lindley. 8vo, pp. 606, with numerous woodcuts. Longmans. 24*s.*

This is a second edition of the "Theory of Horticulture," with the addition of a large quantity of practical matter, introduced to show how entirely scientific principles and good cultivation correspond. The volume contains about four times as much matter as the first edition, and for this increase the author is, as he states in his preface, largely indebted to the correspondents of this Journal;—it may indeed be regarded as an abridgment of all the more important horticultural evidence to be found in our volumes, put together in systematic order. Although very large additions are made to every chapter, while many passages in the first edition have been wholly struck out, it may be proper to say that the greatest changes are those which relate to vitality, climate, domestication, ventilation, propagation, pruning, resting, and soils and manures; such being the subjects in which practical men are most interested. The whole work has, indeed, assumed such a form as to make it evident that the great object of the author has been, not to produce a work suited to men of science, but one which every well-informed gardener may understand and apply. As the volume concludes with a very copious index of matter, there is no difficulty in ascertaining where any given subject is treated of.

We must not omit the words of the dedication, which are as follows:—"To the Right Honourable Thomas Francis Kennedy, lately one of her Majesty's Commissioners of Woods, Forests, and Land Revenues, who endeavoured to reform a public department in which unskilful management has been most disastrous, this edition of a work on the principles of cultivation is inscribed, as a mark of respect for high official character and ill-requited public services, by his faithful servant, the Author."

Garden Memoranda.

Messrs. E. G. Henderson's Nursery, Wellington Road, St. John's Wood.—The show-house here is at present gay with Pelargoniums, Calceolarias, Roses, Tropæolums, Verbenas, Rhododendrons, Azaleas, &c. Amongst the Verbenas was a scarlet one called Orb of Day, apparently an excellent sort for pot culture, as it grows little if any higher than common Mignonette, and it flowers most profusely. It is stated to be an American variety, four cuttings of which placed in a pot make a brilliant display. The Rhododendrons consisted of some good yellow, or rather buff, varieties, suffused with orange, and an almost pure white-flowered sort called Bianca. Among the Azaleas the most conspicuous was Iveryana, which is certainly one of the best of the striped kinds. The common yellow Flax (Linum flavum) was also flowering freely here; it makes a pretty plant for a greenhouse shelf at this season of the year.

A kind of winter garden has been made here by removing the partition between two houses, and thus throwing them into one, taking away the stages, and arranging the plants in groups on the floor, which is traversed by a 3-feet broad gravel walk that winds in a zig-zag manner from one end of the house to the other. At present Camellias form the bulk of the clumps which, when in bloom, must have had a brilliant appearance, and here and there where they can be seen to most advantage, some very fine standard and pyramidal Bays have been introduced, as well as Araucarias and other Conifers, among which we remarked a fine specimen of Libocedrus Doniana and L. chilensis grafted on the common Arbor-vitæ, on which it was more bushy and healthy looking than plants raised from seed. The flowering plants here consisted of the sweet-scented Rhododendron Gibsoni; Deutzia gracilis, in the form of standards with heads loaded with white flowers; Azaleas, among which the most striking was perhaps Beauty of Europe, a variety in the way of variegata but with more red in it; Bouvardia longiflora, a greenhouse shrub with snow-white heads of Jasmine-like flowers, which continue to be developed in succession the whole year round; and some plants of Dielytra placed on rock-work round a cistern in the centre of the house. The above arrangement has had many admirers, and at the same time it has afforded means of wintering under glass many tall plants which it would otherwise have been difficult to know how to conveniently accommodate.

A span-roofed house for New Holland plants has also lately been erected here. It is 120 feet long, about 8 feet high, and 11 feet wide, and has a sunk path down the middle. It is ventilated at top and through apertures (fitted with wooden shutters) in the brickwork at the sides, and a 3-inch hot-water pipe has been carried all round it. The beds on which the plants stand are surfaced with gravel, which can be moistened and kept cooler in summer than shelves. The roof is upheld by iron supports in the form of arches placed over the footpath. Among plants in it, all of which are yet young, were some examples of the beautiful Boronia Drummondi, covered with brilliant rosy flowers. The common Spiræa japonica was also finely in blossom. This, lifted out of the borders in spring and potted, forces well, and will be found extremely useful where a good display of flowers has to be kept up. We also observed here plants of a dwarf-growing Hibbertia called Reidi, gay with a profusion of yellow flowers, together with Pimeleas and other plants more commonly met with. In another house was a sweet-smelling Cytisus in the way of filipes; also Acacia Drummondi, one of the handsomest of all the Acacias for pot culture; and a fine specimen of Hederoma tulipiferum, which has been shown so finely this year.

In one of the stoves we noticed the Rice paper plant, numerous seedlings of Lapageria rosea, and among other plants remarkable for fine foliage, two Begonias, one called picta, a handsome sort; the other an unnamed kind (imported from Java by Messrs. Rollisson), covered all over so thickly with long red hairs as to give the leaves and stems a rich crimson appearance.

As regards Geraniums, after trying all the variegated varieties for bedding, Messrs. Henderson have arrived at the conclusion that Silver Queen is the best; it grows and flowers freely, and its leaves do not crumple up so much as those of the others; its flowers are rosy pink. Cloth of Silver is one of the best light fancy varieties of the season, and Evening Star one of the best dark sorts; the latter is an improvement on Caliban. Among scarlets with horse-shoe leaves, Baron Hugel *aliàs* Princess Royal is dwarf and useful for bedding purposes, as are also Pretty Polly, a scented cut-leaved variety, of the old Fair Helen class, but larger and much brighter in colour; and Nutans, a crimson flowered kind, which is very neat and dwarf.

Among rare Conifers were Wellingtonia gigantea, Libocedrus decurrens *aliàs* Thuja gigantea, Torreya myristica, and Cephalotaxus Fortuni, which has withstood the winter out of doors in places near London.

Of Bootan and Sikkim Rhododendrons there are great quantities here; but as yet none of them have flowered except R. Dalhousieanum and Edgeworthi; the former has had six blooms in a truss which, when they first open, are pale green, but afterwards they change to white.

Out of doors early Tulips were in full bloom, and among hardy plants in pots Primula involucrata was a mass of white flowers.

FLORICULTURE.

Ranunculuses.—In a dry season like the present, the following advice by Messrs. Tyso regarding the watering of Ranunculuses will doubtless be acceptable:—Genial showers in April and May are essential to a vigorous and healthy growth. The Ranunculus delights in a moist soil, and if there be a deficiency of rain in May, water must be plentifully supplied, just at the time the flower buds are appearing. This is a critical period, and for lack of moisture many plants fail to bloom, and send up only an abortive flower stem. Water from a pond or brook is better than from a well; if such cannot be obtained fill a large vessel with water from a pump, and expose it to the sun and air before use. It should be applied (morning or evening, according to the state of the temperature) between the rows, from a spouted pot, and not over the foliage, except in cloudy and showery weather. It may appear an anomalous direction to water in wet weather, but advantage should be taken of a shower falling to give a generous watering, as the plants are then naturally in a better state to receive moisture than in dry weather, when their pores are contracted. As a general observation, it is better to water copiously three times a week, than to administer a small quantity every morning and evening. To obtain fine blooms for exhibition a little weak manure water may be occasionally given. We have tried numerous natural and artificial guanos, &c., in some instances without perceptible benefit, and in others with positive injury. The most simple and useful agent we know of is superphosphate of lime, reduced to fine powder, and mixed with the water. We are aware that many connoisseurs have been at first delighted with the luxuriant foliage of their plants, traceable to potent doses of liquid manures of varied name, but the apparent benefit has in almost all instances been realised at the future risk of the health of the tubers. We are not adverse to novelties, because they are such, but to the experimentalist we would speak the language of caution. Try your hand on a small scale only; never apply a new nostrum on a larger portion of stock than you can afford to lose.

Running of the Carnation.—The experience and observation of some years incline me to reject the idea that compost can in any material degree either induce or prevent the propensity to sport observable in the Carnation, which we term running. I have, by way of experiment, grown them in soils of various degrees of richness, from pure sandy loam to unalloyed decomposed animal manures, with about equal results in that respect. Take a given number of plants propagated from the same original, pot them in the same pot, and some will probably be run. I cannot, therefore, understand why, if the compost were in fault, the effect should be partial. I have also observed, that in some summers the complaint of an unusual number of run flowers will be pretty general in a particular district; and it is scarcely possible to suppose that the composts used by several growers could all be precisely the same. It appears to me that we must look elsewhere for a solution of the mystery. I view it simply as a natural tendency to sport (observable in other flowers besides the one in question), and though that inclination most frequently is to return to the natural self colour of the original type, yet instances are not wanting of its taking an opposite direction. Thus Ely's Lady Ely (R.F.) is a sport from Ely's Duke of Bedford (C.B.), as Fletcher's Duchess of Devonshire (R.F.) is also from Gregory's King Alfred; while Puxley's Prince Albert, classed as a P.B., is often a very high coloured C.B., and has positively sported to an S.B. Moreover, it does not follow that because the one or two leading blooms which the plant is alone suffered by florists to bear happen to run, that the lower ones, if they had been permitted to remain, would have been in that condition. I have seen a leading bloom of Beauty of Woodhouse (P.F.), a purple self, or clove, and the second flower on the same stem a pure white; I turned out, a season or two ago, into the border what I supposed from the bloom in the pot to be a run Ward's Sarah Payne, but late in autumn it produced a bloom low down on the stem perfectly clean. Flaked flowers are not to be condemned as run if you can perceive the smallest stripe of pure white in them. I have observed that the progeny of such is usually finely marked the ensuing season. Do not, however, mistake white spots caused by thrips for the natural white of the flower. Many sorts supposed to be run will return; this has happened with Martin's

President (P.F.), Sharp's Defiance (S.B.), and many others. The chances of clean flowers are not equal, whether you propagate from run or clean flowers, by which I mean to intimate that as many plants will probably return to fineness from the one as from the other. As for compost, I should pronounce half dung, which some use, to be excessive, keeping in view the ultimate soundness of the stock. By no means should the loam employed be deprived of any of its fibrous rooty matter; that I consider the most valuable part of it. *N.*

Mr. Groom's Tulips.—These are now in perfection, and we can promise our readers that a sight of them will amply repay a visit. The bed, 150 feet long, and containing not less than 2000 flowers, is as fine, notwithstanding the severe winter and spring we have had, as ever we remember to have seen it. Next week we hope to be able to offer a few remarks on some of the varieties in this, as well as in some other beds in the neighbourhood of London.

SEEDLINGS.

Pelargoniums: *J. Dennis.* Your new variety called Alma is bright rosy pink, with a dark spot on the upper petals; it is apparently a profuse bloomer, has good foliage, and will doubtless be found useful for all ordinary purposes of decoration.

Miscellaneous.

The cultivated Beets are referred by Italian botanists to two species, of which one only, Beta cicla, is admitted to be of native origin, whilst the true Beta vulgaris is stated to be indigenous to Central Asia, Egypt, and the shores of the Mediterranean, to the exclusion of Italy. Moquin-Tandon has, however, more correctly reunited the whole under the Linnean name of Beta vulgaris, of which he reduces the numerous forms to three principal races: First, the Wild Beet, with a slender, hard root, sparingly introduced into kitchen gardens for the foliage, occasionally cooked with sorrel to diminish the acidity of the latter. Second, the White Beet, poirée, or poirée-carde of the French, with a thicker, but still hard root, with enlarged leaves and a great tendency to succulence in the petioles, which are blanched like Cardoons for culinary purposes. This vegetable is frequently mentioned by ancient Greek and Roman writers. Third, the Beet root, Barbabietola of Italian gardens, Betterave of the French, so well known for its sweet and succulent root, was first introduced into Italy in the sixteenth century, from Germany, where it was probably first produced. A sub-variety of the Beet-root, with a somewhat coarser and larger root, now become so important an article in agriculture, was originally put forward under the name of root of scarcity, racine de disette in French, or Mangel Wurzel in German, which latter translation is now adopted by our farmers, absurdly corrupted into Mangold Wurzel. *Journal of Horticultural Society.*

Calendar of Operations.

(For the ensuing week.)

PLANT DEPARTMENT.

Conservatory, &c.—As soon as the cold frames and pits can be got cleared of the bedding stuff they should be occupied as far as circumstances will admit with young stock of hard-wooded plants for the summer growth, of which they are much more suitable than large houses, however well arranged. These humble structures will also be found very suitable for the growth of the dwarf Lobelias, Balsams, Salvia splendens, S. gesneræflora, and many other things which are generally grown for flowering in the conservatory in summer and autumn; and indeed most things which require only a moderate temperature will be more manageable here and thrive better than they will in lofty houses with double the attention. But the great advantage of having plenty of spare pits and frames at command for the summer growth of plants is that it allows of a greater division of the plants, and arranging them so that the treatment may be adapted to the circumstances and requirements of the plant with greater nicety than it is possible to do when plants from many very different habitats have to be managed in the same house. And besides the difference of treatment, which it is necessary to observe in the case of different plants which are similar in every respect, merely through the one being making vigorous growth, while another may be ripening its wood, &c., there is more advantage in being able to classify things during the growing season than is generally supposed, save by our best growers. Roses are, perhaps, the most generally admired of all winter flowering plants, and where there is not a stock of established plants for this purpose, if a lot of young plants can be procured and placed in a frame they will make nice stuff by autumn if properly attended to, especially if the frame can be placed on a bed of leaves or tan to afford a gentle bottom-heat, which will greatly assist in inducing a vigorous root action. Now that the weather has become somewhat milder, air should be given more liberally, and when there is no danger of frost, a little back air may be left on for the night. Attend to former directions as to keeping insects under, and supplying beds and borders liberally with water. Greenhouse.—If any of the young stock has not yet been examined for the purpose of ascertaining whether it requires more pot room, this should be done the first possible opportunity, repotting such as require it, and a liberal shift may be given with propriety at this season to things in a vigorous state. Great care should be used, however, to have the balls in a nice healthy state as to moisture, and also the soil to be used; and the plants should be exposed as little as possible to sunshine, or drying currents of air, for a fortnight or so after potting. Careful and judicious watering is at all times essential to successful plant growing; but at no period of a plant's existence is this so important as while the roots are surrounded with fresh soil, and many a promising plant has been ruined by one or two inadvertent applications of water while in this state. If both the ball and soil are in a properly moist state when potting is performed, water need not be given for two or three days; and when it is deemed necessary to water, enough should be given to thoroughly soak the whole of the soil. Large specimens of Heaths and other hard-wooded things must also be very carefully supplied with water, and every precaution should be used to make sure that the ball is in an equal state as to moisture throughout; for it sometimes happens that the surface of the ball will appear quite wet, while below (where the greater part of the roots is) is too dry. This is the result of practising the dribbling system of watering, and is not likely to occur where watering is done properly. The readiest and safest way of moistening the lower part of the ball, when this is found to be dry while the upper part is wet, is to place the pot in a saucer or tub of water for a few hours, letting the water stand about an inch above the drainage.

FLOWER GARDEN AND SHRUBBERIES.

In ordinary seasons the planting out of bedding stock has been finished in most parts of the country by this time, but notwithstanding the advanced period of the season the weather is yet anything but settled or promising, and save in favourable localities there is still considerable apparent risk in planting out such things as have not been well hardened off, or those that are very easily injured by frost, as Heliotropes, &c. And we would recommend that these should be kept where they can be securely covered in case of need until there is a fair prospect of fine weather, repotting them if necessary to prevent their getting into a hard state. Bedding stock has been considerably more troublesome and expensive this season than usual, and it would be folly to risk such things as cannot be replaced should they be destroyed, for we shall doubtless have summer weather soon, and the owners of gardens expecting to see them in full beauty; and if gardeners can exercise sufficient patience to defer planting out until the right time, there is good reason for hoping that things will start away freely, and under the influence of fine weather soon cover the beds with flower. Those who can command covering may doubtless plant out anything at once with safety, provided the plants are in proper condition for planting out; but weakly stock should not be risked out under any conditions until the weather becomes warm, and appears settled. A sprinkling of evergreen branches stuck into the beds will afford the plants considerable protection from cold winds and bright sunshine. These should be cut rather short, and stuck firmly into the ground, so as to prevent their being blown about and injuring the plants. And every shoot of Verbenas, &c., which is long enough to be liable to be blown about should be pegged down before leaving them. Keep the work of this department as forward as possible, so as to be able to command sufficient strength for planting out the bedding stock expeditiously, and avoid having the litter and confusion consequent on this work about longer than can be avoided. In the present dry state of the ground a good watering should be given after planting, to thoroughly moisten the bed, but this should not be done at night when there is the least chance of frost.

HARDY FRUIT AND KITCHEN GARDEN.

Continue to watch for and destroy insects on fruit trees directly they make their appearance, and examine weakly Peach trees for mildew, and apply sulphur immediately this pest is perceived. Also attend to disbudding in a gradual manner, so as not to check the trees by removing too many shoots at once, and regulating the growth of trees intended to be trained in any particular form by timely stopping, so as to secure growth where it is wanted. Asparagus can hardly have too much manure-water at this season, and in the present state of the ground, and a liberal supply should be given once or twice a week from the farm or stable-yard tank. Save on heavy clayey soils a liberal dressing of salt may be used instead of manure-water, and will be equally beneficial; but salt should not be used on very heavy soils, for although it may improve the present crop, it is very apt to cause the roots to decay in winter through keeping the soil too wet. Attend to plantations lately made, giving sufficient water to keep the soil moist. Get in a good breadth of Knight's Dwarf Green Marrow Pea, or some other hardy variety that will be likely to resist the attacks of mildew, and produce a late crop. At this season the soil can hardly be too deep and rich for Peas; and it is a very good plan to plant in trenches prepared as for Celery, only the manure should be incorporated with the soil and the trenches filled up nearly to the level of the ground. Get Tomatoes planted out against parts of the walls not otherwise occupied as soon as the weather may be considered safe; also ridge Cucumbers, vegetable Marrows, &c., in the places prepared for them, protecting with hand-glasses until the plants get into full growth. Sow Cauliflowers for late autumn use, and give every attention in the way of watering, &c., to those recently planted out.

STATE OF THE WEATHER AT CHISWICK, NEAR LONDON,
For the week ending May 21, 1855, as observed at the Horticultural Garden.

The highest temperature during the above period occurred on the 28th, 1847—therm. 91 deg.; and the lowest on the 27th, 1836—therm. 33 deg.

Notices to Correspondents.

Azaleas: *A Van Geert.* Your Indian Azalea is distinct, of good form and substance, and better than many of the recent novelties. *G.—J C.* All pretty, but not different from kinds we already possess.‡

Allamanda neriifolia: *H O.* It was introduced into this country from South America.

Books: *R S.* Roberts on the Vine is a very good book, with the exception of what relates to carrion, which should never be used for Vines.‡

Broccoli: *Melville.* It was too far gone before it reached us, for us to offer any opinion on it.‡

Cockroaches: *W M C.* A basin with water in it let into the floor in their runs makes the best trap we know of. By perseverance in the use of it they may be got rid of.

Diseases: *Amicus.* It is an aggravated case of rust, remarkable for the development of the tissue between the little discs into which the cuticle is broken up. Rust equally arises in the first instance from some substance rubbing against the fruit, when the cuticle is very delicate. With this hint you will possibly be able to discover the cause, and prevent the recurrence of the affection. You cannot do anything this year, now the Grapes are formed.—*A B.* This is an ordinary case of the disease which is so prevalent amongst Melons and Cucumbers. It seems almost universal, and the cause is wholly unknown. We are trying what can be done with old seed, but we are not very sanguine as to the result.—*J W.* Your leaves appear to have been injured by frost; they were, however, so crushed that we can say little about them. The plants which accompanied them are Luzula campestris and Carex præcox. *M. J. B.*

Greenhouse Climbers: *N.* Clematis azurea grandiflora, Dolichos lignosus, Hardenbergia macrophylla and monophylla, Kennedya Marryattæ, Mandevilla suaveolens, and Tropæolum Triomphe de Gand may possibly answer your purpose.‡

Hollies: *X Y Z.* The most complete account of these is, we believe, in the *Allgemeine Gartenzeitung* of 1854.

Lizard's Eggs. If any of your readers could obtain for me some eggs of the Lacerta agilis, I should be greatly obliged. Lizards are most widely distributed, and I want to ascertain whether the eggs will float in sea-water, and, if so, whether they will retain their vitality. A reward of a few shillings (which I would gladly repay as well as postage) offered to schoolboys, would perhaps get these eggs in the proper districts collected. *Ch. Darwin, Downe, Farnborough, Kent.*

Insects: *E K S.* Your Peas are attacked by the common weevil, Curculio (Sitona) lineatus (see *Gardeners' Chronicle*, 1844, p. 38[illegible] for figure and description), which the long dry spring has brought forth in vast numbers everywhere. Watering the plants with lime-water and strewing soot thickly along the rows are advantageous; sticks or twine fastened close over the rows, daubed with bird-lime, would also catch multitudes.—*J G.* Thanks for the note about the Anobium pertinax attacking the Spanish Chesnut timber; all kinds of wooden structures seem, however, to come alike to these devastators. *W.*—[illegible] There is no poisonous preparation that we know of which, mixed with water and applied with the syringe, would be effectual in killing "the grub" on your Plum trees. White Hellebore powder, if good, appears to be fatal to the Gooseberry Caterpillar.

Names of Plants: We have been so often obliged to reluctantly decline naming heaps of dried or other plants, that we venture to request our correspondents to recollect that we never have or could have undertaken an unlimited duty of this kind. Young gardeners, to whom these remarks more especially apply, should bear in mind that, before applying to us for assistance, they should exhaust their other means of gaining information. We cannot save them the trouble of examining and thinking for themselves; nor would it be desirable if we could. All we can do is to *help* them—and that most willingly. It is only requested that, in future, not more than four plants may be sent us at one time.—*B M.* Epidendrum aromaticum, a Mexican, not Brazilian plant.—*G Chambers.* We believe there is no doubt that your plants are seedling Rushes with the remains of the seed sticking to the end of the lengthened cotyledon.—*Constant Reader.* If the plant came from Brazil somebody must have taken it there from New Holland. It is Callistemon rigidum.—*H Beddard.* Allosorus flexuosus.—*E J W.* Lastrea sylvatica.—*A Sub.* Polygala cordifolia.—*P F.* Asplenium Filix-fœmina. *S.*—*O H P.* 1, Asplenium ebeneum; 2, Lastrea decomposita; 3, Doodia caudata; 4, Nephrolepis pectinata. *S.*—[illegible] *Beginner.* The name is quite right.

Plant Showing: *A K.* Although the Allamandas you name may be considered "distinct species," yet four of them would be too many to show in a group of ten plants; if they did so, it would absolutely disqualify your collection from gaining a prize, as many plants of one colour would at least greatly damage its value.‡

Trees and Horseradish: *Staines.* There is nothing in Horseradish that we know of poisonous to trees. The dying of the latter in your case may be owing to the Horseradish above their roots having exhausted the soil.‡

Vine Leaves: *R B W.* Little injury need be apprehended from the excrescences on the under sides of your Vine leaves, though it is not good to feed Vines till they break out to the extent that yours have done. They are over fed, and have broken out in eruptions. Over luxuriance, too damp an atmosphere and imperfect ventilation cause the mischief.‡

*** As usual, many communications have been received too late, and others are unavoidably detained till the necessary inquiries can be made. We must also beg the indulgence of those numerous correspondents, the insertion of whose interesting contributions is still delayed.

PERUVIAN GUANO, Bolivian Guano, Superphosphate of Lime, Nitrate of Soda, Sugar Scum, and every description of Artificial Manures, Linseed Cakes, &c.
WM. INGLIS CARNE, 10, Mark Lane, London.

TURNIP SOWING.—The Undersigned beg to offer their valuable Supherphosphate of Lime (See "Royal Agricultural Society's Journal," Vol. VI., Part 2), Turnip Manure, and Nitro-phosphate or Blood Manure.

Also on sale, Guano, Nitrate of Soda, Gypsum, Bone-dust, Sulphuric Acid, Salt, and all other Manures of known value. Agents for the sale of Peat Charcoal.—Apply for Prices Current to MARK FETHERSILL & Co., 204A, Upper Thames Street, London.

PATENT SANITARY SEWAGE COMPANY'S NITRO-PHOSPHATED CARBON OR BLOOD MANURE, 8l. 10s. per ton: delivered in London, bags included. Each ton contains 1350 lbs. Blood and 11 per cent. of Phosphate of Lime.—Agents throughout the country.—22, Lincoln's Inn Fields, London.

FOR THE PRICE CURRENT OF MANURES.
NITRO-PHOSPHATE AND AMMONIA PHOSPHATE, manufactured by HODGSON & SIMPSON, Wakefield, and MATTHEWS & Co., Driffield, 8l. per ton.

MANURES.—The following Manures are manufactured by HODGSON & SIMPSON, Calder Soap Works, Wakefield, and MATTHEWS & Co., Manufacturing Agricultural Chemists, Driffield. SIMPSON'S AMMONIA PHOSPHATE, a valuable Top-Dressing for Wheat, Barley, and Oats. SIMPSON'S NITRO-PHOSPHATE for Turnips, Potatoes, and all other bulbous root crops. N.B. Manures specially prepared for Grass and Flax. The above have been successfully tested for the last Seven Years by the leading farmers in Yorkshire and Lincolnshire, and other counties, and were applied last season to a breadth of upwards of 15,000 acres of land with the most beneficial results to the crops. A List of Testimonials and other particulars will be forwarded by post on application.

THE FOLLOWING MANURES are manufactured at Mr. LAWES' Factory, Deptford Creek:—Turnip Manure, 7l. per ton; Superphosphate of Lime, 7l.; Sulphuric Acid and Coprolites, 6l.
Office, 69, King William Street, City, London.
N.B. Genuine Peruvian Guano, guaranteed to contain 16 per cent. of ammonia. Nitrate of Soda, Sulphate of Ammonia, and other Chemical Manures.

CORN MANURE FOR SPRING SOWING.
CONCENTRATED URATE FOR GRASS, RAPE, AND ALL ROOT CROPS.
SUPERPHOSPHATE OF LIME.
THE LONDON MANURE COMPANY continue to manufacture the above Manures, which have been used with so much success for the last 14 years.
The London Manure Company also supply PERUVIAN GUANO (direct from importers' warehouses), Nitrate of Soda, Sulphate of Ammonia, Fishery and other Salts, Bone Dust, and every artificial manure of known value. EDWARD PURSER, Sec.
Office—40, Bridge Street, Blackfriars.

TO AGRICULTURISTS.
BONE MANURE MANUFACTORY, DRAKE'S PLACE, PLYMOUTH.
PONTEY, ROWE AND CO. beg to acquaint the Agriculturists in the West of England, that in order to insure a supply of their MURIOPHOSPHATE, which has been tested 12 years, and found far superior to all other Artificial Manures, in the continual support it yields to TURNIPS and the succeeding crops, they have made considerable purchases of BONES and BONE ASH, from South America, Hamburgh, &c., on favourable terms, They will therefore be enabled to render their Muriophosphate the same strength as heretofore, at 7l. per ton in bags free on board; or 7l. 5s. delivered to the principal Seaports in Devon and Cornwall.
They have obtained reports of the Analysis from the most celebrated Agricultural Chemists, Messrs. Herapath, Nisbet, and Way, and they will guarantee that they supply the same article as reported on. The Analysis referred to will be open to the inspection of purchasers.
P., R. & Co. have constantly on sale BONE MANURE of their own manufacture at their Mills, at Drake's Place, which is open to purchasers. Also best PERUVIAN GUANO from A. Gibbs & Co., GYPSUM, MANURE SALT, &c., prices of which can be obtained at the Manufactory, or of Mr. PONTEY, Seedsman, Cornwall Street. 2½ per cent. off for cash on delivery.
Also London Manufactured BONE MANURE.

CHEMICAL ANALYSIS.
MR. H. MEDLOCK (formerly Chief Assistant in the Royal College of Chemistry) begs to inform Agriculturists that he undertakes the Analysis of Soils, Manures, &c., on moderate terms. Mr. Medlock also gives instruction to Gentlemen in Agricultural Chemistry at his private Laboratory, 20, Great Marlborough Street, London.

ARTIFICIAL MANURES, &c.—Manufacturers and others engaged in making ARTIFICIAL MANURES may obtain every necessary instruction for their economical and efficient preparation, by applying to J. C. NESBIT, F.G.S., &c., Principal of the Agricultural and Chemical College, Kennington, London. Analyses of Soils, Guanos, Superphosphates of Lime, Coprolites, &c., and Assays of Gold, Silver, and other Minerals, are executed with accuracy and dispatch.
Gentlemen desirous of receiving instructions in Chemical Analyses and Assaying, will find ample facility and accommodation at the College.

THE LANDS IMPROVEMENT COMPANY, INCORPORATED BY SPECIAL ACT OF PARLIAMENT FOR ENGLAND AND SCOTLAND.—To Landowners, the Clergy, Solicitors, Surveyors, Estate Agents, &c.—Loans may be contracted for the execution by the proprietor or by the Company of every landed improvement, especially Drainage, Building, Clearing, Enclosing, Warping, Irrigation, Embanking, Reclamation, Roads, Planting, Machinery, &c. The plans (of buildings), specifications, and estimates are prepared by the proprietors, and are submitted to the approval of the Enclosure Commissioners. Proprietors may avail themselves of the powers of the Act to recover from the inheritance their own funds to be expended on improvements. They may also apply jointly for the execution of a mutual improvement, such as a common outfall, &c. For forms of application, &c., apply to the Hon. WM. NAPIER, Managing Director, 2, Old Palace Yard, Westminster.

THE GENERAL LAND DRAINAGE AND IMPROVEMENT COMPANY
INCORPORATED BY SPECIAL ACT OF PARLIAMENT.
Offices, 52, Parliament Street, London.
DIRECTORS.
HENRY KER SEYMER, Esq., M.P., *Chairman.*
SIR JOHN V. SHELLEY, Bart., M.P., *Deputy-Chairman.*
George Thomas Clark, Esq.
John C. Cobbold, Esq., M.P.
Sir William Cubitt, F.R.S.
Henry Currie, Esq.
Thomas Edward Dicey, Esq.
William Fisher Hobbs, Esq.
Edward J. Hutchins, Esq., M.P.
Sir S. M. Peto, Bart.
William Tite, Esq., F.R.S.
William Wilshere, Esq.
Empowered to execute Drainage, Road-making, and other Land Improvements, and to Erect Farm Buildings upon Estates under Settlement, Mortgage, or otherwise; or Church property, and without investigation of Title to charge the whole outlay and expenses upon the Estate, to be repaid by instalments spread over any period determined by Landowners within the limits of 30 years for Drainage and Roads, and 31 years for Farm Buildings. Landowners may arrange with the Company for the execution of the works by their own agents, with the use of their own or the Company's Capital.
WILLIAM CLIFFORD, Sec.

COLLEGE OF AGRICULTURE AND CHEMISTRY, AND OF PRACTICAL and GENERAL SCIENCE, 37 and 38, Lower Kennington Lane, Kennington, near London.
Principal—J. C. NESBIT, F.G.S., F.C.S., &c.
The system of studies pursued in the College comprises every branch requisite to prepare youth for the pursuits of Agriculture, Engineering, Mining, Manufactures, and the Arts; for the Naval and Military Services, and for the Universities.
Analyses and Assays of every description are promptly and accurately executed at the College. The terms and other particulars may be had on application to the Principal.

YORKSHIRE AGRICULTURAL SOCIETY.—The following Prizes are offered for Essays and Reports:—
On the Advantages of Cleaning Land in the Autumn ... £10
On the Management of Grass Land 10
On the Comparative Merits of Deep and Shallow Ploughing 10
The Essays must be sent in before the 1st of August, and particulars of competition may be obtained of the Secretary.
Advertisements for insertion in the "Transactions of the Society," which will be published in June, must be sent to the Printer, Mr. Coultas, York. JOHN HANNAN, Sec.
Kirk Deighton, Wetherby, May 26.

SPOONER'S PATENT WATER AND MANURE DRILL. — Manufacturers: TASKER & FOWLE, Andover, Hants; and GARRETT & SONS, Saxmundham, Suffolk, to whom orders may be sent; or to the Inventor and Patentee, W. C. SPOONER, Eling, Southampton.

TO ARTIFICIAL AND CHEMICAL MANURE MANUFACTURERS AND MANUFACTURING CHEMISTS.
MR. COOKE, CHEMICAL ENGINEER & MANUFACTURING CHEMIST, contracts for the erection of Sulphuric Acid Chambers, and Chemical Plant generally on the most approved forms. Practical instructions from 12 years' experience in the trade given in the working of Acid Chambers, and in the manufacture of all kinds of Artificial Manures, Superphosphates, and Guanos. Receipts for the best mixtures furnished, and other information on application.—For terms, &c., apply by letter to 6, St. Thomas Terrace, Newcastle-on-Tyne.

STEPHENSON AND PEILL, 61, Gracechurch Street, London, and 17, New Park Street, Southwark, Manufacturers of Copper Cylindrical and Improved Conical Iron BOILERS, and Conservatory and Hothouse Builders, either in Wood or Iron, respectfully call the attention of the Nobility, Gentry, and Nurserymen to their simple but efficacious method of warming Horticultural and other Buildings by Hot Water.
From the extensive works they have executed, references of the highest respectability can be given, and full particulars furnished on application.

"FRIGI DOMO."—Patronised by her Majesty the Queen, the Duke of Northumberland for Syon House, His Grace the Duke of Devonshire for Chiswick Gardens, Professor Lindley for the Horticultural Society, Sir Joseph Paxton for the Crystal Palace, Royal Zoological Society, Mrs. Lawrence, of Ealing Park, and — Collier, Esq., of Dartford.
PROTECTION FROM MORNING FROST.
"FRIGI DOMO," a Canvas made of patent prepared Hair and Wool, a perfect non-conductor of Heat and Cold, keeping, wherever it is applied, a fixed temperature. It is adapted for all horticultural and floricultural purposes, for preserving Fruits and Flowers from the scorching rays of the sun, from wind, from attacks of insects and from morning frosts. To be had in any required length, 2 yards wide, at 1s. 6d. per yard run, of ELISHA THOMAS ARCHER, whole and sole manufacturer, 7, Trinity Lane, Cannon Street, City, and the Royal Mills, Wandsworth, Surrey; and of all Nurserymen and Seedsmen throughout the kingdom.
"It is much cheaper than mats as a covering."

MOORE'S PATENT VENTILATOR, for every Description of Farm-Buildings, Conservatories, Hot-houses, Warehouses, Market-houses, Bell-turrets, also for Ventilating Shafts, &c.
These Ventilators are fitted to side-slips of wood with iron levers, iron flanges, and brass screws, with rough plate, or 32 oz. sheet glass, at 4s. per foot super. 2s. 6d. extra for necessary fittings to each Ventilator. If with brass levers in place of iron, 4s. per pair extra. It is presumed the accompanying drawing of a Greenhouse will show the advantages obtained (independent of a most perfect system of Ventilation, by admitting any amount of fresh air and distributing equally over the plants, &c., and at the same time emitting the vitiated), viz., a much neater appearance, and an uninterrupted view of the whole interior. Greenhouses at Mr. James Veitch, Jun., Exotic Nursery, King's Road, Chelsea; Messrs. Veitch & Sons, Nursery, Exeter; Messrs. Messrs. Perry, Nursery, Banbury; and the Pleasure Grounds at Hampton Court Palace; having been fitted with these Ventilators with perfect success, the Patentee has obtained permission to refer to the above places all parties desirous of seeing the same.
These Ventilators have been applied to many other Greenhouses, Conservatories, &c., but they are not published, in order to avoid giving unnecessary trouble. Fifty-four of these Ventilators, 5 ft. square (34 on the roof at an angle of 60 degrees), have been fitted at Her Majesty's Saltpetre Works, Waltham Abbey; the success of which has been proved by the fact, that the saltpetre is crystalised in little more than half the time, previously to the light and ventilation obtained by the adoption of these Ventilators.
MOORE'S double-current Ventilators for External Walls, &c. Ventilators for every description of apartment, from the Cottage to the Palace. Stained and Ornamental Glass if required. In taking the size, the exact opening should be given, stating the height and width distinctly. Tariff Prices of the ordinary Ventilators may be had on application at either of the above addresses. Packing cases allowed full price when returned free.
N.B.—These Ventilators can be readily fitted to Greenhouses already erected, by removing the entire sashes and fixing the Ventilators in their places.
PERFECT VENTILATION IN ALL CASES GUARANTEED.
Church, Turret, Musical and House Clock Makers, to the Lords of the Admiralty, the Hon. Board of Ordnance, the Emperor of China, &c.
London: 81, Fleet Street, London.—Manufactory, Sekford Works, Clerkenwell.

SCYTHES.
BOYD'S PATENT SELF-ADJUSTING SCYTHES may be had of the Manufacturers, WILLIAM DRAY & Co., Swan Lane, London; and of all Ironmongers and Seedsmen. A liberal allowance to the trade.

INGLIS AND CHISHOLM, Charles Street, Garratt, Manchester, make STEAM ENGINES for Agricultural and other purposes of the best quality at a reasonable price.—Address INGLIS & CHISHOLM, Charles Street, Garratt, Manchester.

WATERPROOF PATHS.
BARN AND CATTLE SHED FLOORS.
THOSE who would enjoy their Gardens during the winter months should construct their walks of PORTLAND CEMENT CONCRETE, which are formed thus:—Screen the gravel of which the path is at present made from the loam which is mixed with it, and to every part of clean gravel add one of sharp river sand. To five parts of such equal mixture add one of Portland Cement, and incorporate the whole well in the dry state before applying the water. It may then be laid on 2 inches thick. Any labourer can mix and spread it. No tool is required beyond the spade, and in 48 hours it becomes as hard as a rock. Vegetation cannot grow through or upon it, and it resists the action of the severest frost. It is necessary, as water does not soak through it, to give a fall from the middle of the path towards the sides.
The same preparation makes first-rate paving for BARNS, CATTLE-SHEDS, FARM-YARDS, and all other situations where a clean, hard bottom is a desideratum. May be laid in winter equally well as in summer.
Manufacturers of the Cement, J. B. WHITE & BROTHERS, Milbank Street, Westminster.

SAMUELSON'S REGISTERED LAWN MOWING MACHINES. To cut 16, 19, 22, and 25 inches wide. The Registered Improvement renders unnecessary the great care requisite in the handling of these Machines on the old plan. All that is now required can be done *by any unskilled labourer*, who has only to push the Machine before him, the Registered Adjustment insuring a clean cut of uniform height, and preventing the knives from cutting into the soil, however uneven the ground may be. Illustrated Price Lists, with copies of Testimonials, and a Catalogue of his other Agricultural Implements, may be procured, post-paid, on application to the Manufacturer,
B. SAMUELSON, Britannia Works, Banbury, Oxon.
The above may also be procured at the principal Agricultural Implement Depôts in London, and of all respectable Ironmongers and Seedsmen in the country.

CLAYTON, SHUTTLEWORTH, AND CO.'S PRIZE PORTABLE STEAM ENGINES, AND COMBINED THRESHING, STRAW SHAKING, RIDDLING AND WINNOWING MACHINE may be seen at their London Establishment, 6, Fitzroy Terrace, New Road, where all information relative thereto can be obtained. These Machines are constructed to horn Barley, and make a perfect separation of the chaff from the pulse. They are fitted with Elevators, which deposit the grain into bags, and beyond the feeder of Machine require no hands except to take away the Corn, &c., as threshed, the whole of the operations being performed by self-acting machinery, whereby the Corn, Straw, Chaff, and Pulse are delivered in the places assigned for them.
C. S. & Co. have paid special attention to this class of Machinery, and Fixed Barn Machinery, and from the position they have taken at the Royal and all the leading Agricultural Shows of England, flatter themselves that for efficiency, durability, and simplicity, their Engines and Machines are not surpassed by any other maker in England. All letters forwarded to the Works at Lincoln will have immediate attention; and Illustrated Catalogues forwarded to all parts of the kingdom postage free.

The Agricultural Gazette.

SATURDAY, MAY 26, 1855.

THERE is probably never any case of agricultural improvement so well defined that the contrast between the past and present conditions of the land shall exhibit the influence of but one particular source of infertility apart from others. Many causes conspire no doubt to every result we see in Nature; but in most instances some one cause preponderates; and our cases may be classified according to the preponderating influences which they respectively illustrate, so as to bring out the effects respectively of climate and of soil, of drainage and manuring, and of the other means of fertility that may be enumerated.

Our first case—one of a successful compromise with climate, for that is all the farmer can accomplish—has been already referred to in our columns. Of course the individual cultivator cannot alter climate, but he can render the soil less liable to its severity and more open to what is good in it, and he can with his altered soil select crops for cultivation which shall turn the possibilities of his case to a better account than is attained by the natural vegetation of the district; and this is what has been done by Mr. FOWLER, of Princehall, in Dartmoor. This property contains about 400 acres on the granite, between Two Bridges and Ashburton, in the very centre of the moor. It was purchased by Mr. FOWLER about seven years ago in as nearly as possible its natural condition. Over most of the land there was a thin layer of peat, in some places, however, deep enough to be cut for fuel; underneath this was the decomposing granite, and above it, scattered in some places so thickly as to occupy most of the ground, were an immense number of blocks of this rock either partly imbedded or lying loose upon the surface. A very wet climate, both as regards quantity of rain and number of rainy days per annum, seemed to forbid the attempt to grow anything but the Grasses, Sedges, and Rushes which with Heather and with rocks made up the acreage of the estate. Since 1847 these rocks have been removed, piled up in enormous walls around the enclosures into which the land has been divided, forming masses 6 feet high and 6 feet wide, at a cost in some cases of 30s. to 40s. per chain in length. All the holes have been filled

up, and the land has been levelled and trenched and trench-ploughed to the depth of 12 inches, in some cases more, mingling the peaty soil with the gravelly granitic rubble of the subsoil. The land has been drained, and instead of the dead black appearance of the peat, it has now a dark brownish grey colour. Where it is under cultivation all the natural plants have disappeared, and excepting three fields, which last year were in Turnip and Rape, all the land is now laid down to Grass. In fact, the contrast between 1846 and 1854 is perfect: six years ago the whole surface was covered with stony blocks and peat holes filled with water, and the only plants were Heaths and Carices and Bents. All this has now disappeared, and in its place there is rich and luxuriant pasture in every inclosure, and the fields are covered with sheep and oxen grazing in them. As to the details of management by which this result has been obtained, we may mention that whether in trenching or trench-ploughing, care was taken to mix the decomposing granitic gravel with the peat; that the land was well cultivated and manured with guano; that in most cases, two crops of roots were taken, followed by Oats with Grass seeds; and in this Grass it will be allowed to remain as long as it produces good keep for the stock now kept on it. In September last the Clover and Italian Rye-grass sown the previous spring were being cut a third time—a very thick close crop; the red Clover in blossom, and 18 inches high, and the Italian Rye-grass 30 inches high. That one crop had kept five cows per acre for 20 weeks. The one-year, two-year, and three-year old pastures presented a thick close covering of fine Grass, and the white Clover over the whole was abundant. The following letter, just received from Mr. Fowler, describes the present condition of the land:—

"*Reclamation of Waste Land* must at the present moment be regarded as a subject of very great importance, and, I may add, one most lamentably neglected by our senators. In 1846 I purchased and in the following year took possession of about 376 acres here; the tenant was then paying about 3*s.* 6*d.* per acre rent. In April, 1847, I commenced operations, viz., draining, subsoiling, &c.; my improved land has gone through a rotation of crops, and it is now in pasture. Last Monday I had an auction here for letting part of it for grazing only until the 8th of November next. About 100 farmers attended, and the first two lots, containing 20 acres in the two fields, brought 54*l.* 10*s.*; in 1846 they were worth 3*l.* 10*s.* One of the fields was a complete quagmire when I first had it; the other mostly dry, but, lacking deep cultivation, produced very little. The other improved fields which were let had, or I may say, have little Grass in them, ewes and lambs having been over them, but the rents they brought were satisfactory. It is most shameful that Parliament should not throw without delay the waste lands into public competition on encouraging terms. The 'dog in the manger' principle should cease."

The cause of this luxuriant pasture is to be found in the perfect drainage of the land, and the intimate mixture of the peaty surface with the subsoil. We may mention that at Princetown, close by Princehall, cultivation is being carried on (similarly in spite of climate), with every promise of success, by the convicts in the prison grounds.

In the Princehall estate, then, we have an illustration of infertility under which, as it was apparently the result of climate, the owner might have been imagined helpless, yielding nevertheless to means skilfully applied at that link in the chain connecting climate with the produce of the soil, where the direction and effect of its influence may be most effectually modified; and an altered soil is made to yield an altered produce, notwithstanding that heat and light, and rain and cloud—the same duration and intensity of each—play upon it as before.

Of course many instances similar to Princehall can be adduced in Scotland and the north of England, which indeed are themselves almost throughout an illustration of the way in which climatic difficulties have been overcome. The influence of shelter as well as drainage in modifying the effects of climates are shown both on Dartmoor and on many Scottish estates. The high enclosures on Mr. Fowler's land have this effect both on the vegetable produce and on the live stock which consume it, and planting has been carried on to a great extent in many districts of Scotland with the best influence of this kind. We remember 20 years ago instances in proof of this being pointed out to us upon the Abbotsford estate: and in almost every volume of the Highland Society's Transactions illustrations of it will be found. Thus, in the last issue, January 1855, we see Mr. Stuart Mac Kenzie, of Seaforth, referring to the recently formed plantations of Fairburn in the county of Ross, specifies the shelter of the arable land in their neighbourhood as among the advantages obtained, forming as they will upon the west a long line of shelter to several farms which collectively extend beyond 1000 acres.

If the Continent contribute a steam cultivator at Carlisle, it will most probably be the one invented in 1853, by "Joseph Bauer, captain to his Majesty the Emperor of Austria's 57th Regiment of Foot, and a native of Vienna." Let us try to give a general description of this contrivance. Suppose a rectangular carriage-frame mounted upon four wheels, carrying a steam-boiler, with fly-wheels and cog-wheels on both sides, and a complicated mass of machinery underneath it. The digging apparatus is fixed not behind but beneath the middle part of the machine; the hinder carriage-wheels being set wide enough apart to travel on each side the strip of tilled ground. These are the steerage wheels; their axle being moveable like the front axle-tree of a waggon; the machine is propelled by the fore-wheels, which sustain the principal weight, and are closer together than the others, so as to run always upon hard ground immediately in advance of the diggers. We will not attempt a clear description of the mechanism by which the digging blades are actuated and the whole machine propelled, for without diagrams our words would appear only so much confusion about cams, wipers, eccentrics, oval toothed-wheels, cranks, hooks, chains, and levers. We have to do simply with the resulting action produced; it is an engineer's province to speak to the merit of the mechanical means employed in obtaining it. Under the boiler is a horizontal lever frame about 6 feet in length, having its fulcrum at the hinder end of the machine, and capable of rising and falling about 1½ feet at its other end, which is near to the front wheels. A number of spades side by side (or a single broad blade), are suspended from the free end of this frame; and can also be swung backward and forward into a slanting position as a spade is in manual digging. The motions are these—at the commencement of a stroke, the sharp, lower edges of the spades are about 3 inches above the ground; the machinery urged by the engine depresses the lever-frame, thus forcing down the spades almost vertically into the soil; the spade handles being then pulled down forwards, the spade-blades rise in a slanting position, breaking off a slice of earth the whole breadth of the work, and throwing it back some 2 or 3 feet. The frame then rising, lifts up the spades, while the machine advances for another stroke. A vibrating harrow is attached behind, so as to reduce the upper portion of the dug soil.

The inventor states that several trials made by him on diverse qualities of land gave 75 pounds as the weight required to drive a spade 1 foot broad, 1 foot deep into soil in one second of time. The cohesion of the ground, or the resistance against the slice or spit breaking loose, did not exceed (even in tough ground) 2½ ounces for every square inch included in the length and width of the slice. From these data, and taking the weight of earth to be lifted at 95 to 105 pounds per cubit foot, he estimates that a machine built for 8 feet breadth of work, 1 foot depth and 5 inches thickness of slice or spit will require 6 horse-power (effective) when making 30 strokes per minute. The machine thus advancing $5 \times 30 = 150$ inches per minute, will perform at the rate of 100 square feet per minute; or 1 acre in about seven hours and a quarter. As regards the quality of the work, the inventor says that the strips or slices are completely inverted; the lower edge of the piece falling from the spades being first to light on the ground already dug, is held up, while the upper (or stubble or sod) end drops into the trench formed by the spades. He also says, that when working very slow, the pieces remain nearly unbroken; but when the machine makes 20 or more strokes per minute, they are cast for a distance of 2 or 3 feet, and are entirely crumbled by the heavy fall.

Now, from experiments we have ourselves made, we do not believe that this complete turning of the slices can be generally effected in this manner; the pieces once free of the cutters, and left to the chances of mere *falling*, will not so regularly accommodate themselves to our wish; so that we have long ago concluded that, to be thoroughly accurate in burying every portion of the surface, *each piece that is cut must be laid by force in its required posture.* We may assure Captain Bauer that if the best he can do is to *throw* backward the strips or spits of soil cut by his blades, he must offer to accomplish a great extent of work in order to compensate us for so imperfect a performance: we cannot afford the various expences of a six or eight-horse engine upon only 1½ acre per day, unless the digging be well done—the surface weeds and rubbish buried, and the subsoil exposed more completely than this machine is calculated to do it, and at least more efficiently than by our present deep ploughing. Thinking thus lightly of the capabilities of this invention we need not add anything as to its unwieldy and intricate character, which will forbid its practical employment in the field. *I. A. C.*

ON A PROCESS FOR THE DETECTION OF CERTAIN ADULTERATIONS OF OIL-CAKE, FLOUR, AND BREAD.

By Thornton J. Herapath, of Bristol.

From statements that have been made in the Gazette and other periodicals, it would appear that the Rape and Linseed cake which are now so much used for feeding cattle are often purposely adulterated by unprincipled manufacturers with Mustard-cake; and even the less costly varieties of oilcake which are employed in this country as manures are said to be sometimes sophisticated with cheaper materials.

Having been called upon lately to examine several specimens of Rape-cake which were supposed to be adulterated with Mustard, I long experienced considerable difficulty in detecting the presence of the latter, as I found that the results afforded by the ordinary method of analysis were not in every instance perfectly satisfactory. The usual mode of examination, as is well known, consists in reducing the cake to a fine powder, and mixing it with cold water, when the presence of Mustard is supposed to be evinced by the pungent taste of the resulting solution, as well as by the lighter colour of the Mustard husk as compared with that of the Rape.* The process of analysis, however, that I was at last induced to adopt is undoubtedly much more conclusive, and will henceforth, I am satisfied, be invariably employed by agricultural chemists in investigations of this nature. It consists in treating the cake, previously broken up into small pieces, with repeated portions of boiling water, and squeezing the insoluble remainder in a linen cloth, so as to obtain the husk of the seed in a separate state, and then to act upon the latter with hot diluted nitric acid, and examine its structure under a microscope. By means of the nitric acid the starch grains, &c., are dissolved, and the husks themselves are rendered so transparent as to readily admit of their structure, and the form of their constituent cells, being observed. The form of the cells in the husks of the various oleaginous seeds is so essentially different, that a simple examination by this process will immediately convince us that a better means of detecting the adulteration of the oil-cake could not be devised. Thus, for example, the cells in the Mustard-husk are

a.—Portion of Rape-husk. *b.*—Portion of Mustard-husk. *c.*—Portion of Linseed-husk.

very small, whilst those of the Rape and Linseed husk are considerably larger, and differ from them in shape. The Mustard husk has, moreover, so to speak, a hexagonal net-work of thicker tissue, which is very characteristic, and is not observed in either of the others.

A somewhat similar method of analysis will also enable the chemist to detect the adulteration of wheaten flour with the flour of the *leguminosæ* (Beans, Peas, &c.), and of Buckwheat, and of cereals, as Rice, Barley, Oats, Rye, and Indian Corn; and also that of bread with mashed Potatoes. M. Donny has shown that the cellular matter of leguminous flour is very different in its microscopic characters to that of wheaten flour, and of the cereals generally. The mode, therefore, in which I proceed to separate this cellular matter for examination is to heat about two or three hundred grains of the suspected flour or bread in a small evaporating dish, with a sufficient quantity of dilute nitric acid, composed of about one part of ordinary nitric acid with six or seven parts of water, until the whole of the starchy and glutinous matters are dissolved; and then to collect the yellow cellular particles which float as a scum on the surface of the acid liquid, and submit them to examination by a microscope of moderately high power between two pieces of glass. A series of comparative experiments with good Wheat flour, &c., will then immediately convince the operator if any adulterating ingredient is present. When the chemist is often called upon to perform such analyses, it is advisable for him to set up several specimens of the cellular matter from the different varieties of flour, &c., in glass cells in the acid solution, so that he may always have them at hand when required for comparative examination. By this process I find one or two per cent. and even less of adulteration

* See Professor Johnston's "Instructions for the Analysis of Soils," &c., p. 90.

may be easily detected. This method of analysis possesses, moreover, the additional advantage of taking up but a short time for its completion—a matter which is often of no slight consequence to the analytical chemist. *Bristol Laboratory, May* 18.

MR. CHADWICK ON INDIAN IRRIGATION.

You have inserted an extract from the speech of Mr. Edwin Chadwick on Indian Irrigation at the Society of Arts, in which that gentleman, true to his fixed idea, recommended the substitution of underground channels, pipes, hose, jet, and I presume steam-power, for the present simple means by which at a trifling expenditure of public money, and a trifling application of native labour, the Indian cultivators manage to apply in the Godavery district the exact quantity of water required to their crops, slightly moistening the earth by repeated applications for dry grains, fruit trees, &c., and covering the land with a sheet of water many weeks in succession, where Rice is to be grown. And in apparent support of his views, Mr. Chadwick gives a table of the comparative expenses of open and underground irrigation, extracted from "Minutes of the Board of Health," which have already been widely circulated at public expense.

As regards Indian cultivation the recommendation is perfectly absurd. In less than six years the irrigation works of the Godavery, at an expense of some 200,000*l.*, have irrigated 1,200,000 acres of delta land, levelled as flat as a billiard-table. Thousands on thousands of acres grow Rice, and make the people fat where previously they starved on uncertain crops of dry grain. Let a governor-general, of Mr. Chadwick's choosing, order all irrigation works to be covered, and 60, not six, years would be needed to obtain the skilled labour for the work. When the pipes were laid they would be immediately choked. The Indian rivers most valuable for irrigation are charged with alluvial mud; they moisten and manure the land at the same time. If Colonel Cotton had "contrived a plan for filtering" and piping his irrigation works, small would have been the value of his labour. Suppose, however, the mechanical and financial difficulties overcome, and the channels for 1,000,000 acres intersected with glazed or iron pipes of the Board of Heath pattern; suppose — and it requires a very lively imagination to suppose anything of the kind—the richest Indian peasants, who never possessed 10*s.* in cash in their lives, who handle a hoe and draw water through long channels with hereditary skill, all furnished with the hose, jet, and steam-engines necessary for showering water over a dead flat; it is quite certain that except as a most expensive imitation of rain the expedient would be of no value whatever. It would not give the quantity.

I appreciate fully the value of the hose, pipe, and jet distribution of manure over newly-cut green crops, especially Rye-grass. I heard with great pleasure the candid, comprehensive, and most instructive paper on the Liquid Manure Farms of Scotland, read at our London Farmers' Club in March last by Mr. J. C. Morton. But Mr. Morton took care not to recommend the adoption of the system to other than dairy farms, and made no wholesale comparison between the cost of water meadows and hose and jet irrigation. With a garden engine I may easily water an acre or two of garden ground; but if I have a water meadow of 100 acres, with the channel of a stream running along its upper side, I have only to stop that stream until it flows over to cover my Grass with a sheet of water of the same breadth as the length of the channel; and that water will go on running without any cost for labour in pumping or handling pipes. Mr. Chadwick might just as well propose that rails and locomotives should be fitted to every parish road in England, and that all the market gardens round London should be covered with glass. As for the table of the comparative cost of water-meadows and underground irrigation, it is worth nothing as a piece of evidence. Mr. Lee, the gentleman who prepared it, gallopped through the country at railway speed, first selected the most expensive specimens of open irrigation (a process which, as I have before shown, is meant to do quite a different operation from the hose and jet); then he went to the Duke of Sutherland's, Mr. Littledale's, Neilson's, and other farms on the underground irrigation plan (an excellent plan, undoubtedly, under certain circumstances), and guessed at the expenses. At Trentham and at Liscard "the official inspector" had no data for the calculations he puts down so positively—either as to the cost of execution or the cost of working—that is shown by his report. Why, sir, in the report of Messrs. Ackland and Sturge on the agriculture of Somersetshire, you will find that certain hill side water-meadows are constructed at from 20*s.* to 30*s.* an acre; and if I wrote in the spirit of the Board of Health minutes, I might collect a table of such exceptional instances, and thence prove that under all circumstances nothing was so cheap, so profitable, and so advisable in farming as an open water-meadow!

I protest against this new plan of sending sub-inspectors and other such officials to collect evidence to support a preconceived theory, of arranging that evidence like the evidence on a lawyer's brief, and circulating it with the stamp of official authority in a form which allows of neither contradiction nor criticism. I hope to see soon in your Journal an account of the annual expense of steam driven liquid irrigation, taken from the experience of a series of years, drawn up as carefully as Mr. Morton's paper on the crop results of that plan in Scotland. *Sam. Sidney, Farmers' Club, Blackburn.*

Home Correspondence.

Dairy Statistics.—I scarcely know how to treat your criticism of my statement to the Royal Agricultural Council. It occurred to me to invite Professor Simonds or some other individual of known competency to examine on the spot my proceedings and mode of testing results. On consideration I prefer introducing a more detailed account of this at the next meeting of the Council, when the subject is again to be discussed. I adhere to the statement that the whole of the cream skimmed by the ordinary process from December up to the present has throughout yielded, with little variation, 25 oz. of butter from each quart, and I may add that this butter obtains the preference in this neighbourhood. In my experience of dairy practice I have never observed so low a produce of butter from a given quantity as the lower range instanced by you in Mr. Telford's dairy. With the attention I am giving to this matter, such a relation of milk and butter would not occur a single week without attracting my notice. *Thomas Horsfall, Burnley Hall, Otley.* [We are glad that our criticism has induced Mr. Horsfall to give in further detail the account of his dairy experience. Our remarks were not intended to convey any further doubt of the accuracy of his statement than what may be thrown upon it by the mere fact of its extraordinary nature. We believe for ourselves that his research has been persevered in long enough and that its results have been carefully enough recorded to justify confidence in his accuracy. They are nevertheless so far beyond ordinary experience that for a long time to come, and until supported by the testimony of additional experience, either on his own farm or, still better, elsewhere, Mr. Horsfall must expect dairymen to attribute them to accident or error rather than to causes which they can wield at all times as he appears to have done.]

Facts on the Food of Rooks.—In your last week's Paper your correspondent near Chelmsford asserts, when speaking of rooks, "these black-feathered gentry never feed on insects if they can procure grain." In this respect I must beg to differ from him, though I have suffered from them perhaps as much as most people. My first essay at farming on my own account was a field of Peas, at 24*s.* per bushel for seed; my idea was to get off these new Peas and sow Turnips. The experiment went on well till the Peas podded, when, as was the case with your correspondent's Barley, the rooks made an onslaught on the field and entirely destroyed them, so that I sold what had cost me about 30*l.*, in seed and manure, for 7*s.* 6*d.* My next was a piece of Potatoes, about 3 acres, planted on Mr. Johnson's plan. Well! the rooks had a few of them when planted, and all the residue soon after young tubers were as large as eggs. You will say this is no plea for the rooks; true, but it is a proof, to me at least, that it will not pay a farmer to attempt to sow when all his neighbours have their corn safe in the barn, or to attempt to ripen his crops when all the others are growing. It happened, I think, on Thursday last, just as I had been reading the paper referred to, that we had begun to "stifle-burn" a piece of land, about 6 acres, which had been lying rough since its autumn ploughing; we had collected on this small plot 13 men, 4 women, 2 boys, and 2 horses; we had no sooner begun operations than myriads of rooks came flocking to our assistance—you may easily suppose what they were after—the grubs and insects exposed by the removal of the clods and Couch. From this spot we can see no fewer than 5 rookeries, and there are 2 more within three quarters of a mile from this place; the fields immediately adjoining were (1) spring Wheat, just peeping out; (2) Oats sown yesterday; (3) Potatoes planted only a few days; (4) Vetches ditto; allotments with Potatoes and grain just being planted; and I think I should be speaking within compass if I say we could see 30 fields of grain from the same spot, and scarce a rook near them. Now, generally, the rook is a very shy bird, and I think nothing but an intense craving for this sort of food would have induced them to venture amongst such a host of persecutors as we then presented. The boys slung stones, the women halloaed, but all to no purpose—they would have their grubs, and that at a time when they might have plenty of corn without being molested. I think it would be about as well to say that a thorough true-bred old Saxon would never eat beef if he could get bread. Although we are surrounded with so many rookeries, we suffer much more from the depredations of the wood pigeons. I remember reading a leading article of your paper in the autumn of last year on Trifolium incarnatum, and I think you then stated that its only enemy was a small white slug. I sowed a piece as nearly as possible according to your recommendation; it came up and looked very promising till since the frost passed away, when all of a sudden it began to disappear, and is now nearly all gone. I had observed some wood pigeons about the field, but it did not strike me that they had the Clover, and I was just about to lay it on the back of the rabbits and hares, when I shot one of the pigeons; it seemed remarkably heavy and large; its crop was very full, and on opening it I found it entirely made up of the leaves of Trifolium. I made an attempt to count the number of young leaves, but on arriving at the number of 300 I found my heap did not much diminish, and I gave up the task as a bad job, and began to measure; I found I had just leaves enough to fill a pint cup when put loosely in; this is new to me. I had several years endeavoured in vain to get a field of Rape for the lambs in spring from the same cause, and the few Turnips that remained green this spring after the frost were very speedily stripped; and since that they have, in company with the larks, nearly destroyed all our Vetches. From this experience I have arrived at the conclusion that the pigeon is really more the farmer's enemy than the rook. *Henry Cox, Longford House, Minchinhampton.*

Small Holdings.—Any advocate of small holdings need only travel by rail to Paris to see the lamentable effects of too great a subdivision of land, even among an industrious and intelligent race such as are the northern French. I only noticed one field well covered with manure, whereas very many had simple, untrodden, untouched straw, which they were ploughing in. Very few can afford a farm steading, or have cattle to make sufficient manure, so that the straw is carried bodily from the rick to the field. I hardly noticed a single stack or rick, and this alongside of a rail established some years. So that they do not always "do things better in France." *Somerset.*

Education.—"What provision is made for the education of those intended to follow the agricultural profession?" is a question which seems certainly not out of place in these days, when so much is being said about farming and gardening. A picture might easily be drawn of the young farmer on the one hand and the gardener on the other. The former is sent to a boarding or grammar school, and learns Latin and Greek perhaps; while the latter is often obliged to rest contented with what he can pick up at a national school. It is obvious that in neither case is the youth receiving the education he requires for the highly practical art he is about to pursue. I cannot but think that it would be a great boon if there were establishments (scholastic I mean) where the science of practical agriculture could be blended with the ordinary routine of school life, so that the young farmer or gardener might be instructed for his profession before actually entering upon it. I mean nothing more than that such youths be taught when at school how to use a spade, a hoe, and rake; how to plant, tend, and rear the common vegetables and flowers; the care of cows, horses, pigs, and poultry; and that they also be made acquainted with the outlines of agricultural chemistry as applied to our gardens and farms. By these means I think much good would be done to the rising generation of small farmers and gardeners. *J. J.*

Blue Vitriol as a Steep for Wheat.—I have reason to thank your correspondents for noticing my communication on the failure of my Wheat, because it has led me to close investigation of the manner in which the vitriol was used. After a close cross-examination I found to my astonishment that the person to whom my orders were given did not attend to them, a misfortune to which those who cannot look to everything themselves are too liable. The "usual way" of dressing the Wheat here is, as I directed, to dissolve 1 lb. of blue vitriol in 2 gallons of water; either to place the Wheat in a tub or on a floor; to saturate the Wheat and dry it with lime. I find that the Wheat was wetted, and that the vitriol reduced to a powder was sprinkled over the Wheat. I really believe that this was the cause of the failure in my crop,; the seed not so dressed came up on the same soil vigorously, and is vigorous still. I ought to apologise for giving you and your correspondents so much trouble; but I think it will be an additional lesson to all who can to follow the example of Mr. Taylor, and superintend in person, as I shall do for the future, operations which, if not properly managed, may lead to disastrous results. I asked before I wrote first whether the Wheat was dressed as usual; the ready answer was—yes. *J. C. C.*

Land Drainage.—As I merely gave a brief reply to a question put by "Aged Practical Observer" on a point of some importance, viz., the persistency of a drain apt to be choked with roots, and as the subject seems worthy of some attention, permit me to enter on it a little more at length. Although I have been a practical horticulturist for 35 years, and a pretty close observer of agricultural operations all that period, yet I would take no credit to myself on that account; many a one has travelled far and wide with his eyes open, but never awake all the time; and some one has observed that experience to a person without genius is like light to the blind. I would, therefore, permit the question to rest on its own merits, and not derive any factitious aid either from my age or experience. In making these remarks I do not intend to be discourteous to your correspondent; I hope they will be taken in good part. I recollect 30 years ago, in sinking a well through red till, the diggers came to a thin seam of sand about 6 feet deep, and half an inch thick; water oozed out of this, and although the well was sunk 26 feet none else appeared. This well has never run dry since; even in '23 enough gathered to supply the family. Observe: here is a natural drain of half an inch of sand permanent and efficient. I have often observed the farmer cutting drains, in every description of soil, and so sure as the operator came on a seam of sand so certainly did he catch the water which had shelved out with the sand to the surface soil, and carry it away in his drain. So much for seams of sand being the natural drains and conductors of water where they exist. "Aged Practical Observer" cannot be acquainted with sand drainage or sand filters when he compares them to stone drains The openness of the stones permits muddy water, that is water containing fine particles of soil, to enter their interstices, and by deposition gradually choke these up and destroy the drain; this does not and cannot take

place with sand—the interstices are so small that the finest particles are arrested on its surface, and the body of sand beneath kept quite clean. The expense in some quarters no doubt would be considerable, but in many places like this abundance can be had for the cartage alone, and a cubic yard would furnish 10 or 12 yards of drain. I have heard complaints from some farmers that in certain descriptions of soil their drainage was too perfect, running off the rains so quickly that in droughts their soil was too dry. This could not be the case in sand drainage; the outpour would be slow and constant. To sum up, it remains to be proved on a considerable scale whether or not sand drainage may be advantageously substituted for the ordinary descriptions of drains; and it is exceedingly probable that in the neighbourhood of trees and other plants which insinuate their roots so pertinaceously into all open drains they shall thereby be excluded, and the continuity of a drain kept up. *J. L., M.D., Newburgh, Fife.*

Steam.—All attempts to use steam carriages on a common road have failed, the friction on the wheels being great from the roughness of the turnpike road, and its want of surface resistance to the weight of the engine, which sinks deeply into the soft material, the wheels turning round on their own ground when the steam is up. Experiments on the highway having been unsuccessful, how will they answer in the field? Steam power to be made available for tillage will, in all probability, have to call in the aid of horses, the latter to draw the machine, the former to work the grubber. The great advantage of steam would be to stir wet damp stiff soil deeply in winter or summer to benefit by the frost, air, and sun, and afterwards pulverise it thoroughly, ready for the drill. Should the first operation be accomplished how would the second be carried out? The strength required to force a heavy apparatus ever rough ground to finish it off would be enormous, if possible. So many difficulties present themselves without the assistance of a railway, which appears out of the question in small enclosures, that agriculturists should remain satisfied with making steam useful in thrashing, crushing grain, cutting chaff and Turnips, pumping water, &c. A portable engine would meet all these wants on a farm, and might be shared with neighbours by a little amicable arrangement. The subsoil plough, spade, and long steel fork, will be found, where judiciously applied, the best tools for working the land deeply and effectually. It will be said, how can a large holding be cultivated by manual labour? The answer is, it is not necessary or advisable to dig or fork the whole of the arable portion of a farm; depending upon the acreage, it may be divided into either a fifth, seventh, or tenth part, to be turned up with the fork and spade annually during the idle months in the winter, when hands are plentiful and labour scarce. Again, it may be said the expense is an obstacle. The system will pay itself the second year; and in after seasons the gain, if the soil has been fairly broken up, will be great, and compensate the tenant for money laid out. The influence of the atmosphere on the land is well known: can it then be doubted how immense the advantage must be of exposing 14 inches instead of 6 to be acted upon? *Falcon.*

Fowler's Steam Plough.—The above plough is now at work in one of the midland counties, on the new red sandstone. With regard to the plough, I saw it at the Exhibition, but it was then an infant, and had many imperfections (so I thought at the time, and so they turned out to be); but it is a giant now, and at draining is perfect. It is at work on a farm yielding miserable crops (6 bushels of Wheat per acre) [?] and the landlord is draining the land against the tenant's will. The land is undulating, and faces the north, so that the fall of the land, and the slip of the soil are the same way. The first field done lay rather bad for the drains, many had to be put in by hand, and many, or most of those done by the plough in this field would be catch drains, 9 yards apart; the next field lies well for work, and the plough did its part well. Nearly all the holes that were dug to put in fresh lengths of pipes, had water standing in them from 8 to 12 inches deep, and within about 30 inches of the surface, on the 7th of May, and after the very long dry time we have had. Who could farm such land in such a state? *A Visitor.*

Societies.

ROYAL AGRICULTURAL OF ENGLAND.

Audit of Accounts, *May* 18.—Mr. Raymond Barker, Chairman of the Finance Committee; and Mr. Knight, Mr. George Raymond Barker, and Mr. Dyer, Auditors on the part of the Society, examined, audited, and certified as correct the accounts for the half-year ending December 30, 1854.

Special Council, *May* 18.—Mr. Raymond Barker, V.P., in the chair. On the motion of Mr. Milward, seconded by Mr. Fisher Hobbs, the report to be made by the Council to the ensuing General Meeting of the Society was taken into consideration and agreed to.

General Meeting, *May* 22.—Mr. Miles, M.P., President, in the Chair.

On the motion of Colonel Challoner, seconded by Mr. Raymond Barker, Lord Portman was unanimously elected President of the Society for the year ensuing the rising of the Carlisle meeting in July next.

The Trustees and Vice-President were re-elected for the year, and Mr. Dyke Acland, Lord Feversham, Mr. Mainwaring Paine, Mr. Allen Ransome, and Mr. Burch Western, new members of Council for the two years, ensuing the Carlisle Meeting.

The Secretary read the following Report from the Council:

REPORT.

Since the last half-yearly meeting in December, the Society has lost, by death and otherwise, 227 of its members, and has gained by election 132 new members. The Council, on the recommendation of the finance committee, have also removed from the list of the Society the names of 285 members who have made no payment during the last seven years. They have unanimously elected Dr. Edward Hartstein, Professor of Agriculture in the Royal Academy of Poppelsdorf, an honorary member of the Society. The Society accordingly now consists of—

89 Life Governors,
141 Annual Governors,
795 Life Members,
3838 Annual Members, and
19 Honorary Members

making a total of 4882 names on its list at the present date. The funded property of the Society stands at 9264*l.* 8*s.* 11*d.* in the stock, which has now become the new Three per Cents.; the current cash-balance in the hands of the bankers being 3225*l.*, which includes 1400*l.* as a contribution from the authorities of Carlisle towards the expenses of the country meeting of this year. Since the date in November last when the Council ordered the sale of 1500*l.* from the invested capital, the following payments have been received:—

Arrears of subscription	£1677
Current subscriptions	1847
Life compositions	389
	£3913

while every claim against the Society has been duly discharged. The continued indisposition of Mr. Pusey, and the consequent suspension of his long and invaluable labours to the Society as the Chairman of the Journal Committee, have rendered some temporary arrangements in that department necessary. The Council have accordingly requested Mr. Thompson to act as the Chairman, and Mr. Wren Hoskyns and Mr. Dyke Acland as Vice Chairmen, of the Journal Committee. The new number is now in progress, and will be published on the 1st of July. Prizes have been awarded to reports on the Farming of Buckinghamshire and Warwickshire, and also to essays on the causes of Fertility and Barrenness in Soils, and Lameness in Sheep and Lambs: a paper in the latter class has been disqualified, on account of its delivery not having been made by the 1st of March; and the prize in the class of Mildew in Wheat withheld, in consequence of the want of sufficient merit in the competing essays; while adjudications have still to be reported in the five remaining classes. The following subjects for the Essays of next year have already been adopted:—

1. Farming of Bedfordshire.
2. On the Production of Turnips possessing good keeping qualities.
3. Spring-feed Crops: with special reference to early growth.
4. The different mechanical modes of deepening the Staple Soil, in order to give it the full benefit of atmospheric influence.
5. The Chemical results superinduced in newly-deepened soil by atmospheric action.
6. The construction and maintenance of Farm Roads: with special reference to clay lands.
7. The Roots of the Wheat Plant: the history of their growth and development.
8. Essay and Plans for the construction of Labourers' Cottages: with special reference to domestic convenience.
9. Account of the different modes of bringing Moorland into cultivation, based on practical experience; and specifying the methods pursued, the expense incurred, and the results as far as ascertained, regard being had to the subsoil, locality, and elevation.

Two distinct and improtant investigations are in progress by the Consulting Chemist of the Society, namely—1. On the chemical effects of the atmosphere on the soil and vegetation; 2. On the value to the farmer of different substances sold to him for manuring purposes. Professor Way has already, in the course of this session, delivered before the members two lectures: the first, On the relation between the atmosphere and agriculture: and the second, On the chemical principles involved in the production of butter: for which he has received the cordial thanks of the Council. He also consented to deliver a lecture on the 13th of June, On the use of fish as manure; and Professor Simonds, as the Veterinary Inspector of the Society, has expressed his willingness to elucidate before the members, at a Weekly Council in the course of next month, the physiological conditions affecting the quantity and quality of milk secreted by the cow under different circumstances of feeding and management. The Governors of the Royal Veterinary College have made a most satisfactory report to the Council of the successful manner in which the special objects of the Society in reference to domesticated animals have been carried out in that establishment under the inspection of Professor Simonds. The programme of the Country Meeting, to be held in the city of Carlisle, in the week commencing Monday the 23d of July next, has just been issued, and the arrangements are nearly completed. At this meeting, so favourably situated in reference to the south of Scotland and the north of Ireland, additional prizes are offered for reaping machines and steam cultivators, as well as for Scotch and Galloway cattle, Cheviot and Herdwick sheep, and for Clydesdale and other horses. The entries for implements closed on the 1st inst.; and though the number is not equal to that of either of the last two years, it has been ascertained that the covered shedding, 20 feet wide, engaged by exhibitors in that department, will extend to very nearly three-quarters of a mile in length. The entries for live stock, which will not close till the 1st of June, are already numerous. The Council have again to acknowledge the liberality and ready co-operation of the railway companies, in promoting the objects of the Society in the transit of live stock and implements to the Country Meeting. The principal companies have already signified their consent to a renewal of their concessions of last year, in favour of the exhibitors at the Carlisle Meeting. The Council have decided to hold the Country Meeting of 1856 in the district comprising the counties of Bedford, Buckingham, Cambridge, Essex, Hertford, and Huntingdon, at Chelmsford, the county town of Essex. They have also determined that the Country Meeting shall be held, four years hence, in the Central District, which will comprise the counties of Oxford, Warwick, Northampton and Berks: and thus, after a circuit of 20 years, the Society will return to that part of the kingdom in which at the city of Oxford, under the most favourable circumstances, it held its first meeting. The Council have viewed with much interest the progress of measures adopted by the Government of France to stimulate and improve its agriculture. At the request of the French and English Foreign Departments, for Council have taken every means to make known in this country the inducements held out and the facilities afforded to the exhibitors of the United Kingdom, at the agricultural meeting to be held next month in Paris; and they have decided that six of their members shall form a deputation, to be present on that occasion. The Council trust that this international gathering will be attended with the most favourable results to the agriculture as well as to the cordial understanding now so happily subsisting between the two nations. The Council have continued to be favoured by the Earl of Clarendon with copies of successive despatches received at the Foreign Office from her Majesty's Ministers and Consuls abroad, reporting the result of their inquiries and researches connected with the occurrence of guano or the nitrates in tropical districts. Some of these communications have been of an important character, and have referred to discoveries of extensive deposits of those valuable manures, as well as to the occurrence of an unlimited supply of native carbonate of soda in South America. His lordship has coveyed to the Council an assurance that whatever facilities or privileges are granted to other countries by the Governments within whose territories these newly-discovered deposits occur, will be claimed by her Majesty's Government on behalf of the agricultural and commercial communities of the United Kingdom.

By order of the Council, James Hudson, Secretary.

This Report was unanimously adopted by the meeting.

Mr. Raymond Barker, chairman of the Finance Committee, having read the auditors' balance-sheet, the best thanks of the meeting were voted to the auditors for their care in auditing the Society's accounts; when Mr. Knight, on the part of himself and his colleagues, acknowledged the compliment, taking that opportunity of bearing testimony to the clear, simple, and exact manner in which the accounts of the Society were kept.

On the motion of Lord Feversham, seconded by Mr. Druce, the cordial thanks of the meeting were expressed to the President for the great services he had through so long a period and on so many occasions rendered to the Society. Mr. Miles acknowledged that expression of the friendly sentiments of the members towards him, and hoped that they would one and all endeavour to be present with him at the Carlisle Meeting in July.

Notices of Books.

Professor Johnston's Instructions for the Analysis of Soils, &c. Third edition. Blackwood & Son.

No one has had a larger experience than Professor Johnston, whether as an agricultural chemist or as teacher of agricultural chemistry. His instructions are of the greater value on this account; and the agricultural student will find in this little volume a guide to this department of his studies as explicit and trustworthy as could be desired.

The Journal of the Bath and West of England Society.—The table of contents of this issue of the journal is as various and instructive as ever, with as much on the general subject of agriculture combined with its special adaptation to the district of the society, to secure for the work a general as well as a local circulation. We have already made some extracts from its pages, and have other articles in type, of which our readers shall have the benefit as soon as possible.

We observe that Mr. Acland, to whom the renovated character of this society is so much due, acts now as one of the Journal Committee of the English Agricultural Society during the lamented illness of Mr. Pusey.

Miscellaneous.

The New Markets, Copenhagen Fields, were to have been opened on June 1; H. R. H. Prince Albert has, however, signified his intention of being present at the opening ceremony, and that has, therefore, been postponed to suit his convenience. Everything is now ready for the permanent use of the new market.

Calendar of Operations.

MAY.

Berwickshire Mere Farm, *May* 21.—After a long period of cold, drying east winds, we had a regular wet day on Wednesday, the 10th inst., which put a stop to our fallow work for that week. The wind, however, soon dried the land, and operations were resumed last Monday. The three past days have been fine, mild, and growing, but to-day our old enemy, that "eternal" Nor'-easter has returned in full force and as cold as ever. The Wheat plant is strong and healthy, as is generally observed in a dry spring, indeed late sown spring Wheat has grown faster than the Barley, which looks very "blae" after the late frosty nights. Oats have all along reaped the benefit of a fine seed bed. Beans and Peas are up. Potatoes having been sound last year, though but a middling crop, a considerable breadth (for this district) has been planted in the end of last month. Winter Tares look very poor indeed, and will not be ready when most wanted—before "seeds" afford a cutting. The latter crop is well planted and green; but we cannot expect to cut any for three weeks at least. Young Grass having been full stocked at an early date, the Clovers have suffered much from the nightly hoar frosts: in many places it looks no better than bare stubble. Old pastures, being closer in the bottom, have stood the drought better. Lambs are a middling crop, but have done well. Fat hogs require an allowance of cake and Beans to keep them in condition. Want of keep has overstocked the fat markets with clipped hogs, and caused a languor in the mutton trade; lean and half fat are almost unsaleable. Owing to the remote prospect of Grass for horses and cattle, the price of hay, which fell greatly after the storm, has again reached its former high figure: and the fortunate few, who happen to possess any of it, have been enabled to secure grazing cattle at a very moderate price, which is more than could be done for some time past. A portion of Swedes have been sown last week in good order; but of course they are doing no good in this cold weather. Light land works beautifully; but clays, previously reduced, were considerably run together by the rain of the 10th, which has caused much additional labour. Stackyards are all but cleared out; and the local demand consequently better than that for metropolitan markets. *J. T.*

Border of the Fens, *May* 21.—The present spring will be memorable for four months of continued frost and north-easterly winds, not gentle breezes but mighty storms which on more than one occasion darkened the air with the dusty fen soil, filled the dikes, and drifted it in heaps like snow, laying bare the roots of corn, and sometimes lifting them, seed and roots, from one field or part of a field, to another; therefore, although dry weather is seldom injurious to Wheat, yet the absence of rain for so long a time has prevented the Wheat plant on light soils getting firmly established, and a great deal has been ploughed up: much of what remains is exceedingly thin, and there must occur a combination of unusually favourable circumstances to make the Fen Wheats turn out a productive crop. On the 17th ult. a pleasing change took place in the weather; south winds and fine showers have already had a most beneficial effect, in which the pastures have largely partaken, and though late in growth it is probable that the food for stock may soon be plentiful, and once more relieve our anxiety on that score. Hoeing is usually the great business of the month of May, and is an operation which most people deem necessary, but from this creed there are some dissentients, persons who argue that it lessens the yield of corn, and they contend that

hand-weeding is greatly preferable, inasmuch as hoeing cuts so many of the horizontal fibres of the roots of Wheat as to check its growth and do mischief: now there may be some soils to which this argument may apply, but our practice differs so much from this theory that we have had a horse-hoe at work over all our Wheat, Barley, and Oats, and we have an impression that the horse-hoe acts better than the hand-hoe by not dividing the roots, merely moving them, but moving them so regularly and thoroughly as to admit air and light and warmth to the roots, moulding up the plant and strengthening it. It is truly beautiful to see the horse-hoe well worked, and it is much easier afterwards to weed the crop where weeding is required, and although some folks are so lucky as to have few weeds, yet we regard weeds as inevitable when much manure is employed. When the land is in good condition, the seed blown from a foul neighbour is sometimes sufficient to find occupation for a gang; clean farming is essential, but with good liberal treatment is not quite so easy as some folks would make you believe; for instance, what a pest is Chickweed among Clover, and how hard to eradicate? Sow-thistles in the Fens are a great plague, and cannot be always guarded against; Twitch and Hariff may be reduced to a narrow compass by care and labour, but inattention for a short time will spread them beyond control. The dry weather has been very useful for cleaning land, and everywhere great activity has been manifested. Twitch is inquired for to make paper, and if the process should succeed we may expect shortly to see a prize essay on its cultivation; or, perhaps, when it is known to be a profitable "crop," those who now exhibit its rank growth among their Wheat will then be less careful to preserve it than at present. Potatoes, Carrots, and Mangolds have been got in well this year, and they may be expected to succeed well. The blossom of the fruit trees is late but abundant, and surely these sharp nights of 10° and 12° below freezing will terminate shortly, then welcome "a warm June to put all things in tune." *J. W., Peterborough.*

South Devon, *May* 21.—Although now in the middle of the month of May the late cold winds and scarcity of rain have given to vegetation an appearance quite unnatural to the season of the year. For the last fortnight, however, we have been favoured with an abundance of rain, but the good it does is considerably lessened by the frequent frosty nights: this and the extreme scarcity of keep for cattle, which causes the Grass lands to be overstocked, is a sufficient reason for the want of luxuriance in our pastures. The very cold weather, so unfavourable to vegetation, proved, however, in other respects a boon to the agriculturist, as it enabled him to get in all his spring corn in good time as well as in good order, generally speaking. The Mangold crop was also finished sowing before the rain set in, so we may this season expect the young plants to come up well and regular. In speaking of the general appearance of the crops we may state that the Wheat crop has suffered much in many places from the severe weather, and particularly in exposed land looks thin. Barley and Oats came up well, but were checked by the cold winds; they have, however, improved much by the late rains, and only now require a little warm weather. In farming operations the preparation of land for Turnips is now the main feature, and progresses satisfactorily. The scarcity of keep for cattle is much felt in this part of the country, and has been the cause of the enormous prices given for Grass land this season. Much corn has also been consumed by cattle since the roots were finished. Our orchards now begin to present a gay appearance, and, from the blossom on the trees lead one to hope favourably of the crop. Prices of agricultural produce keep well up, and may be quoted as follows:—Beef, 60*s.* to 63*s.* per cwt.; sheep in their wool, 7½*d.* to 8*d.* per lb.; lambs, 8*d.* per lb.; Wheat, 80*s.* per qr.; Barley, 34*s.* per qr.; Oats, 28*s.* per qr.; yolk wool, 8½*d.* per lb.

Wester Ross, *May* 15.—A colder or more backward season the oldest farmer scarcely remembers to have seen. It is now well nigh six months since this peculiarly adverse weather commenced: and since then we have had, first, a redundancy of wet, then a continuation and intensity of frost, and now a continuation of cold easterly winds quite uncommon and alarming. Wheat looks as if it had lost all hopes of getting forward, and had turned brown in despair; yet, in well drained fields it looks pretty thick, and, I doubt not, were it coaxed by the return of genial weather it might yet reach something respectable. In ill-drained fields it looks thin, and must necessarily be light in harvest. Lack of Grass is a general complaint. Our anxiety to give over as many Turnips as possible to be eaten off by sheep often leads us into the error of reserving too few for our cattle, and the consequence is that, in such a year as this, our stock is put by far too early to Grass, and find themselves all too speedily on miserably stinted rations. We have now had a few weeks of dry weather, and out-door labour has advanced satisfactorily, and now, on the earlier farms, work is about as far forward as in ordinary seasons. In the later districts labour and vegetation are far behind. On this farm Oat-sowing was concluded on the 26th of March; Barley-sowing, 21st of April; and Potato-planting about a week thereafter. Nearly the whole of the remaining Potatoes in the north have been planted, so the Highlander, much against his will, must bid them farewell for a few mouths. We have now been for the last fortnight engaged preparing ground for Turnips, for accomplishing which the weather has been very favourable. Mangold Wurzel is scarcely grown in the north. It has been repeatedly tried, but the result has not been such as to lead to its general cultivation. Sowing of Swedes will be commenced in a few days. This kind of Turnip is now a general favourite, and is now largely cultivated. About this season the farmer selects his supply of supplemental manure, and having formerly got rapped over the fingers for meddling with stuffs which though highly puffed he knew nothing of, he has now grown wonderfully wary, and will scarcely buy anything but what has been proved, and found not wanting. We feel ourselves not a little indebted to the *Agricultural Gazette* for its manly exposure of some of those manures with high-sounding titles, and with little else to boast of. The competition amongst purchasers at our Muir of Ord markets this season has not been so great as at some of our last year's markets; but it is an easy matter to get rid of stock, in fair condition, at very high prices. Horses are very scarce, and uncommonly dear.

Notices to Correspondents.

Fertility and Barrenness: *W Barnes.* Mr. Coleman's essay will probably be published with the next issue of the Royal Agricultural Society's Journal.

Guano: *K H.* Four cwts. per acre, with a load of ashes, is a full dose per acre. Its usefulness depends on your having rain enough. You had better sow it broad-cast over the land *before* ploughing it for the Turnip drill. That will mix up the manure well and sufficiently.

Limestone: *J Kirsopp.* Limestone can be burnt with wood or peat either alone or mixed with coal. Will any one describe the best way to make a sow kiln—that is, one built in a temporary way each time it is filled.

Nitrate of Soda: *R V* We would mix nitrate of soda with wool in your inland county with greater confidence than elsewhere. It may be applied with good effect for Beans; and for a rapid growth, such as that of Rhubarb, we imagine that it and guano applied at frequent intervals in the liquid way would be the best plan to adopt.

Roofs: *H W.* We do not know the present condition of the roof you allude to. We know of one roof on a lunatic asylum near Tetbury, Gloucester, in which paper over cement was successfully employed.

Manure: *J B.* You may get rid of the smell by strewing fresh mould dust over the floor; and possibly by flinging some powdered gypsum powder about.

Grass: *S P.* The Green Globe and the old-fashioned Green are originally identical. But the Green Globes of different seedsmen differ according to the attention paid in selection for seed.

WARNER'S IMPROVED LIQUID MANURE, OR GENERAL PORTABLE PUMP.

The valve is a ball of imperishable material, and cannot clog in action. The barrel is of galvanised iron, not likely to corrode, and can be raised or lowered at pleasure. The legs will fold together, and the whole may be carried on shoulder to any pond or tank required.

Price of 4½ in. Pump, with legs, 3*l.* 3*s.* The barrel is 27½ in. long, and the legs are 5 ft. high.

1½ inch Gutta Percha Suction Pipe 1*s.* 6*d.* per foot.

1½ inch Flexible Rubber and Canvas Suction Pipe, 3*s.* 6*d.* per foot.

May be obtained of any Ironmonger or Plumber in town or country, at the above prices, or of the Patentees and Manufacturers, John Warner & Sons, 8, Crescent, Jewin Street, London.

Every description of Machinery for Raising Water, by means of Wheels, Rams, Deep Well Pumps, &c.; also Fire and Garden Engines, &c.—Engravings sent on application.

WARNER'S PATENT VIBRATING STANDARD PUMPS.

PATENT CAST-IRON PUMPS, for the use of Farms, Cottages, Manure Tanks, and Wells of a depth not exceeding 30 feet.

Diameter of Barrel	Length of Barrel, under nose.		£	s.	d.
2½ in.	short 1 ft. 7 in.	Fitted for lead,	1	12	0
2½ „	long 3 „ 3 „	gutta percha,	1	15	0
3 „	ditto 3 „ 6 „	or cast iron	2	12	0
3½ „	ditto 3 „ 6 „	flanged pipe,	2	18	0
4 „	ditto 3 „ 6 „	as required.	3	5	0
2½ „	short, with 15 feet of Lead Pipe attached, and Bolts and Nuts ready for fixing		2	12	0
2½ in.	long ditto	ditto ditto	2	15	0

The short barrel Pump is very convenient for fixing in situations of limited height and space, for the supply of coppers and sinks in Wash-houses with soft water from underground tanks, or in Hot, Forcing, and Plant Houses; they may be fixed, when desired, under the stage.

May be obtained of any Ironmonger or Plumber in Town or Country, at the above prices, or of the Patentees and Manufacturers, JOHN WARNER AND SONS, 8, Crescent, Jewin Street, London.

Every description of Machinery for Raising Water, by means of Wheels, Rams, Deep Well Pumps, &c.; also Fire and Garden Engines, &c. &c.—Engravings sent on application.

JOHN WARNER AND SONS, Crescent, Jewin Street, London.
GALVANISED IRON TUB GARDEN ENGINE,
With Warner's Registered Spreader,

is strongly recommended, for durability and low price, viz., 2*l.* 19*s.*, to hold 10 gallons.

Larger sizes in wood or iron, viz., 14 gals., 24 gals., & 35 gals. May be obtained of any Ironmonger or Plumber in town or country, or of the Patentees and Manufacturers, as also Machinery of all kinds for raising Water from any depth to any height by Steam, Horse, or Manual Power. Prices sent on application. Syringes of various constructions and sizes from 9*s.* upwards. Metallic String from 5*d.* to 1*s.* 3*d.* per lb.

JOHN WARNER AND SONS, 8, Jewin Crescent, London, Manufacturers of FIRE ENGINES, PUMPS, GARDEN ENGINES, and SYRINGES.

Brass Syringes, 9*s.* to 18*s.*

All articles of John Warner & Sons' manufacture may be obtained of any Ironmonger or Plumber in town or country, at the advertised prices.

John Warner & Sons having been practical Horticulturists for many years, know exactly the requirements of both Amateurs and Gardeners. A gardener with a properly constructed pump will get through as much work in five minutes as he could with any Syringe in a quarter of an hour, and with half the labour to himself. Syringes are economical for small houses.

No establishment offers such a variety of effective machines for hydraulic purposes, whether to supply Gardens, Hothouses, Cottages, Farms, Mansions, or Boards of Health, with every requisite connected with the conveyance and distribution of liquids.

Fountains suitable for Conservatories, Lawns, &c.

Sheets of Engravings sent on application.

PRIZE MEDAL—1851.
AT A VERY ECONOMICAL RATE.

SAMUEL CUNDY, Mason and Builder, Pimlico Marble and Stone Works, Belgrave Wharf, Lower Belgrave Place, Pimlico, London.

Marble Chimney-pieces manufactured by improved machinery. The public are invited to view the stock, unequalled for quality and price. A good Marble Chimney-piece for 40*s.* Marble Work in all its branches at a remarkably cheap rate for Halls, Dairies, Larders, &c. Circulars sent on application.

N.B. The "Royal Blue" Omnibuses pass the Works every ten minutes from the Bank.

WARNER'S SWING WATER-BARROW is intended for all large Establishments where much watering is done by the watering-pot. By its use much time and labour of the Gardener are saved, particularly where the Tank, Pond, or Pump, is at a distance from the garden. May be obtained of any Ironmonger in town or country for 3*l.* 3*s.*

Manufactured by
John Warner & Sons, 8, Crescent, Jewin Street, London.

(Fig. 1.) (Fig. 2.)

No. 12 „	24 „	„	45	„	...	5	0
No. 14 „	30 „	„	45	„	...	5	18

A large assortment of every description of Garden Syringes, Pail Engines, Conservatory Pumps, &c., kept in Stock.

No. 1, Plain Syringe, with rose and jet, diameter of barrel, 1½ inch, 14*s.* 3*d.*; No. 2, do., diameter of barrel, 1⅝ inch, 12*s.*; No. 3, do., diameter of barrel, 1⅜ inch, 10*s.* 6*d.*

Read's Syringe, with two roses and one jet, 19*s.*

J. Tylor & Son's Horticultural Apparatus may be obtained at these prices from any respectable Ironmonger or Seedsman in town or country, through whom alone they will be supplied, and of whom Drawings and Prices may be had.

N.B. Cost of carriage, &c., not included in these prices.

J. Tylor & Son's Manufactory, Warwick Lane, Newgate Street, London.

J. TYLOR AND SON'S REGISTERED GARDEN SYRINGE.—Small size, for Amateur use, **21s.** each Large size, for Gardeners' use, **25s.** each.

Extra for Telescope Tube as shown in engraving for watering plants on stands at a height of 8 feet, so that any quantity of water can be deposited in the pot without wetting the leaves, 10*s.*

By a simple arrangement this Syringe is rendered more effective than any portable Conservatory or Garden Pump ever offered to the public. It is equally adapted for Garden or Conservatory use, and is capable of discharging twice as much water in a given time as any other Syringe now in use. The arrangement consists in attaching a small flexible suction tube to the barrel of the Syringe, through which it is filled with water at every discharge of the previous contents. By this means the Syringe is always charged, and the pull-up stroke of the piston rendered perfectly easy, it having, indeed, no work to do, the barrel being previously full of water. Being thus made self-supplying, a great saving of labour is effected; and the necessity of stooping to fill the syringe at every discharge being done away with, the direction of the water can be maintained for any length of time. It is perfectly cleanly in its action, as it is not possible for any water to get on the outside of the barrel, which is a well-known inconvenience attendant on the use of every other Syringe. Its construction is perfectly simple, and cannot get out of order; the ground in ball valves and fittings used for filling all other patent Syringes being entirely superseded. To be had of any respectable Ironmonger or Seedsman in town or country.

J. Tylor & Sons, Manufacturers of Horticultural Apparatus Warwick Lane, Newgate Street, London.

N.B. These prices do not include carriage, package, or expenses of delivery in the country.

RICHMOND & CHANDLER'S PATENT CHAFF-CUTTING MACHINE.

All the various modern Implements of Agriculture manufactured on the most scientific and improved principles, suitable for home use and exportation.—Address, Richmond & Chandler, Salford, Manchester; and 32, South John Street, Liverpool.

London Agency:—The Manager of the Agricultural Department, Baker Street Bazaar.

FOUNTAINS, BASINS, VASES, STATUES, FLOWER TRAYS, &c. in TERRA COTTA, by J. M. Blashfield, Praed Street, Paddington.

GARDEN VASES, FOUNTAINS, ETC.

THOMAS SOMMERVILLE, Landscape Gardener, Nurseryman, Seedsman, and Florist, Garden Road, St. John's Wood, London, begs respectfully to inform the nobility gentry, and his patrons generally, that he has entered into arrangements with an eminent company in Scotland for the sole disposal in London of their highly ornamental and very durable Vases, Fountains, &c., samples of which may be seen at his grounds in the Garden Road, as above.

T. S. has much pleasure in being the first to introduce to the notice of the public a highly ornamental Vase, capable of resisting the most severe weather, and at little more than half the cost of any other possessing the same qualities; and he has no hesitation in stating that a more suitable Vase for the growth of plants cannot be manufactured.

HORTICULTURAL WORKS AND HOT-WATER APPARATUS MANUFACTORY,

Kensal Green, Harrow Road, London.

JOHN TAYLOR AND SON beg to call the attention of the nobility and gentry to the very superior manner in which they Erect all kinds of Conservatories, Vineries, Greenhouses, &c., combining every improvement with elegance of design, and durability of materials and workmanship.

Their VENTILATING APPARATUS for the Fronts and Roofs of Houses has given the highest satisfaction. Churches, Chapels, Schools, Entrance Halls, Public Buildings, &c., heated with Hot-Water Apparatus in a most economical and efficient manner. J. T. & Son have great pleasure in referring to numbers of the nobility and gentry by whom they are extensively engaged.

HORTICULTURE IN ALL ITS BRANCHES.

JOHN WEEKS & Co., King's Road, Chelsea.

HOTHOUSE BUILDERS.

THE NOBILITY AND GENTRY about to erect Horticultural Buildings, or fix Hot-water Apparatus, will find at our Horticultural Establishment and Hothouse Works, King's Road, Chelsea, an extensive variety of Hothouses, Greenhouses, Conservatories, Pits, &c., erected, and in full operation, combining all modern improvements, so that a lady or gentleman can select the description of House best adapted for every required purpose.

The HOT-WATER APPARATUS, which passes through all the Houses and Pits, affording both top and bottom heat, is in constant operation and particularly worthy of attention.

Many of the Houses and Pits are of wide and lofty dimensions and together equal in length 1000 feet. They are all effectually heated by *one boiler*, which, during the severe winter months does not cost in labour and fuel more than 3*s.* 8*d.* per day, and the apparatus is so arranged that each House or Pit may be heated separately and to the required temperature. The splendid collections of Stove and Greenhouse Plants are also in the highest state of cultivation, and for sale at very low prices. Also a fine collection of strong Grape Vines in pots, from eyes, all the best sorts.

Plans, Models, and Estimates of Horticultural Buildings; also Catalogues of Plants, Vines, Seeds, &c., forwarded on application to John Weeks & Co., King's Road, Chelsea, London.

GALVANISED WIRE GAME NETTING.—7*d.* per Yard, 2 Feet Wide.

		Galvanised.	Japanned iron.
2-inch mesh, light, 24 inches wide	...	7*d.* per yd.	5½*d.* per yd.
2-inch „ strong „	...	9 „	6¾ „

1⅝-inch „ light „	...	8 „	6 „
1⅝-inch „ strong „	...	10 „	8 „
1⅝-inch „ extra strong „	...	14 „	11 „

All the above can be made any width at proportionate prices. If the upper half is a coarse mesh, it will reduce the prices one-fourth. Galvanised Sparrow-proof Netting for Pheasantries, 8*d.* per square foot. Patterns forwarded post free.

Manufactured by Barnard & Bishop, Market Place, Norwich, and delivered free of expense in London, Peterborough, Hull, or Newcastle.

IMPROVED MOWING AND ROLLING MACHINE

ALEXANDER SHANKS AND SON, Arbroath, Forfarshire, Inventors and Sole Manufacturers, respectfully solicit the attention of the Nobility, Gentry, and Gardeners to this Improved Machine for Mowing and Rolling Lawns. The Machine is in operation in the Royal Gardens at Windsor, Palace, Buckingham Palace, and at Osborne, in the Royal Gardens at Kew, Regent's Park, Manchester, Sheffield, &c. at Blenheim Palace, Trentham, Cleveden, Elvaston, Broadlands, Woburn Abbey, Clumber, Lilleshall, Castle Howard, Shrubland, Eridge Castle, Enville Hall, Tiptree Hall, Chatsworth, and in many other of the principal gardens in the kingdom as well as in the United States, British America, and on the Continent, where its merits have been fully proved, and its success established.

The machine is made to cut the breadth of 42, 30, 21 and 15 inches respectively, is exceedingly durable, easily managed and adjusted to cut to the length required. The execution of the work is far superior to what may be attained by the most skilful mower, while at the same time a great saving of labour is effected, and the turf much improved. By the largest machine a Scotch acre may be mowed, rolled, and the Grass collected in one hour.

A. S. and Son have much pleasure in stating that they have made considerable improvements in their 15-inch or hand machine this year, by which the draught is considerably lessened. This machine combines all the merits and advantages of the larger machines with firm and secure construction, and is admirably adapted for borders and for lawns of no great extent.

Alexander Shanks and Son also respectfully solicit notice to "Fleming's Weeding or Salting Machine" for destroying weeds in gravel walks, court-yards, drives, &c. This machine is now in operation in many parts of England, where it has given ample satisfaction as the best and most economical means of thoroughly keeping down weeds or Moss.

Further particulars, with testimonials and prices, may be had on application.

HOSE PIPING.

TO ENGINEERS, AGRICULTURISTS, GARDENERS, SHIP CHANDLERS, AND FIRE BRIGADES.

WAITHMAN'S PATENT FLAX TUBING (1½ to 3 inches in diameter) will sustain a greater pressure, is lighter, less bulky, will wear longer, and is about 60 per cent. cheaper than the leather hose pipe. Manufactured only by Waithman & Co., Bentham, Lancaster.

PRICES IN DIAMETER AND PRICE PER YARD.—½, 11*d.*; ¾, 1*s.* 3*d.*; 1, 1*s.* 7*d.*; 1¼, 1*s.* 9*d.*; 2, 2*s.*; 2½, 2*s.* 3*d.*; 3, 2*s.* 9*d.*

Testimonial from Mr. Wright, Lancaster.—I beg to inform you that I yesterday tested your piece of 2½ inch Patent Flax Tubing, connected with the Lancaster Waterworks, in the presence of the Mayor, Mr. Rawlinson, Government Inspector, Professor Clapham, &c. The column of water at which the tubing was tried was equal to 340 feet in height, or about 150 lbs. on the square inch, and I have pleasure in stating that the hose sustained this pressure most admirably.

Testimonial of Captain Martin, of the Great Britain Steam Ship.—Liverpool, I take pleasure in being able to tell you that your hose, supplied to the Great Britain and other ships, is well worth the attention of shipowners. It gives us great satisfaction.

Testimonial from Fairbairn & Co., of Leeds.—We have tested your hose, 2½ inch in diameter, with the pressure of the Leeds Waterworks, and found it highly satisfactory.

FOR WATERING GARDENS.

HANCOCK'S IMPROVED VULCANISED INDIA-RUBBER HOSE AND TUBING is now manufactured especially for the above purpose; is of greater flexibility than any other description of Hose: is capable of resisting great pressure, and made suitable for attaching to the mains of water-works, or to tanks of high elevations.

WATERING HOSE fitted up with the necessary *brass joints, stop-cocks, branches,* and *sprinklers complete.*

VULCANISED INDIA-RUBBER SUCTION PIPES, made any length or size for Pumps or Garden Engines.

VULCANISED RUBBER WASHERS, and also in Sheet, any thickness, for all kinds of steam and water joints, or made any size or figure to order.

All communications and orders punctually attended to, addressed to the Manufactory, JAS. LYNE HANCOCK, Goswell Road, London.

DEANE'S WARRANTED GARDEN TOOLS.—Horticulturists and all interested in Gardening pursuits are invited to examine DEANE, DRAY, AND CO.'S extensive Stock of GARDENING and PRUNING IMPLEMENTS, best London-made Garden Engines and Syringes, Colebrook Dale Garden Seats and Chairs.

CAUTION.—To prevent fraud, each tablet bears the registered mark and the names and address of the inventors, as above.

METCALFE'S ALKALINE TOOTH POWDER, 2*s.* per box.—The above may be obtained of most respectable Chemists, Perfumers, &c.

DORKING FOWLS.

TO BE SOLD, a COCK and SEVEN HENS of a favourite breed.—For price, &c., address D. L., *Essex Gazette* Office, Colchester.

GOLDEN SPANGLED HAMBURGHS.—Eggs (fresh) from first rate Birds, at 10*s.* per set of 13.—Address Mr. JOHN COMPTON, Portchester, Fareham, Hants.

DORKING BLUE MOTTLED FOWLS' EGGS 12*s.* per dozen. Took first Prize at Brighton Exhibition of three counties, 1854.—Address Mr. ED. HENDEN, Beehive Inn, Dorking, Surrey.

TO BE LET, with immediate possession, within ten miles of London, and only five minutes' walk from a railway station, a SMALL NURSERY, with a good Business attached, and a Dwelling-house on the premises. Also two Greenhouses, Pits, and Frames.—For particulars apply to RICHARD WOOD, Bedford Nursery, Haverstock Hill, London.

TO FLORISTS AND GARDENERS.

HER MAJESTY'S COMMISSIONERS for the EXHIBITION of 1851 are prepared to receive TENDERS for a large GREENHOUSE, in the Gardens of Grove House, Kensington Gore.—Particulars can be obtained by applying to Mr. WADE, at the Office of the Commissioners, Grove House.

TO NURSERYMEN, SEEDSMEN, AND FLORISTS.

TO BE SOLD, in consequence of the Proprietor retiring from Business through ill health, a capital BUSINESS in the above line, with a first rate connection, and of 17 years standing. The Premises, which are convenient and well situated, will be sold together with the business. Such an opportunity seldom occurs.—For particulars apply to Mr. LENDON, Nurseryman, &c., Wellington, Somerset.

VALUABLE ESTATE.

TO BE SOLD, a FIRST-CLASS ESTATE of the richest land, with a clear rental of near 500*l.* a year; no expensive place to keep up, close to a Railway and Seaport, and about 60 miles from London.—Apply to Mr. JAMES CAIRD, 6, Serjeant's Inn, Temple.

COUNTY OF KILDARE.—VALUABLE ESTATE.

TO BE SOLD, the HOUSE, DEMESNE, and LANDS of NEWBERRY, in the Parish of Carberry, and County of Kildare, consisting of 580 statute acres, held in fee farm. The House is large and commodious, with attached and detached Offices, Water laid all over the House, an excellent Walled Garden, and handsome Shrubberies and Plantations. The Lands have been thoroughly drained, are of prime quality, all under Grass, and in high condition, having been for the last 23 years, as they are at present, in the occupation of the proprietor. The fields are well watered, fenced, and sheltered with good hedges and valuable hedge-row Timber; also some fine old ornamental Timber, and a handsome piece of water in front of the house, with a Mill and Miller's House, and good water power, on the public road side. Upon these Lands there is an abundant supply of the best shell marl, limestone, sand, and gravel. Newberry Hall is 24 miles from Dublin, 3 miles from the large Market Town of Edenderry, 4 from the Enfield Station of the Great Midland Railway, 10 from the Curragh, and 2 from the Ticknevin Station on the Grand Canal. The Kildare Hounds hunt the county within 4 miles. The Church, Post Office, Dispensary, and Court House are in the Village of Carberry, immediately adjoining the Demesne, and the Roman Catholic Chapel about a statute mile distance. A purchaser can obtain immediate possession of the entire.—For further particulars, and order to view, apply to Messrs. H. WALLACE & Co., Solicitors, 30, North Great George's Street, Dublin; Victoria Street, Belfast; or Downpatrick.

TO FLORISTS AND GARDENERS.

TO BE SOLD, A GREAT BARGAIN, by valuation or private treaty, a first-class stock of Geraniums, Fuchsias, Roses, Verbenas, Dahlias, Calceolarias, Mimulus, Chrysanthemums, Hollyhocks, Carnations, Picotees, Pinks, Phloxes, and a general good assortment of Plants for any one in the trade; consisting of a very large Greenhouse 150 feet long, Forcing and Propagating Houses, Cold Pits, and Box Lights, with all sorts of Tools for use; likewise three large Water Tanks, and a good supply of Water; Ground well laid-out; and also a good lot of Fruit Trees in full bearing.

N.B. Situated in Surrey, about nine miles from London, adjoining a railway station, and within half a mile of a good market town; a good Dwelling House upon the premises, can be taken by year or lease.

Dahlias from 3*s.* to 6*s.* per doz.; good sorts and strong plants.
Fuchsias " 6*s.* to 12*s.* " " "
Verbenas " 4*s.* to 6*s.* " " "
Pinks, Picotees, and Carnations, all named, equally cheap.

A good assortment of Bedding Plants cheap.—Apply to Mr. HOOK, 21, Brudinell Place, New North Road, Hoxton.

Sales by Auction.

FANCY POULTRY.—PERIODICAL SALE.

MR. J. C. STEVENS will sell by Auction, at his Great Room, 38, King Street, Covent Garden, on TUESDAY, 5th June, at 12 o'clock precisely, POULTRY of very choice quality, comprising Dorkings from First Prize Birds, Birmingham, 1854; Spanish, from Captain Hornby, Mr. Fox, and Timothy Mason's stocks; Hamburghs, from Manchester Prize Birds; Cochins of large size and good colour; Brahmas, Polands, and Bantams; Ptarmigans, &c.—Catalogues by enclosing a stamped directed envelope to Mr. J. C. STEVENS, 38, King Street, Covent Garden.

POSTPONEMENT OF SALE.
TULIPS IN BLOOM.

MESSRS. PROTHEROE AND MORRIS beg to intimate that Mr. J. Edwards's COLLECTION OF TULIPS will not be sufficiently in flower on the 28th instant to enable intending purchasers to have a full inspection of them. P. & M. therefore deem it imperative to announce that the sale will take place at the Paradise Nursery, Hornsey Road, on MONDAY, JUNE 4th, at 1 o'clock, instead of on the day hitherto stated. Catalogues may be had for two postage stamps.—American Nursery, Leytonstone, Essex.

SALE ON MONDAY, JUNE 4, 1855.

TO GENTLEMEN, FLORISTS, AND OTHERS.

MESSRS. PROTHEROE AND MORRIS will sell by Auction, at the Mart, Bartholomew Lane, on WEDNESDAY and FRIDAY, May 30th and June 1, at 12 o'clock, a first-class collection of Dahlias, Choice Roses, Petunias, Fuchsias and Verbenas; Calceolarias, Azalea Indica, Choice Geraniums, and other Plants in bloom; with a variety of Ornamental Plants for Bedding.—May be viewed the morning of Sale: Catalogues had at the Mart, and of the Auctioneers, American Nursery, Leytonstone, Essex.

WIMBLEDON HOUSE, SURREY.
FINE COLLECTION OF ORCHIDACEOUS, STOVE, AND GREENHOUSE PLANTS.

MESSRS. RUSHWORTH AND JARVIS beg to notify that the seventh day's sale of the effects of the late Mrs. Marryat, on the premises, Wimbledon House, on WEDNESDAY, June 6th, will comprise the collection of Orchids, including some rare and valuable specimens, large Orange and Lemon Trees, Camellias, Azaleas, Ferns, Aloes, Cacti, &c., a large quantity of healthy Bedding Plants, also handsome Stone and Composition Vases and Pedestals, Wire Borders and Trainers, Garden Implements, Frames, and Hand Glasses. Catalogues on the premises, and at the Offices of Messrs. RUSHWORTH & JARVIS, Saville Row, Regent Street; and 19, Change Alley, Cornhill.

CHOICE AND VALUABLE COLLECTION OF TULIPS.

TO BE SOLD BY AUCTION, without the least Reserve, at the Lea Bridge Gardens (adjoining the Lea Bridge Station of Eastern Counties Railway on MONDAY, June 4th, at 1 o'clock precisely, a first-rate collection of TULIPS, comprising all the gems in cultivation. May be viewed two days prior to sale and catalogues had.

THE FORWARDEST TURNIP KNOWN.

SUTTON'S EARLY SIX WEEKS' TURNIP should now be sown for feeding off early. Excellent new seed 1*s.* 2*d.* per lb., 6*s.* per gallon, or 42*s.* per bushel. Mr T. Hickman, of Brimpton House, near Newbury, in a letter dated February 1, says:—

"I must mention the Six Weeks' Turnip as the best sort I have ever seen for earliest and latest sowings. I have grown them several years, and have invariably found them to produce more feed in less time than any other Turnip. I have had them after Wheat of a good size, within six weeks from the time of sowing."

N.B. Carriage free, except parcels under 20*s.* value.

Address, J. SUTTON & SONS, Seed Growers, Reading, Berks.

SUTTON'S LINCOLNSHIRE RED GLOBE TURNIP, the largest and heaviest cropper in cultivation, well adapted for sowing after Vetches, and the main winter crop. This Turnip endured the drought of last summer better than any other, and those crops which were sown later stood the severe winter remarkably well. Price 1*s.* 2*d.* per lb., also Pomeranian, White Globe, Green Globe, Yellow Aberdeen, Skirving's Purple Top, Yellow Bullock, Orange Jelly, Skirving's Swede, Hardy Green-top Swede, and Ashcroft Swede.

Lowest cash prices per bushel may be had on application post free. Address,

SUTTON & SONS, Seed Growers, Reading.

N.B. No Agents appointed.

SKIRVING'S IMPROVED TURNIP SEEDS.

W. SKIRVING, Queen Square, Liverpool, begs to acquaint his friends and the public that he has fixed the price of his TURNIP SEEDS for the season, as follows:—

SKIRVING'S IMPROVED SWEDE TURNIP, at 1*s.* 9*d.* per lb.

" IMPROVED PURPLE-TOP YELLOW BULLOCK TURNIP, at 1*s.* 2*d.* per lb.

All other kinds of Turnip and Agricultural seeds in general, of the most select description, at moderate prices. A remittance, or reference from unknown correspondents, is respectfully requested to accompany orders. W. S. has no agent in town or country.

Liverpool, May, 1855.

TURNIP SEEDS, ETC.

PETER LAWSON AND SON SEEDSMEN to the QUEEN and to the HIGHLAND AGRICULTURAL SOCIETY, beg leave to intimate that they are sending out the following TURNIP SEEDS, for which they respectfully solicit orders. They are all of the most approved kinds of last year's growth:—

AGRICULTURAL SEEDS.

JOHN SHARPE (late of Sleaford), SEED GROWER and MERCHANT, Bardney, is now sending out, of the purest and best selected stocks, Permanent Grass Mixture, 20*s.* per acre; Upland Sheep Walk, 20*s.* per acre; Field or Lawn Mixtures, 9*d.* per lb.. Improving Mixtures for old Swards.

CLOVERS.—Red, English, Dutch, German, French, 6*s.* to 8*s.* per stone; White, 8*s.* to 10*s.* per stone; Italian Rye-grass, fine, imported, 6*s.* to 7*s.* per bushel; Perennial Rye-grass, 25*s.* to 35*s.* per quarter: Mangold Wurzel, 8*d.* per lb., or 7*s.* per stone.

TURNIPS.—Skirving's and Purple-top Swedes, transplanted, and of the purest characters, 1*s.* 3*d.* per lb., or 60*s.* per bushel of 50 lbs.; White Globe or Round, 8*d.* per lb., or 30*s.* per bushel of 50 lbs.; Green Globe or Barrel, 8*d.* per lb.; White and Red Tankards, Lincolnshire Red Globe or Round, Early Sixweeks, Yellow Aberdeen, Orange Jelly, and other yellow-fleshed kinds.

Rape Seed or Cabbage Cole, 3*s.* 6*d.* per peck, or 12*s.* per bushel.

White Mustard, Spring Tares, &c.

For quantities, Purchasers treated with liberally.

Attendance at Sleaford, Market Rasen, Boston, Louth, Lincoln, and Horncastle, on market days.

Bardney Hall, near Lincoln, May, 1855.

NEW BEDDING AND OTHER PLANTS
OFFERED BY

JOHN SCOTT, of the Merriott Nurseries, Crewkerne, Somerset.

VERBENA MISS LUCY.—A beautiful pink, with large truss, and a fine bedder.

" DAVIESI.—A first-rate variety, like Mrs. Mills, but large truss, and fine bedder.

" GENERAL PELISSIER.—Dark plum, very large, flat truss, finer in all its qualities than Andrew.

" ADMIRAL LYONS.—Light lilac, dark eye, extra large and fine.

" CERISE UNIQUE (STEWART'S).—A splendid cherry coloured flower, the finest of its class; 2*s.* 6*d.* each, or the set for 10*s.*

PETUNIA EMPEROR NAPOLEON.—Large, smooth dark crimson flower, with violet throat, the finest crimson yet raised, should be in every garden where a fine crimson bed is wanted.

" EMPRESS EUGENIE.—Bright ruby crimson, and peach, well worthy a place by the side of the Emperor; 3*s.* each, or 5*s.* the pair.

PELARGONIUM TRIANGULARE.—An interesting and rare species, of a climbing habit, will grow several feet in a year, and produces an abundance of beautiful and curious flowers, unlike any other species of this beautiful and numerous family; it is a native of the Cape of Good Hope, and will form a fine pillar in the flower garden during summer; 10*s.* 6*d.* each. One over to the trade when three are ordered.

RHODODENDRON GIBSONI.—The most beautiful white flowering kind in existence, far surpassing the White Azalea in size and form of its flowers: is perfectly hardy, having stood the test of last winter unharmed in small pots, the severest test a plant can have; 1*s.* 6*d.* to 5*s.* each. Also,

LUPINUS CALIFORNICUS.—A beautiful and new tree Lupin, with flowers like a Laburnum, and sweet scented; 5*s.* each. And

ALONSOA WARSCZEWICZI ... ... 12*s.* per dozen } Two
SABBATIA CAMPESTRIS ... ... 12*s.* " } gems.

J. S. would call attention to his List of Bedding Plants in to-day's *Chronicle*, and begs to say that he has still left many thousands; but these are being rapidly sold off, so that early application is necessary to procure fine plants.

J. S. has also now saved his Cineraria Seed from a splendid collection of flowers of unsurpassed beauty, and offers the same at 1*s.* 6*d.* per packet, post free. Now is the best time to sow to obtain large plants for winter and spring flowering.—May 26.

GRASS AND AGRICULTURAL SEEDS.

THOMAS GIBBS AND CO., the SEEDSMEN to the Royal Agricultural Society of England, beg to inform their friends and agriculturists generally that they are now prepared to supply the undermentioned in any quantities required.

Mixtures of Grass Seeds for laying down land to permanent Pasture and Meadow; Irrigation or Water Meadow Mixtures; Upland Sheep Walk Mixtures; Park and Field Lawn Mixtures; Renovating Mixtures for old Swards; Garden, Lawn, or Grass-plot Mixtures; various Permanent Grass Seeds supplied separately to order; Mixtures for one year's lay, do. for two or three years' lay (commonly called "seeds").

CLOVERS.—Red or broad leaved, white or Dutch, Red Suckling, Alsike or Hybrid, Trefoil, Cow Grass or Perennial.

RYE-GRASSES.—Italian (very fine), Annual, improved Perennial, and other kinds.

CARROTS.—Large White Belgian, large field Altringham, Yellow Belgian, long Orange or Surrey.

PARSNIPS.—Gibbs' large Guernsey Cattle, common large.

MANGOLD WURZELS.—Long Red, Orange or Yellow Globe, Red Globe, long Yellow.

CABBAGES.—Large Drumhead Cattle, Thousand headed.

TURNIPS.—Purple-top Swedes, Green-top Swedes, Skirving's Swedes, Green-top Yellow Hybrid, Red-top Yellow Hybrid, lobes or Rounds, Tankard's sorts, Kohl Rabi.

Lucerne, Broom, Furze or Gorse, Field Parsley, Rape, Seed Barley sorts, Wheat sorts, Rye, Sainfoin, Tares, White Mustard, White Silesian Beet, Peas, Potatoes, and all other seeds for the farm.

KITCHEN GARDEN AND FLOWER SEEDS, including all the new and most approved varieties. Assortments made up to suit different sized gardens, or to any given amount.

Priced Lists of both Agricultural and Garden Seeds sent free by post on application to THOMAS GIBBS & CO., Corner of Half-Moon Street, Piccadilly, London.

NEW AND CHEAP FIRST-RATE SHOW AND BEDDING PLANTS.

THE CHEAPEST ESTABLISHMENT IN THE KINGDOM IS AT

HENRY WALTON'S, FLORIST, &c., Edge End, Marsden, near Burnley, Lancashire, where there are propagated annually for sale from 20,000 to 30,000 plants, which, for cheapness and quality, are not to be equalled, being robust and healthy.

GERANIUMS.—Strong blooming plants, of varieties of 1853, such as Empress, Carlos, Neatness, Glow-worm, &c., 25*s.* per dozen; older show varieties, 9*s.*, 12*s.*, and 15*s.* per dozen; 25 for 20*s.*; 50 for 30*s.*, good plants.

FUCHSIAS, new varieties of last season, 6*s.* to 9*s.* per dozen.

CINERARIAS, choice varieties, such as Advancer, Etoile de Vaise, Empress, &c., 10*s.* 6*d.* per dozen; older varieties, good show kinds, 3*s.* 6*d.* per dozen.

PANSIES, 12 distinct fine show varieties, 6*s.*; 25 fine vars., 12*s.*

VERBENAS, new varieties of last season, 4*s.* to 6*s.* per dozen.

DAHLIAS, all the leading show kinds of last season, 9*s.* to 12*s.* per dozen; older varieties 4*s.* 6*d.* to 6*s.* per dozen, extra strong plants.

Bedding Plants, including Scarlet and other Geraniums Salvias, Heliotropes, &c., equally cheap.

ACHIMENES.—Carl Walforth, 1*s.* 6*d.*; Cherita, 2*s.*; Louis Van Houtte, 1*s.*; Gigantea, 5*s.*; Madame Randatler, 5*s.*; Mr. Parparet, 1*s.*; Sir Traherne Thomas, 1*s.*, or the lot post free for 14*s.*; fine older kinds, 6*s.* per dozen.

GLOXINIAS, choice varieties, 1*s.* 6*d.* to 3*s.* 6*d.* each.

H. W.'s Spring List may be had for one penny stamp.

It is respectfully requested that all Orders be accompanied with a Post-office Order, payable at Marsden, Lancashire, unless a reference is given. Orders to the amount of 25*s.* paid to Liverpool, Manchester, Leeds, and Preston; 2*l.* and upwards free to Birmingham and Carlisle; and the like distance, or more distant, extra plants gratis.—Edge End, Marsden, May 26.

MESSRS. E. G. HENDERSON AND SON beg to announce that their new Spring CATALOGUE for 1855 will be sent post free on application, and for 12 postage stamps a beautiful coloured plate representing the following choice plants:—

Achimenes Ambroise Verschaffelt.	Delphinium Hendersoni.
Acacia Drummondi microphylla.	Genetyllis macrostegia (fuchsioides).
Boronia Drummondi.	Fuchsia Queen Victoria.
Bouvardia longiflora.	——— Mrs. Story.
	——— Prince Albert.

Mr. Andrews, the first floricultural artist of the day, has had the getting up of this plate, so that full reliance may be placed on the correctness of the flowers represented and the superior style of the colouring.

Description and Price of the following New Plants will be seen on reference to the Catalogue.

Fuchsia Queen Victoria.	Fuchsia Empress Eugenie.
" Prince Albert.	" Lady of the Lake.
" Water Nymph.	" Snowdrop.
" Raffaelle.	" Mrs. Story.
" Rouge et Blanc.	" Princess of Prussia.

Calceolaria Surprise.	Calceolaria Brunettia.
" Purity.	" Corregio.
" Maggiore.	" Minnie.
" Norma.	" Red Rover.
" Vezzosa.	" Wildfire.
" Ajax.	Phlox Queen Victoria.
Hydrangea hortensis flore pleno.	Tyrethrum Delhayi.
Lychnis Sieboldi.	" Duchesse de Brabant.
Veronica imperial blue.	Achimenes Hendersoni.
" Andersoni fol. variegata.	" gigantea.
Begonia prestoniensis superba.	Scuttellaria villosa.
Lobelia Antwerpiensis.	Verbena la Deese, and others recommended.

Chrysanthemum Hermine, Bole, and others recommended.

May 26th.

NOTICE.

"TO WHOM THIS ADVERTISEMENT MAY CONCERN."—The undersigned having a very extensive connection amongst Noblemen, Gentlemen, their Gardeners, Market Gardeners, and Amateur Growers throughout the country (Lancashire and Cheshire especially), also a shipping connection on an extensive scale amongst the principal leading shipping firms in Liverpool to all Parts of the Globe, will in conjunction with his other business undertake an Agency on Commission or otherwise for the sale of such goods of the very First Class only, as his position and connections would be most likely to effect readily the sale of. His having an establishment of many years' standing in the midst of the daily resort of Gentlemen, Gardeners, and Agriculturists, and also Shipstores situated immediately opposite the principal Docks in Liverpool, where vessels of the largest tonnage sail almost daily to America, Australia, the Crimea, and other parts of the world, offers facilities for the Sale of Genuine Goods rarely to be met with.—Apply, stating terms and description of goods, &c., to GEORGE TAYLOR, jun., Fruit Salesman, St. John's Market, Liverpool. References of the highest class furnished.

BEDDING PLANTS.

J. WOOD AND SONS have a Large Stock of Established BEDDING PLANTS, including Scarlet and other Geraniums, Calceolarias, Verbenas, Petunias, Heliotropiums, Ageratums, Salvias, Gaillardias, Double Senecio, &c. &c., at 1*s.* per dozen. Also a large variety of Pompone and large flowering Chrysanthemums, selection left to ourselves, at 4*s.* per dozen. Strong Rollisson's Unique Geraniums, 9*s.* per dozen.

Address, Nursery Place, Old Kent Road, and Bowyer Place, Camberwell.

NEW ROSES FOR 1855.—Strong flowering Plants of the following 12 New Perpetual Roses for 3*l.* No charge for packing.

Madame Theodore.	Jules Margottin.
Beauté de Lyonnais.	Salet (Moss).
Comtesse Vailliant.	Madame Place.
Madame de Cambacères.	Panaché d'Orleans.
Madame Vidot.	Souvenir de Leveson Gower.
Prince de la Moskowa.	Madame Domage.

Apply to J. and S. FRASER, Nurserymen, Lea Bridge Road, Essex.

NEW SCARLET VERBENA—"MRS. WOODROFFE."

ARTHUR HENDERSON AND CO. can now supply fine strong plants of this very fine new Scarlet Verbena, 4 to 6 inches high, with numerous side branches, and all well hardened, fit for immediate planting out, at the following reduced prices, viz.:—

1 Plant	...	...	1*s.* 6*d.*
12 Plants	...	...	12 0
25 Plants	...	...	22 0
50 Plants	...	...	40 0
100 Plants	...	...	70 0

Specimens of blooms can be sent per post in tin cases (on receipt of 6 Postage Stamps) to those who are desirous of seeing and judging for themselves of the merits of this splendid variety.

Pine Apple Place, Edgware Road, May 26.

ROGERS'S SEED DEPOT AND GARDENERS' REGISTRY OFFICE, Clock House, Chelsea.—A fine collection of PERENNIAL and BIENNIAL Flower Seeds, including choice Geranium, Primula, Calceolaria, Cineraria, &c. for June Sowing.

TO SELLERS OF FLAX SEED AND PURCHASERS OF FLAX STRAW.

MR. W. CALDECOTT, late of Frating Lodge, Colchester, and now Old Charlton, Kent, begs to inform the struggling English Farmers that he, Mr. C., has at length fixed upon a site and machinery for the much wanted and talked of FLAX FACTORY, and is a buyer of any kind of Flax Straw at liberal prices, adjusted by length and strength; that now is the time for sowing this valuable crop in their clean fallows at two bushels per acre, so as to ensure a TURNIP CROP the same year; and that he is a seller of first-rate seed grown by himself (free from foreign Dedder and other rubbish), once from Riga, at 10*s.* per bushel, exclusive of sacks.—Apply early, as the quantity is limited.

TO NURSERYMEN AND GARDENERS.

REIGATE SILVER SAND, 12*s.* per ton, 1*s.* 6*d.* per bushel, or 16*s.* per ton, delivered to any of the London Wharfs or Railways, or within a circuit of five miles. Peat and Loam of various qualities. Sacks 2*s.* each.

KENNARD BROTHERS, Swan Place, Old Kent Road.

HOW TO KILL RATS, MICE, AND MOLES BY HUNDREDS.—A Method will be forwarded with instructions for 30 postage stamps, which will destroy the above vermin quickly and without trouble. 1000 acres may be cleared for a few shillings.

GILBERT DYSON, Hoo, Rochester.

LINGHAM BROTHERS, No. 170, Hampton Street, Birmingham, sole Manufacturers of the improved WOOD and ZINC MONOGRAPH, or LABELS for Garden Borders, Flower-pots, &c., in boxes of 100 each. The Zinc Labels are highly approved of for their lasting durability, can be written upon with the greatest ease, and when dry a permanent inscription is secured. Directions are sent with each box, including a bottle of metallic ink.—Sole Agents in London, Messrs. DRAY & CO., Horticultural Implement Warehouse, 46, King William Street, London Bridge.

HORTICULTURAL SOCIETY OF LONDON.—THE SECOND SUMMER MEETING will take place at the Society's House, 21, Regent Street, on TUESDAY, June 5, from 12 to 5 P.M.

HORTICULTURAL SOCIETY OF LONDON.—NOTICE IS HEREBY GIVEN, that the NEXT EXHIBITION of FLOWERS and FRUIT, in the SOCIETY'S GARDEN, will take place on WEDNESDAY, June 20, at 2 P.M.

Tickets, price 5*s*. each, can be procured at this Office, upon presenting the order of a Fellow; or on the day of the meeting, at Turnham Green price 7*s*. 6*d*. each.

PRIVILEGE OF FELLOWS.—Each Fellow of the Society has free personal admission to these Exhibitions without a Ticket. A Fellow may also personally introduce a friend with an Admission Ticket at half-past Twelve, at Gate No. 4, in the Duke of Devonshire's Road; or, if unable to attend personally, the privilege may be transferred to a brother, sister, son, daughter, father, mother, or wife, residing in the Fellow's house, provided the person to whom the transfer is made be furnished with a Ticket signed by that Fellow.—21, Regent Street, London.

ROYAL SOUTH LONDON FLORICULTURAL SOCIETY. Under the Patronage of Her Most Gracious Majesty the Queen.—The SECOND EXHIBITION of the Season will be held in the ROYAL CREMORNE GARDENS, Chelsea, on THURSDAY, the 14th of June, 1855 (open to all Exhibitors), when Prizes will be awarded for the following productions, viz., Collections of Miscellaneous Plants, Pelargoniums, Fancy Pelargoniums, Cape Heaths, Orchideous Plants, Variegated Plants, Roses in Pots, Specimen Plants, Cut Roses, and Pinks. Also extra Prizes offered by Members for Pelargoniums, &c. Lists of Prizes and the Rules of the Exhibition may be obtained at the Royal Cremorne Gardens, and of the Secretary,

JOHN TAYLOR NEVILLE.

Ebenezer House, Peckham, Surrey.

COUNTY OF GLOUCESTER AND CHELTENHAM ROYAL HORTICULTURAL SOCIETY.

NOTICE.—The SECOND EXHIBITION of the season will be held at the Royal Old Wells, Cheltenham, on WEDNESDAY and THURSDAY, June 6 and 7. Schedules and every information on application to

HENRY COCHRANE, Sec.

14, Colonnade, Cheltenham.

EXHIBITION OF TULIPS.

HENRY GROOM, Clapham Rise, near London, by appointment FLORIST to HER MAJESTY, respectfully announces that his EXTENSIVE COLLECTION OF TULIPS will be in flower, and may be viewed every day from 9 o'clock to 6 (Sundays excepted). Admittance 1*s*.; children half price.

GREAT EXHIBITION OF AMERICAN PLANTS.

JOHN WATERER begs to announce that his unrivalled collection of Hardy, Scarlet, and other RHODODENDRONS, is now on view at the Royal Botanic Gardens, Regent's Park, London. Orders of admission are granted exclusively by Fellows of the Society. The Plants at the Nursery are coming finely into bloom, and will continue in perfection throughout the month of June.—The American Nursery, Bagshot, Surrey, June 2.

WOODLANDS NURSERY, ISLEWORTH.

JOHN DOBSON AND SON beg to announce that the FOURTH ANNUAL EXHIBITION of their unequalled collection of Pelargoniums, Calceolarias, Fuchsias, Pansies, &c., will be held on Thursday next, June 7, 1855, from One o'clock to Dusk. The Band of the Royal Horse Guards Blue will attend. Admission free, by tickets only, which may be had on application. Trains leave Waterloo Station for Isleworth every hour.

WILLIAM BARRATT, LANDSCAPE GARDENER, Wakefield.

*** Plans and Estimates furnished.

WILLIAM MASTERS AND SON, LANDSCAPE GARDENERS, Exotic Nursery, Canterbury.

DAVID FERGUSON, LANDSCAPE GARDENER, GARDEN ARCHITECT, and CONTRACTING PLANTER, Stowe, Buckingham. Now is the time to prepare for planting in September, October, and November.

JOHN HARRISON, NURSERYMAN, SEEDSMAN, FLORIST, LANDSCAPE GARDENER, &c.

Plans and Estimates furnished; Experienced Gardeners recommended: also several Young Men in the Nursery waiting for Gardeners' Situations.—Darlington, June 2

R. BRYAN begs leave to offer his fine Seedling PANSY UNIQUE, it being the finest yellow Pansy yet offered to the public. It is a remarkably strong grower and will prove a great favourite for years to come, on account of its fine appearance in the garden, and as a show flower it is unequalled.

Turner's opinion of it in "The Florist," for December last:—"Bryan's (Whitton Unique), a rich yellow, with large dark eye; shape and substance good, also smooth on the edge; if as lasting in spring as it is in autumn it is both first rate and the best of its class."

Pots of plants of the above first-rate Pansy are now ready, and will be sent free by post at 5*s*. per plant. Post-office orders to be made at Hounslow.—Whitton, near Hounslow, Middlesex.

PRESENT PRICES OF MANGOLD WURZEL, TURNIPS, WHITE CARROT, &c. FOR

BASS AND BROWN'S Advertisement of present prices, see *Gardeners' Chronicle* of April 28th, and May 5th and 12th. Reduced prices for large quantities.

ERRATA.—For "Laing's Purple-top Swedes, 1*s*. per lb.," *read* "1*s*. 9*d*. per lb." the same price of the other three Swedes.

TO THE TRADE.—Prices will be supplied on application.

Seed Establishment, Sudbury, Suffolk.

GOOD SWEDE SEED.

SUTTON AND SONS *have good new Ashcroft, Skirving's, and other Swede Seeds, true to their kinds, warranted all of last year's growth.* Price, in large or small quantities, 2*s*. per lb. Large quantities CARRIAGE FREE. Remittances or references required from unknown correspondents.

Address, SUTTON & SONS, Seed Growers, Reading.

HARDY GREEN-TOP YELLOW SWEDE.—This Swede has stood the late severe winter remarkably well, and can be strongly recommended for weight of crop and highly nutritive properties.

SUTTON & SONS, Seed Growers, Reading, have some excellent Seed which they can warrant of last year's growth, price 1*s*. 9*d*. per pound, 10*s*. 6*d*. per gallon, or 70*s*. per bushel. As every Seed grows well, 2 lbs. per acre will produce a full crop.

IMPORTED ITALIAN RYE-GRASS.—In consequence of the scarcity of this article, THOMAS WHALLEY has imported an additional supply per *Tiber* steamer arrived this week. Price to the trade on application.

2, St. George's Crescent, Liverpool, June 2.

S. WALTERS, Hilperton and Trowbridge, Wilts, begs to say that his Nineteenth Annual Catalogue of Geraniums, Fuchsias, Dahlias, Verbenas, Chrysanthemums, Bedding Plants, &c., containing new and popular varieties only, may be had on application.

GEORGE TAYLOR, JUN.,

CHOICE FRUIT and VEGETABLE SALESMAN,

St. John's Market,

Liverpool.

CONTRACTOR and PURCHASER of CHOICE GARDEN PRODUCE.

SALESMAN on COMMISSION.

Terms, Cash.

Forward as above.

MESSRS. J. AND H. BROWN will forward to any part of the kingdom the following 50 various CHOICE GREENHOUSE PLANTS, one of a sort ... ... 45*s*. 0*d*.

12 Orchidea plants, choice species	... 40	0
24 choice Fuchsias, fine proved varieties	... 12	0

100 choice hardy Herbaceous Plants	... 30	0

100 various plants, Stove, Greenhouse, and Hardy. Price and Catalogue, on application, by post.

Albion Nursery, Stoke Newington, London.—June 2.

NEW PLANTS.

A. VERSCHAFFELT, NURSERYMAN, Ghent (Belgium), is now sending out his following New Plants:

Achimenes Ambroise Verschaffelt	8*s*. 0*d*.
" Docteur Hopf	8 0
" Edouard Otto	4 0
" Edmond Boissier	8 0
Tydæa Warscewiczi	15 0
Rhododendron Prince Camille de Rohan (quite hardy)	16 0

All the above Plants are figured in VERSCHAFFELT'S "Illustration Horticole," which can be seen at Mr. R. SILBERRAD'S, 5, Harp Lane, Great Tower Street, London.

CHARLES TURNER begs to intimate that his New SPRING CATALOGUE is now ready, and contains descriptive lists of—

Dahlias,	Carnations,	Scarlet and Horse-shoe Geraniums,
Fancy Dahlias,	Picotees,	Delphiniums,
Cinerarias,	Pinks,	Mimulus,
Verbenas,	Pansies,	Pentstemons,
Fuchsias,	Auriculas,	Petunias,
Hollyhocks,	Shrubby Calceolarias,	Bedding Plants, &c.,
Chrysanthemums,		

including several new Dahlias, new Verbenas, new White Bedding Calceolarias, &c., offered for the first time. Can be had on application.—Royal Nursery, Slough.

T. F. WINSTANLEY'S BEDDING PLANT LIST is now ready, and can be had on application, or free on post.—28, Market Place, Manchester.

NOTTING HILL, KENSINGTON.

W. TOWNSEND having a large stock of BEDDING PLANTS, consisting of Verbenas, Heliotropes, Fuchsias, Calceolarias, Lobelias, Petunias, &c., &c., is enabled to supply strong plants in 4-inch pots at 1*l*. per 100, delivered free at any of the London Railways, packing not included.

BEDDING PLANTS.

J. WOOD AND SONS have a Large Stock of Established BEDDING PLANTS, including Scarlet and other Geraniums, Calceolarias, Verbenas, Petunias, Heliotropiums, Ageratums, Salvias, Gaillardias, Double Senecio, &c. &c., at 3*s*. per dozen. Also a large variety of Pompone and large flowering Chrysanthemums, selection left to ourselves, at 4*s*. per dozen. Strong Rollisson's Unique Geraniums, 9*s*. per dozen.

Address, Nursery Place, Old Kent Road, and Bowyer Place, Camberwell.

STRONG BEDDING AND OTHER PLANTS.

F. AND A. SMITH'S Descriptive LIST of the undermentioned is now ready, and may be had, post free, on application:—Antirrhinums, Verbenas, Fuchsias, Scarlet Geraniums, Calceolarias, Petunias, Heliotropes, Pentstemons, Chrysanthemums, Mimulus, Salvias, Lobelias, &c. Climbers in variety; also a miscellaneous Collection of Greenhouse Plants. They have now in bloom Verbenas, Fuchsias, spotted Calceolarias, Cactus, Geraniums, Nerium splendens, Hydrangea hortensis, Mignonette &c. The Trade supplied.—Dulwich, Surrey, June 2.

FLOWER SEEDS.

PETER LAWSON AND SON, SEEDSMEN and NURSERYMEN to the QUEEN, Edinburgh, and at 27, St. George Street, Westminster, beg leave to invite attention to their very choice selection of Flower Seeds.

27, St. George Street, Westminster.

JOHN HOLLAND has Superb SHOW PANSIES at 4*s*. and 6*s*. per dozen plants.

Selected PANSY SEED, 1*s*. and 2*s*. per packet.

Descriptive Catalogues now ready.

JOHN HOLLAND, Bradshaw Gardens, Middleton, Lancashire.

SUPERB HOLLYHOCKS, SEEDS, ETC.

WILLIAM CHATER begs to offer packets of seed, consisting of 20 varieties, from his best Show Hollyhocks at 5*s*.; 12 varieties, 2*s*. 6*d*.; and from good double sorts, 1*s*.

Superior Quilled German and French Asters, in 12 varieties, mixed, 1*s*. per packet; separate, 2*s*. Fine Quilled African Marigolds, 6*d*. per packet.—Saffron Walden Nurseries.

LUCOMBE, PINCE, AND CO. beg respectfully to announce that they are now sending out their superb new HYBRID HEATHS, for description of which see former Advertisements.

Exeter Nursery, Exeter.—Established 1720.

LUCOMBE, PINCE, AND CO. beg respectfully to announce that they are now sending out their new White Corolla'd FUCHSIAS; also their new double purple variety for description of which see former Advertisements.

Exeter Nursery, Exeter.—Established 1720.

PELARGONIUMS, ETC.

HENRY GROOM, Clapham Rise, near London, by appointment FLORIST TO HER MAJESTY, begs to say that his Spring CATALOGUE OF PELARGONIUMS, &c., is ready, and will be forwarded on application.

MAY'S MAGNUM BONUM LETTUCE is by far the largest, sweetest, and crispest Lettuce known, in proof of which we possess numerous letters received from parties who had it last season. The addresses of the writers can be had on application. It may be sown all the summer, and will stand the winter. Packets 1*s*. each.

HENRY MAY, the Hope Nurseries, near Bedale, Yorkshire.

NEW SCARLET GERANIUM—EMPEROR NAPOLEON.

JOHN BUTCHER is now sending out the above splendid Geranium, a very decided improvement upon the great favourite Tom Thumb; the habit is more compact, the trusses of flowers very much larger, and for brilliancy of colour far superior; sending up the trusses of flower finely above the foliage. Fine for Bedding or Vases. Good Plants, fit for immediate Bedding, 18*s*. per doz.; extra, 2*s*. 6*d*. each, basket included.

Nursery, Stratford-on-Avon, June 2.

THE PAMPAS GRASS "GYNERIUM ARGENTEUM."

LUCOMBE, PINCE, AND CO. have a fine healthy stock of this highly Ornamental Plant, well established in pots, and fit to send out immediately. It is universally admitted that few plants produce a more beautiful effect than this gigantic Grass. See Woodcut and description of it in the *Gardeners' Chronicle* of November 4th, 1854. Sizes, prices, and all particulars may be had on application to LUCOMBE, PINCE, & Co., Exeter Nursery, Exeter.—Established 1720.

ENGLISH CROWN RAPE, OR COLE SEED.

CHARLES SHARPE AND CO. beg to acquaint the Trade that they can supply any quantity of the above; prices and samples forwarded on application.

Nursery and Seed Establishment, Sleaford, June 2.

SKIRVING'S IMPROVED TURNIP SEEDS.

W. SKIRVING, Queen Square, Liverpool, begs to acquaint his friends and the public that he has fixed the price of his TURNIP SEEDS for the season, as follows:—

SKIRVING'S IMPROVED SWEDE TURNIP, at 1*s*. 9*d*. per lb.

" IMPROVED PURPLE-TOP YELLOW BULLOCK TURNIP, at 1*s*. 3*d*. per lb.

All other kinds of Turnip and Agricultural seeds in general, of the most select description, at moderate prices. A remittance, or reference from unknown correspondents, is respectfully requested to accompany orders. W. S. has no agent in town or country.

Liverpool, June, 1855.

BEDDING PLANTS.—AT 2*s*. 6*d*. PER DOZ.

JOHN SCOTT, Merriott Nurseries, Crewkerne, Somerset (established 1728), has nearly 20,000, in 3-inch pots, ready to be sent out. Post-office Orders payable at Crewkerne. (Baskets and Package at the Expense of Purchaser and not returnable.)

200 Sorts of the best and newest Verbenas.
120 do. Scarlet and other Bedding Geraniums.
20 do. Variegated leaved ditto.
100 do. Fuchsia, all the best; 24 do. Shrubby Calceolarias; 24 do. Petunias; with Anagallis, Ageratums, Cupheas, Heliotropes, Lobelias, Salvias, Senecios, &c. Also the beautiful white Double Pyrethrum.

When a fair proportion of each is taken the price will be 2*s*. 6*d*. per dozen; but if only Calceolarias and Geraniums are ordered they will be 4*s*. per dozen. Catalogues, in which the above are arranged in sections of colour, &c., sent on receipt of a postage stamp. Parties requiring large quantities can have them in store pots by agreement.

SPLENDID NEW GERANIUM.

DENNIS'S ALMA, the very first in its class. Habit, very robust and bushy, flowering in the same proportion as "Alba multiflora," more early and better for forcing; the flowers are produced in umbels of 6 to 12 on very strong footstalks, which require no artificial support, and the flowers last a considerable time after they are all open. Colour, bright rosy crimson, with large dark spots, and in shape it resembles "Dennis's Perfection." Large strong Plants, just opening their flowers, in 6 to 8-inch pots, 10*s*. to 15*s*. each; in 4 or 5-inch pots, 5*s*. to 7*s*. 6*d*. A few extra large Plants, 21*s*. each.

See the remarks on the above Geranium, as exhibited at the Horticultural Society's Meetings, in this Paper, and the "Cottage Gardener" of May 15th. A specimen bloom sent to parties requiring it on receipt of three postage stamps. Post Office orders, on Chelsea, payable to WILLIAM DENNIS, King's Road, Chelsea, London.

TO NURSERYMEN AND GARDENERS.

REIGATE SILVER SAND, 12*s.* per ton, 1*s.* 6*d.* per bushel, or 16*s.* per ton, delivered to any of the London Wharfs or Railways, or within a circuit of five miles. Peat and Loam of various qualities. Sacks 2*s.* each.

KENNARD BROTHERS, Swan Place, Old Kent Road.

LINGHAM BROTHERS, No. 170, Hampton Street, Birmingham, sole Manufacturers of the improved WOOD and ZINC MONOGRAPH, or LABELS for Garden Borders, Flower-pots, &c., in boxes of 100 each. The Zinc Labels are highly approved of for their lasting durability, can be written upon with the greatest ease, and when dry a permanent inscription is secured. Directions are sent with each box, including a bottle of metallic ink.—Sole Agents in London, Messrs. DRANE, DRAY & Co., Horticultural Implement Warehouse, 46, King William Street, London Bridge.

SLATE WORKS, ISLEWORTH, MIDDLESEX.

EDWARD BECK MANUFACTURES in SLATE a variety of articles for Horticultural purposes, all of which may be seen in use at Worton Cottage, on application to the Gardener, Sundays excepted.

Priced Lists of Plant Tubs and Boxes forwarded on application.

(Fig. 1.)

(Fig. 2.)

J. TYLOR AND SON'S BARROW GARDEN ENGINE (Fig. 1), in best well painted oak tub, fitted with improved Pump, universal joint, and registered Spreader, which answers the purpose of the separate rose fan and jet.

No. 2	„	15	„	„	45	„ ...	5 10
No. 3	„	28	„	„	45	„ ...	6 18

J. TYLOR & SON'S BARROW GARDEN ENGINE (Fig. 2), in strong tinned iron tub, well painted inside and outside, with improved Pump, universal joint, and registered Spreader, which answers the purpose of the separate rose fan and jet.

No. 10 holds 8 gallons, throws 25 feet high						...	£2 15
No. 13	„	12	„	„	30	„ ...	3 5
No. 11	„	16	„	„	40	„ ...	4 0
No. 12	„	24	„	„	45	„ ...	5 0
No. 14	„	30	„	„	45	„ ...	5 18

A large assortment of every description of Garden Syringes, Pail Engines, Conservatory Pumps, &c., kept in Stock.

No. 1, Plain Syringe, with rose and jet, diameter of barrel, 1¼ inch, 14*s.* 3*d.*; No. 2, do., diameter of barrel, 1⅜ inch, 12*s.*; No. 3, do., diameter of barrel, 1⅜ inch, 10*s.* 6*d.*

READ'S SYRINGE, with two roses and one jet, 19*s.*

J. TYLOR & SON'S Horticultural Apparatus may be obtained at these prices from any respectable Ironmonger or Seedsman in town or country, through whom alone they will be supplied, and of whom Drawings and Prices may be had.

N.B. Cost of carriage, &c., not included in these prices.

J. TYLOR & SON'S Manufactory, Warwick Lane, Newgate Street, London.

J. TYLOR AND SON'S REGISTERED GARDEN SYRINGE.—Small size, for Amateur use, **21s.** each. Large size, for Gardeners' use, **25s.** each.

Extra for Telescope Tube as shown in engraving for watering plants on stands at a height of 8 feet, so that any quantity of water can be deposited in the pot without wetting the leaves, 10*s.*

By a simple arrangement this Syringe is rendered more effective than any portable Conservatory or Garden Pump ever offered to the public. It is equally adapted for Garden or Conservatory use, and is capable of discharging twice as much water in a given time as any other Syringe now in use. The arrangement consists in attaching a small flexible suction tube to the barrel of the Syringe, through which it is filled with water at every discharge of the previous contents. By this means the Syringe is always charged, and the pull-up stroke of the piston rendered perfectly easy, it having, indeed, no work to do, the barrel being previously full of water. Being thus made self-supplying, a great saving of labour is effected; and the necessity of stooping to fill the syringe at every discharge being done away with, the direction of the water can be maintained for any length of time. It is perfectly cleanly in its action, as it is not possible for any water to get on the outside of the barrel, which is a well-known inconvenience attendant on the use of every other Syringe. Its construction is perfectly simple, and cannot get out of order; the ground in ball valves and fittings used for filling all other patent Syringes being entirely superseded. To be had of any respectable Ironmonger or Seedsman in town or country.

J. TYLOR & SONS, Manufacturers of Horticultural Apparatus Warwick Lane, Newgate Street, London.

N.B. These prices do not include carriage, package, or expense, of delivery in the country.

THE IMPROVED PATENT GARDEN, WATER AND ROLLING ENGINE may be seen in the Agricultural Department at the CRYSTAL PALACE, SYDENHAM.

The threefold use of this neat little Machine must be obvious in Watering, Rolling, or Syringing; it will throw about 60 feet, and is so portable that any ordinary domestic may use it. It contains about 20 gallons. Price 5*l.* 10*s.*

May be had at J. DORE'S Manufactory, 17, Exmouth Street, Clerkenwell, London.

WARNER'S SWING WATER-BARROW (TO HOLD THIRTY GALLONS)

Is intended for all large Establishments where much watering is done by the watering-pot. By its use much time and labour of the Gardener are saved, particularly where the Tank, Pond, or Pump, is at a distance from the garden. May be obtained of any Ironmonger in town or country for 3*l.* 3*s.*

Manufactured by

JOHN WARNER & SONS, 8, Crescent, Jewin Street, London.

WATER YOUR GARDENS WITH THE IMPROVED FLEXIBLE GUTTA PERCHA TUBING.

Half-inch, 4*d.* per foot, light; 4½*d.* per foot, strong; larger sizes in proportion, for manuring land, &c.

Union Joints, 1*s.* 6*d.* each, fitted complete.

Instructions given to affix joints to Taps.

Garden Engines, of great power, 4*l.* 4*s.* each; Self-supplying do., 4*l.* 10*s.* each.

Post Office Orders payable at City Road Branch.

JAMES W. WATTS, Gutta Percha Factory, 27, City Road.

THE HYDRAULIC RAM will raise water, without manual labour, to any height, where a small fall can be obtained.

PARSEY'S PATENT REVOLVING PUMP lifts three times the quantity of water with the same labour, than any other Pump.

Fire, Garden, Deep Well, Liquid Manure, and all other Pumps.

Fountains of every description erected; Rockwork, Grottoes, &c.

Hose Pipe of every kind for watering Gardens.

W. F. RAE (late FREEMAN RAE), Hydraulic Engineer, 70, Strand, London.

FOR WATERING GARDENS.

HANCOCK'S IMPROVED VULCANISED INDIA-RUBBER HOSE AND TUBING is now manufactured especially for the above purpose; is of greater flexibility than any other description of Hose; is capable of resisting great pressure, and made suitable for attaching to the mains of water-works, or to tanks of high elevations.

WATERING HOSE fitted up with the necessary *brass joints, stop-cocks, branches,* and *spreaders complete.*

VULCANISED INDIA-RUBBER SUCTION PIPES, made any length or size for Pumps or Garden Engines.

VULCANISED RUBBER WASHERS, and also in Sheet, any thickness, for all kinds of steam and water joints, or made any size or figure to order.

All communications and orders punctually attended to, addressed to the Manufactory, JAS. LYNE HANCOCK, Goswell Road, London.

HOSE PIPING.

TO ENGINEERS, AGRICULTURISTS, GARDENERS, SHIP CHANDLERS, AND FIRE BRIGADES.

WAITHMAN'S PATENT FLAX TUBING (1 in. to 3 inches in diameter) will sustain a greater pressure, is lighter, less bulky, will wear longer, and is about 60 per cent. cheaper than the leather hose pipe. Manufactured only by WAITHMAN & Co., Bentham, Lancaster.

INCHES IN DIAMETER AND PRICE PER YARD.—¾, 11*d.*; 1, 1*s.* 1*d.*; 1¼, 1*s.* 3*d.*; 1½, 1*s.* 7*d.*; 1¾, 1*s.* 9*d.*; 2, 2*s.*; 2½, 2*s.* 3*d.*; 2¾, 2*s.* 6*d.*; 3, 2*s.* 9*d.*

Testimonial from Mr. Wright, Lancaster.—I beg to inform you that I yesterday tested your piece of 2½ inch Patent Flax Tubing, connected with the Lancaster Waterworks, in the presence of the Mayor, Mr. Rawlinson, Government Inspector, Professor Owen, &c. The column of water at which the tubing was tried was equal to 340 feet in height, or about 150 lbs. on the square inch, and I have pleasure in stating that the hose sustained this pressure most admirably.

Testimonial of Captain Martin, of the Great Britain Steam Ship.—I have much pleasure in being able to tell you that your hose, supplied to the Great Britain and other ships, is well worth the attention of shipowners. It gives us great satisfaction.

Testimonial from Fairbairn & Co., of Leeds.—We have tested your hose, 2½ inch in diameter, with the pressure of the Leeds Waterworks, and found it highly satisfactory.

SIXTEEN OUNCE SHEET GLASS cut to any size up to 44 inches in length, at 2*d.* per foot.

HICKSON'S Foreign Glass Warehouse, 46, Long Acre, (Cash).

BY ROYAL LETTERS PATENT.

THE COSMOPOLITAN GLASS COMPANY.—The Managers beg to inform the Nobility and Gentry, Farmers, Gardeners, &c., that their new List of Prices may be had free on application at the Company's Depôt, 296, Oxford Street, London.

PLATE, CROWN, and SHEET WINDOW GLASS.

HARTLEY'S PATENT ROUGH PLATE for Roofing Conservatories, Halls, and Public Buildings.

Coloured and Ornamental Glass.

CRYSTAL SHADES for covering Ornaments, and

MOORE'S PATENT LOUVRE VENTILATOR, and Lockhead's Patent Perforated Ventilating Glass for Dairies, Greenhouses, Stables, &c.; Glass Milk Pans, Pails, Tests, and Measures Cream Pots and Syphons; Churns, Butter Tests and Slabs; Tiles and Slates; Bee Hives, &c.

Aquariums, Fern Shades, Propagating Glasses, Fruit Protectors, Preserve Jars, Cucumber Tubes, Hand Lights, Flower Vases, Labels, &c., and all kinds of Agricultural, Horticultural Architectural, Domestic, Scientific, and Ornamental Glass.

FOREIGN AND ENGLISH SHEET GLASS WAREHOUSE. 87, BISHOPSGATE STREET, WITHOUT.

T. MILLINGTON supplies the above SHEET GLASS in any size or substance, packed in 100, 200, or 300 feet cases. Same as supplied to Mr. RIVERS and the leading men of the day. Reduced tariff, boxes included.—Per 100 ft.

PATENT ROUGH PLATE, THICK CROWN GLASS, and PATENT PLATE GLASS for Horticultural purposes, at reduced prices, by the 100 square feet.

GLASS TILES AND SLATES made to any size or pattern, either in Sheet or Rough Plate Glass.

Propagating Glasses, Beehive Glasses, Cucumber Tubes, Glass Milk Pans, Glass Water Pipes, and various other articles not hitherto manufactured in Glass.

PATENT PLATE GLASS.—The present extremely moderate price of this superior article should cause it to supersede the other inferior window glass in a gentleman's residence. No alteration connected with the sash is required.

GLASS SHADES, as ornamental to, and for the preservation of every description of goods susceptible of injury by exposure. Prices, since the removal of the excise duty, reduced to half. List of Prices and Estimates forwarded on application.

JAMES HETLEY & Co., 35, Soho Square, London.

AT MR. MECHI'S ESTABLISHMENT, 112, Regent Street, and 4, Leadenhall Street, London, are exhibited the finest specimens of British manufacture, Inlaid Dressing Cases, Work-boxes, Writing Cases, Dressing Bags, and other articles of utility or luxury. A separate department for Papier Maché Manufactures and Bagatelle Tables. Table Cutlery, Razors, Scissors, Penknives, Strops, Paste, &c. Shaving orders executed. Superior Hair and other Toilet Brushes.

THE CHOICEST BEDDING OUT PLANTS
FOR THE PRESENT SEASON.

YOUELL AND CO.

BEG to refer to their Advertisement of the above in the last and three preceding publications of the GARDENERS' CHRONICLE.

ROYAL NURSERY, GREAT YARMOUTH.

PLANTS OF CABBAGE, SAVOY, KAIL, BROCCOLI, AND CAULIFLOWER.

JOHN CATTELL begs respectfully to inform the public that he has a plentiful supply of Plants of his superior true sorts of the above, which will be forwarded to order on receipt of Postage Stamps, or Post Office Order made payable here, at the following prices, package included:—

All the sorts of Early Cabbage, Savoy, and Kail, including Brussels Sprouts, 6*d.* per 100, 4*s.* 6*d.* per 1000; all the sorts of Broccoli, 8*d* per 100, 5*s.* 6*d.* per 1000; Cauliflower, early and late, 10*d.* per 100: Red Cabbage, 1*s.* per 100; Drumhead, or Cattle Cabbage, 4*s.* per 1000. A fine stock of autumn-bedded early Cabbage still to dispose of, 6*s.* per 1000; for large quantities, price on application. Packages containing plants to the value of 1*l.* and upwards will be delivered carriage free to London and to the Edenbridge Station of the South Eastern Railway. A remittance must accompany orders from unknown correspondents. Seed of Cattell's Dwarf Barnes, and of his superior Dwarf Reliance Cabbage, may be had in packets by post, for 12 penny stamps per packet, the former containing one ounce, and the latter half an ounce.

Nurseries, Westerham, Kent.

NEW AND CHEAP PLANTS.

HENRY WALTON, FLORIST, &c., Edge End, Marsden, near Burnley, Lancashire, has now on hand a fine stock of the following, which may be had at the extremely low prices annexed:—Achimenes Carl Walforthi, 1*s.* 6*d.*; Cherita, 1*s.* 6*d.*; Louis Van Houtte, 1*s.*; Gigantea, 5*s.*; Madame Randatler, 3*s.*; Mr. Parparet, 1*s.*; Sir Traherne Thomas, 1*s.*; Henderson, 2*s.*; or the lot post free for 12*s.* Gloxinias, choice varieties, 1*s.* 6*d.* to 3*s.* 6*d.* each. Verbenas of this season, viz., Wonderful, Blue Beard, Lady Lacon, Commander-in-Chief, Empress of France, Florence Nightingale, Rose of England, Tyrian Prince, Eva, Boule de Feu, Lord Raglan, Empress, Mrs. M'Neil, Violacea, Sillistria, and Mrs. Woodroffe, 1*s.* 6*d.*, or 18*s.* per dozen post free. Cilanthus magnifica, 2*s.* 6*d.* each. Begonia Prestoniensis, superb, 2*s.* 6*d.*; extra strong, 5*s.* Eugenia Ugni, 2*s.* 6*d.* Fine Show and Fancy Geraniums, 60*s.* per 100, or 50 for 32*s.* 6*d.* Scarlet and White, and older kinds of Geraniums, 3*s.* 6*d.*, 4*s.* 6*d.* and 6*s.* per dozen. Dahlias, strong plants, 3*s.* 6*d.* per dozen. Bedding Plants, of sorts, equally cheap. Descriptive List may be had for one stamp.

It is respectfully requested that orders be accompanied with Post Office Order payable at Marsden, Lancashire, unless reference is given.

NEW AND CHEAP FIRST-RATE
SHOW AND BEDDING PLANTS.

THE CHEAPEST ESTABLISHMENT IN THE KINGDOM IS AT

HENRY WALTON'S, FLORIST, &c., Edge End, Marsden, near Burnley, Lancashire, where there are propagated annually for sale from 20,000 to 30,000 plants, which, for cheapness and quality, are not to be equalled, being robust and healthy.

GERANIUMS.—Strong blooming plants, of varieties of 1853, such as Empress, Carlos, Neatness, Glow-worm, &c., 25*s.* per dozen; older show varieties, 9*s.*, 12*s.*, and 15*s.* per dozen; 25 for 20*s.*, 50 for 30*s.*, good plants.

FUCHSIAS, new varieties of last season, 6*s.* to 9*s.* per dozen.

CINERARIAS, choice varieties, such as Advancer, Etoile de Valois, Empress, &c., 10*s.* 6*d.* per dozen; older varieties, good show kinds, 3*s.* 6*d.* per dozen.

PANSIES, 12 distinct fine show varieties, 6*s.*; 25 fine vars., 12*s.*

VERBENAS, new varieties of last season, 4*s.* to 6*s.* per dozen.

DAHLIAS, all the leading show kinds of last season, 9*s.* to 12*s.* per dozen; older varieties 4*s.* 6*d.* to 6*s.* per dozen, extra strong plants.

Bedding Plants, including Scarlet and other Geraniums Salvias, Heliotropes, &c., equally cheap.

H. W.'s Spring List may be had for one penny stamp.

It is respectfully requested that all Orders be accompanied with a Post-office Order, payable at Marsden, Lancashire, unless a reference is given. Orders to the amount of 25*s.* paid to Liverpool, Manchester, Leeds, and Preston; 2*l.* and upwards free to Birmingham and Carlisle; and the like distance, or more distant, extra plants gratis.—Edge End, Marsden, June 2.

PAGE AND CO'S COMPOSITION FOR THE DESTRUCTION OF BLIGHT UPON ROSES, WALL- AND GREENHOUSE PLANTS, MELONS, VINES, STOVE FRUIT TREES, CUCUMBERS.—Extra Strong, 4*s.* per gallon, sufficient to make four (Jars and Barrels extra). Directions for use forwarded. Ten gallons and upwards carriage free to London.

After four years' extensive use by the most eminent Gardeners in the kingdom, the superiority of PAGE & CO.'S BLIGHT COMPOSITION is unquestionable, requiring only a trial to insure its general use for destroying every pest to which Plant and Fruit Growers are subject (without injuring the most delicate flowers or foliage) and promoting a luxuriant growth.

See two pages Testimonials, *Gardeners' Chronicle*, March 3, 1855.

MESSRS. E. G. HENDERSON AND SON beg to announce that their new Spring CATALOGUE for 1855 will be sent post free on application, and for 12 postage stamps a beautiful coloured plate representing the following choice plants:—

Achimenes Ambroise Verschaffelt.	Delphinium Hendersoni.
Acacia Drummondi microphylla.	Genetyllis macrostegia (fuchsioides).
Boronia Drummondi.	Fuchsia Queen Victoria.
Bouvardia longiflora.	——— Mrs. Story.
	——— Prince Albert.

Mr. Andrews, the first floricultural artist of the day, has had the getting up of this plate, so that full reliance may be placed on the correctness of the flowers represented and the superior style of the colouring.

Description and Price of the following New Plants will be seen on reference to the Catalogue.

Fuchsia Queen Victoria.	Fuchsia Empress Eugenie.
„ Prince Albert.	„ Lady of the Lake.
„ Water Nymph.	„ Snowdrop.
„ Raffaelle.	„ Mrs. Story.
„ Rouge et Blanc.	„ Princess of Prussia.
„ Miellezi.	„ Souvenir de la Reine.
„ Dominiana.	„ Climax.
„ Maid of Kent.	Geranium Favourite (bedding).
Geranium Rubens (bedding).	„ Silver Queen.
„ Virginium.	„ Pretty Polly.
„ Masterpiece.	„ Quercifolium eximium.
„ Rose d'Amour.	„ Glow-worm.
Calceolaria Surprise.	Calceolaria Brunettia.
„ Purity.	„ Corregio.
„ Maggiore.	„ Minnie.
„ Norma.	„ Red Rover.
„ Vezzosa.	„ Wildfire.
„ Ajax.	Phlox Queen Victoria.
Hydrangea hortensis flore pleno.	Pyrethrum Delhayi.
Lychnis Sieboldi.	„ Duchesse de Brabant.
Veronica imperial blue.	Achimenes Hendersoni.
„ Andersoni fol. variegata.	„ gigantea.
Begonia prestoniensis superba.	Scuttellaria villosa.
Lobelia Antwerpiensis.	Verbena la Déesse, and others recommended.

Chrysanthemum Hermine, Bole, and others recommended.

June 2.

BASS AND BROWN have published a Supplement to their Catalogues, with extracts and descriptions of a few new and select plants, which may be had free on application.

BEDDING PLANTS.—An extensive stock of the finest and most popular, strong and well established, at low prices.

GERANIUMS, GLOXINIAS, ACHIMENES, STOVE, GREENHOUSE, and HERBACEOUS PLANTS, in splendid collections, for which see advertisements in *Gardeners' Chronicle* of April 21 and 28, and May 5 and 12.

Seed and Horticultural Establishment, Sudbury, Suffolk.

WHEELER AND SON'S SHORT SELECT SEED LIST.—Our Priced List of Seeds for this season, containing Descriptions and Prices of the best GARDEN and FLOWER SEEDS, will be forwarded free by post. It is our earnest endeavour to send out all Seeds, whether for the Garden or Farm, of the very best quality and true to name; and as many of the Seeds are our own growing, and are proved before sending out, we generally succeed in giving entire satisfaction to our customers.

We are in daily receipt of most gratifying letters and renewed orders from those we had the honour of serving last year; and as we deliver our Seeds CARRIAGE FREE, we very respectfully solicit the honour of an order from those who have not yet given us a trial.—J. C. WHEELER & SON, Gloucester, Seedsmen to the Gloucestershire Agricultural Society.

CHOICE CINERARIA SEED.

LUCOMBE, PINCE, AND CO. have now ready for sending out Seeds of their very superior CINERARIAS, which have been saved with great care from the finest varieties. The great satisfaction which their Cinerarias have given for several successive years, enables them to recommend their Seed of the present season with much confidence. Packets sealed and warranted by them at 2*s.* 6*d.*, free by post.

Exeter Nursery, Exeter.—Established 1720.

The Gardeners' Chronicle.

SATURDAY, JUNE 2, 1855.

MEETINGS FOR THE ENSUING WEEK.

TUESDAY, June 5—Horticultural ..... 3 P.M.

THE opinion of practical men concerning the merit of bringing the MANGOSTEEN fruit to maturity in this country has now been pronounced in the strongest manner possible by the award of the experienced Judges of the Horticultural Society on the 16th ult., when a Gold Banksian Medal was assigned to the beautiful specimen sent from Syon to Gore House by order of his Grace the Duke of NORTHUMBERLAND. We believe there is no other instance of a medal equal in value to the Horticultural Society's Gold Banksian having been awarded to a single fruit, nor could anything have justified so great a departure from custom except the combination of the greatest skill in gardening with results as important as those obtained by the production of a fruit like the Mangosteen. Had the horticultural difficulties been fewer, or the quality of the fruit been below the highest, the advent of the Mangosteen could not have been celebrated in such a manner.

It is not surprising that those who have had no opportunity of tasting this delicious fruit should be incredulous as to its excellence. It is difficult indeed to speak of it without an appearance of exaggeration. Nevertheless it will be found that the statements of every traveller who has written about the Malay island assign it the highest place at the dessert; and, so far as our own taste can be trusted, we wholly concur in that opinion. Not to occupy space with quotations from English works we will merely cite the words of RUMPHIUS, the celebrated Dutch Governor of Amboyna, who speaks of it in these terms: "When ripe the fruit is as delicate and agreeably sweet as the finest Lansehs (another famous Malay fruit tree, of which a variety called the *Duku* is the domesticated representation which ought next to engage the attention of the wealthy), and may even be mistaken for ripe Grapes. It is at the same time so juicy, that many people can never eat enough of it, so delicious is its fragrance and agreeable its sweetness; and it is believed that the sick, when appetite or the power of eating has wholly gone, are nevertheless delighted with this fruit; or at least if they will not take to Mangosteens their case is indeed hopeless."*

The question still to be considered is whether—the ducal garden at Syon having proved equal to the ripening this fruit, and its excellent quality having been ascertained beyond dispute—it is likely to engage the attention of others, and to become of importance as a general addition to the dessert.

To this, we think, one answer only can be returned; and that in the affirmative. Now that the great preliminary difficulties are overcome, there should be no more reason for failing in obtaining a crop of Mangosteens than of Peaches; the difference consists in the expense, which however most certainly need not exceed that of a house of Pine Apples. During a period of 22 years the Dukes of NORTHUMBERLAND have patiently awaited the result of various costly experiments instituted to determine under what conditions the plant can be kept in health, well knowing that in the end it would bear its fruit; for it is as certain as any

* *Maturi sunt adeo delicati et gratè dulces ac optimæ Lansia vel uvæ maturæ excogitari possunt. Simulque adeo succosi ut multi vix satiari hisce fructibus possint, ob excellentem odorem gratamque dulcedinem, putaturque, quum ægrotus nullum alium amplius appetat, vel edere possit cibum, hoc delectari adhuc fructu; si vero hunc non desiderat de ejus salute desperandum esse, &c.—Herbarium Amboinense, vol.* 1.

other fact in natural history, that all trees will do so when they have acquired sufficient age, although the length of time demanded by Nature to produce fertility is uncertain, and varies from species to species. In the course of these experiments it has been ascertained that the conditions necessary to the Mangosteen in a domesticated state are abundance of warmth, moisture, light, and above all FRESH AIR, skilfully regulated as is described by Mr. JOHN IVISON, the present gardener at Syon, at page 819 of our volume for 1854; where the manner in which FRESH AIR, that most important of all agents, is admitted is fully explained. These conditions anybody can imitate. The difficulty is to obtain fruiting plants, and for these we must look either to supplies in Wardian cases from Penang, or to propagation in this country by cuttings or layers. Perhaps grafting on such stocks as *Xanthochymus pictorius* may also succeed, but it is doubtful whether specimens so obtained will either thrive or "stand." Plants "on their own bottom," as gardeners say, are alone to be trusted. If such could be produced, they will come into bearing immediately, for that maturity of organisation which is necessary to the formation of fruit is transmitted by subdivision, along with every other quality.

That the Syon Mangosteen tree has really attained complete vigour, and a power of bearing fruit hereafter regularly, is proved by the fact that the fruits hitherto ripened are perfectly organised. It is true that no seed was found in the fruit that was first gathered; but one lobe had a seed in the third specimen which has been examined, and RUMPHIUS expressly declares that in Amboyna, where it arrives at perfection, usually only one lobe contains a seed, and very often no seed at all is formed.

One thing which will always give the Mangosteen a peculiar value at the tables of the great, beyond its incomparable quality, is the impossibility of rendering it common. There is no country within reach of our shores that can produce it naturally; it must always, therefore, be a tender exotic, and confined to the wealthy, as Pine Apples once were. It possesses the valuable property of keeping well and travelling well. That which was shown at the meeting of the Horticultural Society had been gathered several days, and yet proved excellent when opened.

We take the present opportunity of repeating that it is no small triumph to the Duke of NORTHUMBERLAND that his Grace's garden at Syon should be the only one in the world in which Vanilla, Cloves, Nutmegs, Litchis, and Mangosteens have been brought to equal perfection. We do not mean that no one has fruited Vanilla and Litchis except the noble proprietor of Syon: for the first has long ago been produced in other gardens, and the Litchi ripened formerly in the forcing-house of Mr. JOHN KNIGHT, of Lee Castle. What we do say, and what we think is a most striking illustration of what wealth, intelligence, and skill may effect, is that all the five important productions we have enumerated were never before brought to perfection in one and the same establishment; unless perchance in some Dutch island in the Malay Archipelago.

WE find in the "Revue Horticole" an account of two NEW ESCULENTS, which are said to deserve notice. Having no personal acquaintance with them we confine ourselves to a translation of what is said about them by Mr. MÜLLER, superintendent of the Botanic Garden, Upsal, who sent the seeds to the Botanic Garden, Hamburgh.

"I particularly recommend to your notice these two new kitchen garden plants, *Chærophyllum Prescotti* and *Rumex vesicarius*. We received the first from St. Petersburgh in the spring of 1852, but it did not occur to me till last autumn that its fleshy root, as large as a Parsnip, might be worth cooking. The seeds being then ripe it was to have been expected that the roots would prove woody; but I was agreeably surprised to find it tender and very nice (*de très-bon gout*). In flavour it is not unlike the Turnip-rooted Chervil (*Chærophyllum bulbosum*), but as it is much larger and good even after seeding, it is a much more useful plant. Cultivation will probably increase its size. In my case the seeds were sown in spring, but I should expect the roots to become larger if the seeds are sown in autumn, like those of *Chærophyllum bulbosum*. The plant is perennial and not biennial like that plant. As it is a native of Siberia, cold has no power over it, and it succeeds perfectly in good damp garden soil. It might be called the Turnip-rooted Siberian Chervil."

The other plant, *Rumex vesicarius*, is a kind of Sorrel. "When dressed like Spinach," says Mr. MÜLLER, "it is very nice. The leaves are slightly acid, and if mixed with common Spinach greatly improve it. The plant is an annual, with great fleshy leaves, and grows perfectly in any rich moist soil."

These two plants seem to deserve the attention of seedsmen.

New Plants.

128. ABIES HOOKERIANA. *A. Murray, in Edinb. new Phil. Journal*, i., 289, t. 9.

129. ABIES PATTONIANA. *Ibid.*

"This species is allied to *A. alba*. The cones have considerable resemblance. They are of the same colour, and the scales in both are somewhat saucer-shaped, and have their edges smooth; but *Hookeriana* has the cone, and more especially the scale, seed and wing larger. These, as well as the bract at the back of the scale, are differently shaped, as will be seen from the figures in the etching. The habit of the tree, and the manner of growth of the leaves, is also different. In *A. alba* the leaves are inserted pretty regularly along the branch. In *Hookeriana* they are crowded together, curling upwards a little, after the fashion of *A. nobilis*.

"This *Abies* has also considerable resemblance to *A. Pattoniana*, introduced three or four years ago by Jeffrey, the collector sent out by the Edinburgh Oregon Expedition, and as that species is little known (having only been described and figured in a private circular issued by the Association), I shall enter a little more at length into the distinctions between the two than I have done with *A. alba*.

"Both *A. Pattoniana* and *A. Hookeriana* are trees of exceeding beauty, but the former is described by Jeffrey as being 150 feet in height, and towering over the rest of the forest. The height of *A. Hookeriana* was only about 50 feet. One tree that my brother cut down measured 47½ feet in height, and was 20 inches in diameter at the stump. The timber is hard and tough. It is more distinguished by its gracefulness than its size. With the exception of *Cupressus Lawsoniana* (to be presently mentioned), my brother describes this as the most beautiful of the new discoveries which his expedition produced. Its gracefulness and elegance were the qualities on which he particularly dwelt. The cones of the two trees give many points by which to distinguish them. They do not differ much in size, but those of *A. Pattoniana* are of a dark brown colour, and those of *A. Hookeriana* of a light fawn colour, somewhat of the hue of the cone of our common Larch, or of *Abies alba*. The scales of *A. Pattoniana* are a third or a half smaller than *A. Hookeriana*. They are deeply crenulated quite down to the place which the bract covers, and that place is smooth and prominent. The scales of Hookeriana are not crenulated, an evanescent raised line only shows itself here and there. The shape of its scale also is not regular; it is cut out on each side, but one side is always more cut out than the other; where the cutting-out has commenced, the scale has thinned off, so as to be membraneous. In *A. Pattoniana* there is no such thinning off nor cutting out. In its scale the place where the two next scales have lain over it is not, or at least is scarcely, to be distinguished from the exposed part. In *A. Hookeriana* it is very marked, there being an immediate rising or thickening in the line of the scale just beyond where they lay, showing the exposed part very distinctly of a curved triangular shape. The surface of the covered part in *A. Hookeriana* is duller and more opaque than the exposed part, and the streaks or raised lines are less perceptible. In *A. Pattoniana* no such difference exists. The bract in *A. Pattoniana* contracts at about two-thirds of its length from the top, and has a projecting purple ear immediately before the contraction. *A. Hookeriana* has no such ear, and the contraction takes place at one-third from the top instead of two-thirds. This ear is not to be confounded with a sort of projection which both have at the top angles. The seed and the wing of *A. Pattoniana* are both about one-third shorter than in *A. Hookeriana*, and the wing of the former has a purplish-brown tinge at the top and back, which does not exist in the latter. This species was found high up the Californian mountains, about lat. 41° N., where the ground was already covered with snow, on the 16th of October.

"We have named this species in honour of Sir W. Hooker, who has done so much for the botany of this country. The species *A. Pattoniana* was justly named by the committee of the Oregon Botanical Association after Mr. Patton, of the Cairnies, in Perthshire, a gentleman who is following out with equal zeal and discrimination a series of experiments, having for their object the ascertainment of what new Pine and other forest trees can be grown with most advantage in our climate."

130. CUPRESSUS LAWSONIANA. *A. Murray, in Edinb. new Phil. Journal*, i., 292, t. 10.

"This was the handsomest tree seen in the whole expedition. It was found on the banks of a stream in a valley in the mountains; it is about 100 feet high, and 2 feet in diameter. The foliage is most delicate and graceful. The branches bend upwards at the end like a Spruce, and hang down at the tip like an ostrich feather. The top shoot drops like a Deodar. The timber is good, clear, and workable.

"This species has been named after Messrs. Lawson, the enterprising nurserymen of the Scottish capital, who after having distributed and made generally known so many species of this family of trees, are well entitled to have their names connected with a species likely to prove a general favourite; and the attention comes well from my brother, who, if he has received praise and commendation from others for the extent and excellence of his collection, has received from these gentlemen the solid pudding, they having purchased the whole of his collection at a liberal price."

This has singularly small cones, and branches so closely covered with blunt convex whole-coloured scales, not depressed at the sides, as to resemble those of *Juniperus phœnicea* or some such plant. The curved ends of the twigs remind us of *Juniperus incurva*. It appears to be very handsome.

VEGETABLE PATHOLOGY.—No. LXXIV.

318. CHLOROSIS 7. (*Accidental and Functional*) YELLOWNESS.—Before leaving this subject, which might be greatly extended if different species of plants affected by the diseases were treated separately, it may be well to say a few words on the Chlorosis of Vines. It is not uncommon in badly-managed houses to see the foliage of Vines either wholly or in part of a sickly yellow tint. Where it is partial it may arise sometimes from keeping the branches too thick, and if this is the case it is easily remedied, but the evil often extends further, and scarcely a single vigorous leaf is to be seen on the plant. If the disease is much aggravated the shoots are weak, the blossoms if produced at all set badly, and the Grapes when formed do not arrive at full perfection; and if it is of less immediate urgency, shanking and other bad effects are sure to follow. In almost every case the evil arises not so much from the construction of the house as from the condition of the roots, and it is there that the remedy must be applied. In general the condition of garden soil is such that it is a great mistake to plant deeply. It is true that in Madeira and some other Vine countries where the soil is rocky, and is subject to burning heat, it is found that the cuttings can scarcely be made too long. Moisture can only be found at considerable depths, and the soil is so porous that there is no fear that the air should not penetrate sufficiently, much less that there should be any stagnant fluid, impregnated with noxious matter to impede the growth. The conditions, however, are totally different in our gardens, and after a proper drainage has been secured it is often desirable, with a view to prevent the penetration of the roots too deeply, to place a course of stones or some other obstacle, taking care, however, that it shall not interfere with the drainage. It is easy enough to supply moisture or nutriment from above if these be requisite; or, if there be any fear that the heat shall injure the superficial roots, to mulch the ground to such a depth as may be necessary. If these conditions are secured there is no fear that the foliage within the house will be unhealthy, except some palpable cause exist within; and if the foliage is good, at once free from rank luxuriance and meagre yellowness, the crop is almost sure to succeed.

319. The same principles apply to fruit trees, which often suffer from Chlorosis induced by bad draining. It is quite useless and unreasonable to expect that an orchard will be profitable if the temperature of the subsoil be constantly depressed by stagnant water, which is loaded at the same time with matter injurious to health. It is true that trees may thrive on the banks of a running stream, but then there is a constant succession of fresh fluid. In the other case the growth will be miserable; the branches, in consequence of the sluggishness of the bark, will soon be covered with Moss and Lichens; the young shoots will not be properly exposed to the effect of light, and the whole tree will gradually decline, producing less and less every year, till it perishes altogether.

320. CHLOROSIS 8. *Yellowness produced by parasitic Fungi.*—It has already been remarked that the effect of some fungi is to stimulate plants and induce a more intense growth of chlorophyll, and Bunt was adduced as the most familiar instance. But this is by no means the case with a large tribe of fungi, which live at the expense of the tissues of the matrix. The chlorophyll in such cases may have originally been produced in great perfection, even in greater quantity than usual, as in Potatoes attacked by Botrytis infestans, but this is not always the case. The Anemone leaves which are attacked by Æcidium leucospermum may be recognised at a glance by their chlorotic aspect, independent of their change of form from the first moment of their appearance above the surface of the soil. In many cases, however, the evil arises from the appropriation by the parasite of chlorophyll already elaborated, and thus it is that in our pastures and cornfields multitudes of plants, as Poppies, Crowfoots, &c., exhibit a chlorotic appearance by which a practised eye may at once recognise the presence of some parasite. Happily the evil is more prevalent amongst what are commonly called weeds, and it is one amongst the many means provided by the Almighty for the suppression of noxious species, or for preserving the balance of creation. Sometimes, however, crops such as Lucerne, Tares, &c., are attacked, and a good deal of mischief is done without any means of materially repressing the evil. An early application of sulphur in some form or other would no doubt be efficacious, but the evil is seldom discovered till it is too late to apply a remedy.

321. CHLOROSIS. 9. (*Yellowness produced by Insects*) —The pale unhealthy tint assumed by Hops attacked by the fly is an instance in point. The consideration of this and like cases must, however, be reserved till we consider the effects of insects on vegetation. *M. J. B.*

POLYGALAS.

AMONG these are some of the gayest and most useful inmates of our greenhouses. And the best varieties are plants of easy culture, which, with even ordinary care, soon form fine large symmetrical bushes, bloom most profusely, and remain longer in beauty than most hard-wooded plants. But, although all the more desirable

varieties are of free growth, persons commencing their culture should be careful to procure good healthy promising young plants, avoiding pot-bound leggy things, which are very unfit for beginners. If plants are procured at once, the best situation for them for the next two months will be near the glass in a cold pit or frame, where they can be secured from bright sunshine, and afforded a free circulation of air. If they appear to require more pot room, this should be seen to at once, in order to get them well established in their pots before winter; and it will not be advisable to give a very large shift after this season. Attention should be paid to having the ball in a nice moist healthy state; for no plant should be repotted except this is the case, and particularly hardwooded plants. For soil, use good strong rich fibry peat, with a small proportion of rich mellow turfy loam, well intermixed with plenty of sharp silver sand, and some lumpy bits of charcoal, or clean small potsherds to keep it open and permeable to water, and ensure good drainage. If stopping is required, this should be done as soon after potting as the roots appear to have taken to the fresh soil; or in the case of plants that do not require repotting, it should be done at once, and the shoots should be kept nicely tied out, in order to induce a bushy habit of growth.

The best situation for the plants in winter is near the glass in the greenhouse, where they will have all the light possible and a free circulation of air on every favourable opportunity. At that season water must be adminstered very carefully, never giving any until it is absolutely wanted, and then sufficient to thoroughly moisten the ball. Turn the plants occasionally, to prevent their getting one-sided through the shoots turning to the sun, and give the leaves a gentle washing with the syringe occasionally, to clear them of dust, &c.; but do this on a bright morning, so as to avoid damp. About the middle of March the plants should be cut back, if necessary, to secure a sufficiently close growth—for they will be too small to be of any service for flowering—and placed in the warmest end of the house, or removed to where the night temperature may average about 45°, syringed over-head on bright days, and kept rather moist. Here they will soon push their buds and start into free growth, and when this is the case the roots should be examined, giving a liberal shift if the ball is covered with healthy roots. Afford the same careful attention after repotting as recommended above, keeping the atmosphere moist, and watering sparingly until the roots strike into the fresh soil. Perhaps the best directions that can be given as to temperature during spring would be to regulate it according to the amount of light, keeping the plants growing as freely as can be done without inducing weakly growth; but by all means avoid this, which would spoil the specimens. Remove to a cold frame as soon as the weather becomes at all favourable, and treat them during the summer as recommended for last season, remembering that minute attention and careful management is the only way of securing handsome specimens. If a second shift should be required in course of the summer see to this as early as can properly be done, in order to have the pots pretty full of roots; also discontinue shading early in autumn, and expose the plants freely to light and air, so as to get the young wood rather firm before winter.

The same treatment as recommended for last winter will be suitable again, but if the plants are considered sufficiently large for flowering, they should be kept in a cool airy part of the greenhouse until they come into bloom, when they may be removed to the conservatory, where, if they are shaded from bright sunshine, they will last some two months in beauty. *Alpha.*

GARDENERS FOR THE CRIMEA.

While Government has been lately exerting itself in behalf of our brave army in the East by sending out engineers to erect huts, &c, for its convenience and comfort—"navvies" to lay down railways for the more speedy transmission of provisions and materials of war—cooking apparatuses for use in the camp—nurses for the sick and wounded, and a celebrated cook to teach the soldiers how to make the best use of their tea, coffee, and arrow-root in the hospitals, and how to dress to the best advantage their rations in the field, there has, nevertheless, been something overlooked which ought to be supplied without longer delay, and which, if it had been thought of, and acted on three months ago, would have been so much the better, but which might yet be attended with advantage, if the siege of Sebastopol and the war in the East are likely to last six months longer, and that is sending gardeners to the Crimea. Now that cooks have gone gardeners ought to follow, and I am not sure that the latter ought not to have preceded the former. Gardeners to raise abundance of vegetables would promote the health and comfort of the army, instead of depending for its supply on uncertain markets situated at too great a distance from where the articles are required.

Admitting that vegetables could be obtained in abundance at different places on the shores of the Black Sea, and that they could be conveyed in steamers in a comparatively short time to Balaklava, and thence by rail to the camp, a very considerable period must elapse from the time when they were gathered till they could be delivered for the use of the troops; and, consequently, they would become very much deteriorated in quality. All I think will allow that a very short time is required to spoil green vegetables when closely packed, even in this country. Few will dispute the fact that vegetables sold in the London markets are inferior in point of quality to those sent into a gentlemen's house in the country, simply from their having been for a short time packed closely together. For the market, they must necessarily be gathered and packed the previous day, travel to town during the night, and in warm weather they are often sold in a heated state, even in that short space of time. But how do matters stand when they are closely packed in a ship in large quantities for a much longer period? They must be in a state of incipient fermentation at least, before they can reach their destination, and I much doubt if any medical man would recommend vegetables to be eaten in that state, or consider them wholesome. But independent of the great luxury it would be to officers and men to have a proper supply of fresh vegetables every day, or of how it would minister to their health, comfort, and efficiency, and possibly be the means of keeping many out of the hospitals, the plan may be recommended upon economical grounds, it being cheaper to provide the articles on the spot than to trust to an uncertain supply from a great distance. Large quantities of Peas, Beans, Kidney Beans, Scarlet Runners, Cabbages, Cauliflowers, Radishes, Lettuces, Cucumbers, Carrots, Onions, &c., might be produced in a short time, and would doubtless be looked upon as a God-send by the troops. A few good kitchen gardeners, with a staff of some 15 or 20 men each, placed in different localities, within reach of the camp, and out of range of the Russian guns, would produce an enormous amount of vegetables in a few weeks in such a climate as that of the Crimea. Great quantities of suitable manure could be easily procured from the cavalry encampment, which being trenched into the ground at a proper depth would greatly tend to meet the difficulties attending dry weather during the summer months. The principal gardeners would find suitable employment in directing the labour of the men under their superintendence, sowing all the seeds with their own hands, and seeing that the vegetables were gathered in the state most fit for use.

Perhaps some would raise objections to what has been here suggested on the ground of the great uncertainty of all warlike movements, and because the scheme has somewhat too domesticated, easy, and comfortable an appearance about it. But why not make even camp life as comfortable as circumstances will admit, and deprive war of as many of its horrors as possible. I am certain that, should the authorities at the War Office ever entertain the idea of sending gardeners to the Crimea to raise vegetables for the use of the army, the organisation of such a scheme could be speedily and easily effected; and once the machinery was in motion with such an object in view, it would doubtless be found to work as satisfactorily as ever did the "navvies" at Balaklava. *A. D.*

Home Correspondence.

Protection of Fruit Trees, &c.—My trees having borne such abundant crops of Apricots for three successive years I was rather fearful that this year there might be a failure, and those fears were augmented by the unusual severity of the season. There was a prodigious

bloom, and every thing seemed to promise as large a crop as last season, but the frosts continued every night. On the 3d of May the thermometer was down to the freezing point, and on the 5th of May there was ice here as thick as a penny piece, and my gardener, Mr. Evans, was met by wet fogs, which penetrated into every corner. After feeling much for the severe losses of my brother gardeners during this severe spring I feel thankful that my own losses have been but trivial; and I have the pleasure of informing you that my canopy, represented by the accompanying woodcut, has secured a moderate crop of Apricots; last year we counted on my walls 1800 Apricots before thinning, but this year we must be contented with 2184 (*sic*) before thinning—more than we expected. But it is not wholly a loss, for when there is a moderate crop the fruit generally swell to a larger and finer size, and it must never be forgotten 100 Apricots well thinned-out will greatly exceed in weight 200 left in bunches in a slovenly manner, and have a far superior flavour. Those sheltered in the Apricot-house, without any artificial heat, promise a fair crop, but will ripen later than those on the walls. The amazing swarms of wasps which visited this country last August must not pass without observation. In this vicinity there was scarce a field that had not two or more nests. They destroyed all the wall-fruit—devouring the Nectarines and Plums even when as hard as stones. Happily an early frost checked their career, and saved a fine Pear crop. We used to destroy these noxious insects with sulphur and gunpowder, but this year we adopted an easier and more effectual remedy, using coal-tar at 4*d.* per gallon. We poured about a pint of coal-tar, from the gas-works, into the mouth of each hole, and digging even the next day, not a single wasp was found alive. This year I have offered a reward of a penny for each queen wasp brought me during May and June, and I have already received a considerable number—114. They are mostly found amidst the Gooseberry bushes, feeding on their buds as they open. The great collection of Evergreens and scarce and variegated plants at my summer residence, 6 miles distant, must not be passed over. My Evergreens got through the first frost without receiving scarce any injury; but the second frost—thermometer 13° to 15°—scorched two Cedars of Goa, 15 feet high, a variegated Aristotelia, a numerous variety of Phillyreas, and a variety of Laurustinus; while the varieties of French Holly 30 feet, Arbutus 33 feet, another Goa Cedar 8 feet, variety of White Cedar 6 feet, Thuja pendula, Arbutus andrachne 4 feet, and a very great number of others, withstood the severity of both frosts in the open air, and were as fresh and green as ever. About 10 years ago I bought a fine Deodara 3½ feet high, and at the same time turned another out of a pot about a foot. They are both now 15 feet high, but the latter one will speedily outstrip its rival; and it shows us the advantage of choosing small plants, and reminds me of a letter which I wrote in 1826 to the Bath Society, strongly urging the use of Acorns in making plantations of Oaks. I conclude my letter with a toast—"Milder seasons and success to gardening." *W. B. M. Lisle, L.L.D., St. Fagan's, Cardiff.*

Lolium temulentum or Darnel.—Being aware that this Grass has always been considered poisonous, I was induced, while living in Lancashire about two years ago, to make some inquiries as to whether any instances were known of its having exercised any deleterious effects upon persons who might have partaken of it, as it seemed impossible from the great quantities of it that were very generally found growing in the fields amongst the Wheat that the two could be thoroughly separated when they came to be reaped, and the grain prepared for food. I ascertained, however, that it was customary where Darnel was much intermixed with Wheat to put the latter through a sieve, whose meshes were of such a size as to retain the larger grains of the Wheat, allowing only the smaller grains and the seed of the Darnel to pass through. My informant told me of an instance in which this mixture had been ground, and part of the flour used in making a pudding, of which a number of persons partook; the effects were nausea, vomiting, and staggering, as if inebriated. The above particulars, although they do not make us acquainted with the quantity that will produce a certain effect, still go to establish the fact that Darnel is poisonous, and may perhaps serve to elicit from some of your other correspondents something more conclusive on the point. *Robert Grey, Hadzor Gardens, Droitwich.* [We should be very glad of further evidence upon this doubtful point.]

The Potato Disease again!—I herewith submit to your inspection specimens of Potatoes called here the early Dutch. I planted them on the 20th of March, and a slight covering at night is all the protection that has been given them. Is it the disease they are attacked with? One of the stalks is much rotted at the base, as is the tuber growing to it. We have had a return of cold east wind, with frost and hail, this morning, after a few days' fine growing weather. *E. K. S., Pembrey, Llennelly, South Wales.* [This is a bad state of the Potato disease.]

Rhododendron Dalhousiæ.—A fine plant of this beautiful Rhododendron is now in flower in the garden of James Hunt, Esq., of Pittencrieff. This is the first of the kind that has flowered in Scotland on its own roots. *W. W. E.*

The Balsam.—Few indoor annuals are more striking or showy than a well-grown Balsam, which is quite a boon to us in the decoration of the greenhouse and conservatory during the late summer and autumn months. It is often, however, badly managed, and allowed to remain in the seed pot till the young plants are drawn up like straws. They are then potted off, two in a pot, and put into some out-of-the-way corner in the forcing-houses, where they again "draw" and become so lanky as not to be able to support their own weight. The order then is, "Get those Balsams potted off into single pots and staked up." Now, this is mismanagement, for on no account should stakes be applied to Balsams; sometimes, however, you may find weaker varieties than others, and in that case a short stick should be used to keep the plant steady in the

pot. The mode of culture I adopt is as follows. I generally make my first sowing about the middle of April. I get a 6-inch pot and fill it half up with broken crocks; I then fill up to within half-an-inch with a fine-sifted compost of leaf soil and old decayed manure (equal parts), with an admixture of sand to keep the whole porous. I now put in my seed (two dozen and a half seeds will be plenty in the pot), and cover them over lightly with the above-named compost, giving a gentle watering with a fine-rosed watering pot, so as not to disturb the seeds. I finish by plunging them in a mild bottom heat, so placed that they can be kept close to the glass, when the seeds will soon germinate. As soon as the plants have made a proper start from the seed leaf I get a compost made up of the following materials: Two parts sifted rotten dung and one of leaf soil, and a little loam sifted with it, together with a liberal quantity of sand to keep the whole open, so as to ensure a speedy root action. I mix the whole well, and prepare as many 3-inch pots as I require, and pot off singly. It will not be out of place to notice here that some use larger pots, and put two plants in them, thinking thereby to save a little room. This is, however, a mistake. Nothing is more inconsistent with the well-being of Balsams then cramming two of them in a pot; the roots get woven together, and in parting them at repotting time they get injured and the plants are thrown into bloom before anything like half their size has been attained. Having potted them off singly at first, I give them a slight sprinkling with water and remove them to a hot-pit or any other convenient place where they can be kept close to the glass, and where the temperature does not fall below 65° at night. As soon as the pots are nearly full of roots I repot into 4-inch pots, using the same soil as before, except in a rougher state, and containing rather more dung; a little of which is also mixed with the potsherds, among which the roots love to creep. A bed is now made up for them with materials in which there is a slight declining fermentation; in this the pots are plunged, and kept rather close for a day or two, and a slight shade is used should the weather be sunny. I repot again when I see the roots coming through the hole in the bottom of the pot, using an 8-inch pot, in which they are bloomed. The soil now employed is very rich, viz., two parts of old decomposed night-soil and one of leaf mould, and rich fibry loam and peat in equal portions, with a free supply of silver sand thoroughly incorporating the whole together. The plants are again plunged, and air admitted freely on fine days, syringing early in the afternoon and shutting close up; the atmosphere is thus kept moist, which, with the ammonia arising from the dung, gives them a fine strong healthy appearance, and when in flower they are removed to the conservatory, and supplied with liquid manure twice a week. By sowing at intervals, Balsams may be had during the whole of the autumn. *W. F.*

Hedges.—In an article which appeared in your Paper of the 19th ult. regarding the editor of the "Forester" giving advice on the formation and treatment of hedges, the writer "G. W. L." appears to have missed the point. If he will read the "Forester" again, he will find that Mr. Brown, the editor, only recommends a mixture of Thorn and Beech where wished for by way of ornament. This is a matter of taste, but where soil is of a light gravelly nature on a dry bottom Beech will thrive well where Thorns would scarcely succeed. Of this I have ample experience. As regards treating every tree alike, how can your correspondent compare the treatment of Thorns with that of young Oaks—the one to be reared for a hedge, the other for a timber tree? The less pruning hard woods receive the better, provided the top can always be kept ascending; on the contrary, the more side branches one can get on Thorns for a fence the more compact will the latter be. Let "G. W. L." pull out his pocket knife, prune a few Thorns, and let a few remain unpruned, the same with Beech, and he will soon see his problem solved as to the accuracy of cutting over of Thorns and not of Beech. His system of planting on raised up dykes, unless in extreme cases, I do not remember the "Forester" recommending. If he would appeal to some of the Lincolnshire farmers about planting on raised ridges, they would soon satisfy him on that point, for I must say that that county has probably done more than many others in that branch of rural economy. The manuring of land for hedges is impracticable unless it could be kept up by rotation. It would do more harm on bad land than on good. How would "G. W. L." like to be nursed for a few years on carnivorous principles and afterwards be fed like a Russian soldier on black rye bread and water? Would not this alter the entire system? If poor thin land is to be made to rear good Thorn hedges, trench it 4 or 5 feet broad and 2 feet deep, reject all bad subsoil, and make all well up with good soil from a distance, if that can be had. Let this lie for a time, and then plant your Quicks, when they will push rapidly, remembering to cut them all over 1½ inch above the ground; if not cut they will have enough to do to make leaves, but by the former system I have seen shoots the first year 3 and 4 feet long. *A Reader.* [We did not understand the remarks by "G. W. L." to refer to "Brown's Forester," but to the writer of an article in the "Quarterly Review."]——I am surprised that the notions of hedge management to which "G. W. L." refers have not been set to rights by some of your correspondents, for in every statement the "Quarterly" is quite sound, and quite in accordance with the practice of the best hedgers, who have tried many methods of growing fences. "G. W. L." appears to be perplexed at one plant receiving different treatment in its pruning from another; but pruning, as well as soil, manure, situation, temperature, &c., should be varied to suit the nature of the plant. Everything judiciously managed, Hawthorn plants should be cut down to within a few inches of the ground-mark, on being planted out into the line of fence. There are just three cases in which these plants had better be allowed to stand for a year without heading down: 1st, when they are very small plants; 2d, when the plants have been injured from drought, lateness in transplanting, or any other cause which has the effect of reducing their growth; 3d, when the ground is not congenial from being newly trenched, and want of exposure to atmospheric influence, &c.; but in neither of these cases is it wise to insert the plants where the cost of fencing and management is greater than in the nursery. Let every thing be in proper trim, and your headed plants will rise from 16 to 24 inches the first season. Several mixtures of plants form hedges both compact and permanent. *W. R., Aberdeen.*——I quite agree with the remarks on the "Quarterly's" plan of forming a hedge by cutting down Quicks quite close, and mixing them with Beech, and I may add that the shade and noxious drip of the latter would, probably, kill the shoots of the former as they spring up. Having planted during the last 36 years many, many miles of Quick fences, and tried various modes of doing it, I have found the following plan most successful. I make a trench about 2 feet wide and 2 feet deep, and border it with one clod on each side, and cast into it the best of the soil taken out of the ditch made 2 feet wide on one side and manure it. I then place Quicks, three or four years transplanted, in two rows (each 8 inches from the clod), and each plant 9 inches from, and sloping at an angle of 45° towards the next in the row, and zig-zag with the Quicks in the opposite or parallel row. On this plan the new shoots, when breaking out, spring upwards, and making angles with the stems soon supply a great width of fence, and form a sort of natural pleaching. Towards winter, or in spring, before the new buds push out, I cut the top of the fence, lowering it to about 2 feet high, and trim up the sides from the bottom into a wedge-edge at the top, by which the whole side of the fence is exposed to the sun and air, and no gaps can be formed below by the over-hanging and drip of projecting branches above. At the same period I weed the fence, and, if requisite, water it with liquid manure. I trim the fence every year, keeping it finally at the height of 4 or 5 feet. I put up, at 4 feet outside of each clod of the fence, posts (not morticed) with three rails, or four towards a road, fastened with T nails; and in two or three years I widen the ditch to 3 feet, casting the best of the soil into the trench with the Quick. I always season my posts and rails, as well as timber for other purposes, by placing them for a fortnight or three weeks in the lime-pit, of which you inserted the particulars in the *Gardeners' Chronicle*, July 9, 1853. I think I adopted this plan from a statement in the "Edinburgh Quarterly Journal of Agriculture," 1828, giving an account of its successful

PLAN OF FENCE.

ELEVATION OF FENCE.

practice at Closeburn Hall, Dumfries, by the late Sir Charles Menteith; and my carpenters have been much struck with the hardness and density imparted by the process to the softest woods during the two last years, when it has been in constant use. *L. A. Lloyd, Leaton Knolls, Shrewsbury, May* 30.

The Weather during the month.—The following is a return of the minimum of my self-registering thermometer (seven miles south-east of York, Lat. 53° 54′, Long. 0° 57′ west, about 28 feet above the level of high water in the adjacent river Derwent; thermometer 5 ft. 6 in. from the ground, outside a window facing north-east), during most of the nights, up to this day (May 30) of this unusually cold month. You will observe that during no night has the decimal figure been 5; that on nine it has been 3, and on three 2!

Greatest cold of the preceding night.

May	2	35°		May 13	33½

"	12	34		" 30	36

The thermometer is examined in the morning, and the greatest cold is that of the night preceding the day entered. I will add, with reference to the cold season, that the Blackthorn was nearly a month later than its usual time of flowering, and the swallows, like wise birds, deferred their arrival for about the same period. As I am writing, I will take the opportunity of asking your advice respecting the transplanting of an Araucaria imbricata, which I wish to remove, at the time you may recommend, a few yards from its present position; and I am anxious to take every care of it from its having been presented to me by a gentleman now no more. The soil is a good hazel loam, and I have at command leaf-mould, sharp sand, and bog-earth from an ancient wood, should you think it desirable to make a compost of these materials. The plant is 2 ft. 7 inches high, and the tips of most of its branches have suffered from the late severe winter. *A Ten Years' Subscriber.* [Dig, with a draining spade, a narrow trench round your Araucaria, about 2 feet deep, and far enough off the stem not to cut through more than the ends of the roots. Fill up the trench with leaf-mould and sand, or sandy loam. Leave the plant till September, then transplant it carefully, and you will find the trench full of fine new roots, which will not easily break off in the lifting.]

Mushrooms.—West of Hereford, a great crop of Mushrooms sprang up in the fields last week, during the few warm days. *C., May* 30.

Societies.

Caledonian Horticultural, *May* 12.—On this occasion prizes were awarded as follows:—To Messrs. Dickson & Co., for four stove or greenhouse plants, the kinds being Calceolaria violacea, Azalea Fioni, A. phœnicea alba, and Bossiæa linophylla. To Mr. Lockhart, gr. to R. Dundas, Esq., for Tetratheca verticillata, Pultenæa stricta, and P. subumbellata; to Mr. Ritchie, gr. to A. Duncan, Esq., for Boronia tetrandra, Aphelexis speciosissima, and Adenandra speciosa; to Mr. Cameron, gr. to S. Hay, Esq., for Rhododendron aureum hybridum; to Mr. Lockhart, for Erica elegans and mutabilis; to Mr. Ritchie, for E. ventricosa, coccinea minor, and perspicua nana; to Mr. Lockhart, for a trained plant of Torenia asiatica, 3 feet 6 inches high by 2½ feet broad; to Mr. Cameron, for Azalea magnifica purpurea and lateritia alba; to Mr. Pender, gr. to D. Anderson, Esq., for Triumphans and Gledstanesi excelsa; to Mr. Ritchie, for Optima and Phœnicea; to Mr. Cameron, for Duke of Devonshire, Coronata, and Liliiflora. To Mr. Reid, gr. to W. Wilson, Esq., for well-grown plants of Cinerarias Bessy, Queen of Beauties, Lady Hume Campbell, and Climax; to Mr. Walker, gr. to J. Moody, Esq., for Angelique, Lady Gertrude, Cerito, and Lady Hume Campbell. To Mr. Walker, Rosehall, for Auriculas Fletcher's Mary Ann, Leigh's Colonel Taylor, Taylor's Glory, Fletcher's Ne Plus Ultra, Lightbody's Star of Bethlehem, and Lady Ann Wilbraham; to Mr. Woolley, gr. to C. M'Laren, Esq., for Morning Star, Taylor's Glory, Rule-all, Ruler of England, Oliver's Lovely Ann, and Conqueror of Europe. The prize of one guinea, offered by Messrs. Dicksons & Co., for the four newest and best Indian Azaleas, was awarded to Mr. Pander, for Optima, Praestantissima, Lateritia superba, and Liliiflora. A Certificate was granted to Messrs. Cunningham, Fraser, & Co., for Viburnum macrocephalum in profuse bloom. Mr. Stark sent a basket of rare Ferns, with Viola palmata and Primula capitata in flower. From Mr. Handasyde came a basket of the new Coniferæ and other ornamental trees and shrubs, including Berberis japonica intermedia, new gold-leaved Ivy, Thujs gigantea (or Libocedrus decurrens), T. plicata, and Pinus Parryana. Mrs. Carstairs had a bunch of Grayson's Giant Asparagus (25 heads) weighing 27 oz. From the garden of Sir W. Gibson-Craig, Bart., were Dodecatheon californicum in flower, and a variegated variety of Picea Webbiana. From Mrs. Fraser, Canonmills Cottage, good specimens of Alpine plants, including Arenaria balearica, Draba pilosa, with Trillium grandiflorum and Athyrium Filix-fœmina var. crispa. From Mr. Sirling, Moray Park Gardens, Viola palmata, Ajuga pyramidalis, Hutchinsia stylosa, and other Alpine plants. The exhibition was enhanced by some fine plants from the Society's garden, including the sweet-scented Rhododendron Edgworthi, R. Gibsoni, glaucum, and lepidotum.

Notices of Books.

Practical Meteorology. By John Drew, Ph.D., F.R.A.S. Van Voorst.

This little volume, which professes to teach "how to observe" meteorological phenomena, is stated by the author to be the result of seven years' experience as an observer and student. The work consists of three parts: the first, which is introductory, is on the laws of heat as affecting atmospheric changes; the second contains descriptions of instruments of observation, deductions from observations on the thermometric, hygrometric, barometric, and electric condition of the air; the third part relates to the present state of meteorological science in England; and an appendix contains various useful tables for meteorological calculations.

In the first part, the composition of the atmosphere, its mechanical properties, weight, and elasticity, the laws of heat, expansion, conduction, good and bad conductors, reflection, latent and specific heat, evaporation, &c., are all explained in much the same way as they usually are in elementary treatises on such subjects. The construction of thermometers is well given. The principle of their action, viz., the expansion of mercury, alcohol, or other substance, is generally known; but "to adapt a correct scale to the thermometer is a matter of the utmost consequence. The civilised world

has agreed on fixing two points on the scale; viz., that to which the mercury rises when the instrument is plunged in boiling water, and that to which it descends when placed in melting ice. The space between these points is not, however, divided by all nations into the same number of equal parts," there being 180 according to Fahrenheit, 80 Réaumur, and 100 according to Celsius, or the Centigrade scale. "The first point to be determined is the freezing-point of water, which is the same under all temperatures, and every variety of barometric pressure, provided the water is free from salts of every kind. The thermometer tube—not the bulb only—is plunged into melting ice" [it would have been more explicit to have said the bulb and likewise the tube of the thermometer are plunged into melting ice], "and a mark is made across the glass of the tube at the point to which the mercury sinks or withdraws towards the bulb: this is the zero-point of every scale except Fahrenheit's. It is a remarkable fact that this zero-point is not permanent; when thermometers have been made for some time a very perceptible difference is found between the point to which the mercury descends and the original zero of the scale; hence the necessity of determining it anew from time to time, and applying the difference as an index correction. Mr. Sheepshanks, who did not desist from his labours in the structure of the thermometers used in connexion with the experiments to determine the length of the national standard yard, till he felt assured of being able to reach the second decimal of a degree, used ice found in tubs of rain-water, in which the thermometer was placed horizontally, and the intersection of the mercurial column with the tube was read off by a vertical telescope carrying a wire moved by a micrometer screw; he obtained identical results when he made use of newly fallen snow; and he recommends the determination of the zero to be performed in winter when the air around is but little above the freezing point, and the ice or snow melts but slowly."

We would direct especial attention to the preceding paragraph; for, although it may be true that gardeners do not require instruments of such extreme nicety as those adjusted by the gentleman above mentioned for a particular purpose, and although, on the contrary, tolerably good common instruments answer their purpose, yet we know that common thermometers are more especially liable to vary from the truth, even if they were originally in accordance with it; it therefore becomes necessary that they should be occasionally examined; and any one who chooses can do this, in the way pointed out by Mr. Sheepshanks, sufficiently exact for most purposes without the telescope and micrometer screw.

Various kinds of maximum and minimum thermometers are described and illustrated. Of Sixe's Register Thermometer it is said:—"Unfortunately this elegant instrument can hardly be trusted for very nice observations, and is very liable to get out of order. Rutherford's Register Thermometer, or rather thermometers, for his registering maximum and minimum ones are quite distinct, acting independently of each other, are, for the sake of more elegant appearance, generally both fixed on the same plate of box-wood or metal." We, however, prefer to have them separate, for this reason —if one gets out of order, it can be put right without disturbing the other; but when fixed on the same scale, if one wants repair the other (although acting perfectly well) must accompany it, and, not unlikely, returns disordered by the journey. "After reading off, and to prepare the instruments for future observations, both indices are brought to the extremities (the one of the column of spirit, the other of that of the mercury,) by gently inclining the plate on which the thermometers are fixed, downward from the horizontal position. This must be done with great care, or the indices will get entangled with the liquids, from which they will be with difficulty extricated. For three years the author has used a register thermometer of this description without any mishap whatever, though he ruined a great many before he discovered the very careful treatment they required."

We have had long experience of Rutherford's thermometer, and, improved, perhaps they are the best for the purpose of registering. The steel index is apt to get entangled in the mercury. To prevent this, Mr. Newman has introduced a small bit of enamel between the two, so that they cannot come in contact; but whether the instrument be furnished with this or not, the index should be drawn back by a magnet, so that the thermometer need not be turned up at all. A small horse-shoe magnet, 2 or 3 inches in length, will be sufficient, and we avail ourselves of this opportunity of strongly recommending to our readers the adoption of this mode of bringing back the index of a mercurial thermometer.

Negretti and Zambra's Maximum Thermometer, and also one by Professor Phillips, are described in the work before us. These have no indices to get out of order, but we have not proved their accuracy, which indeed appears from their principle of action to be very doubtful.

We must refer the reader to the book itself for information respecting the modes of registering observations, the position of instruments, climate, &c. General considerations on the hygrometric state of the air are followed by descriptions, with plates, of different kinds of hygrometers, some of which have been invented for obtaining the dew-point by direct observation; three of these are described, namely Daniell's, Regnault's, and Connell's. The last two are too complicated for general use. Daniell's, on the contrary, is comparatively simple, and might be usefully employed in horticultural practice.

We have at p. 227 of the work an account of the recently discovered principle in the atmosphere called ozone, the nature of which is not however perfectly understood. It has been found that it combines energetically with deleterious gases, and neutralises their effects. Schönbein, who discovered it, has proved by experiment that air containing $\frac{1}{6000}$ of ozone can disinfect 540 times its volume of air produced from highly putrid meat; that is to say, such a fœtid atmosphere may be completely purified by a quantity of ozone equal to $\frac{1}{3240000}$ of its volume. "Now, in bad localities, it is evident that we may expect the test to show little or no ozone, while, as Faraday found at Brighton, the pure air from the ocean abounds with it. Schönbein met with it in abundance during a storm on the Jura, and could even recognise its smell; so that the purification of the air by storms would seem now to be philosophically proved. The electric discharge, of which thunder and lightning are the sensible indications, produces in large quantities this valuable disinfecting agent." What effects its presence in greater or less quantity in the atmosphere, or its total absence, may have on animal and vegetable life remains to be ascertained. From an excellent abstract of results of a meteorological table, kept at Uckfield, Sussex, by C. Leeson Prince, Esq., with which we have been favoured by that gentleman, it appears that in the unhealthy month of last August, the mean amount of ozone was comparatively small.

Our limits do not permit us to allude further to the many subjects treated of in the work before us; we therefore recommend those engaged in meteorological pursuits to the book itself, which will be found well worth perusal.

Garden Memoranda.

Horticultural Society's Garden, Turnham Green.—Except in a few particular cases, such as that of the Mexican Pines — apulcensis, macrophylla, Teocote, Devoniana, Russelliana, and patula—which have either been killed altogether, or suffered most severely, the garden has now apparently quite recovered from the effects of the extraordinary winter and spring we have experienced. Many of the ornamental trees and shrubs in the arboretum are now in full blossom. The different kinds of Lilacs are at present in perfection, Horse Chesnuts are blossoming profusely; the various varieties of Pyrus, and some Cratæguses, are in full beauty, as are also a few of the earlier Azaleas and Rhododendrons; but the great mass of the latter, as well as Laburnums and scarlet-flowering Thorns, are not yet in flower.

The large Glycine sinensis on the conservative wall and the white variety of this charming wall plant in another part of the garden are at present both in full blossom. The latter appears to flower quite as profusely as the blue kind, with which it forms a good contrast. The freedom with which these plants are blooming this year may be attributed to their young wood having got thoroughly ripened last autumn, which it will be remembered was very warm and dry.

The rocky banks of the American garden are now gay with masses of Iberis gibraltarica, Alyssum saxatile, Ajuga reptans, different kinds of Squills, Phlox setacea, and Aubrietia deltoidea, &c., all of which are in full bloom; and these will be speedily followed by Dianthus suavis and other plants of that description, which so eminently serve to keep such places gay in spring and early summer. The double flowering bluish lilac Rhododendron fastuosum is likewise now in flower here; but with the exception of this and Ledum palustre, the great mass of the American plants will not, as we have already stated, be at their best for some time yet. Other shrubs in flower here were Spiræas chamædrifolia and prunifolia; Ceanothus verrucosus, which has wintered safely, while C. papillosus and dentatus have been much cut up; Berberis Darwini, the common purple-leaved Berberry (B. vulgaris purpurea), and Lonicera punicea, a crimson-flowered shrub of considerable beauty; on a wall the white Atragene alpina is at present very ornamental, as is also Clematis montana, which flowers so profusely every year about this time.

On a border outside the American garden, some common purple flowering herbaceous Pæonies were in bloom; these are grown here for the purpose of furnishing stocks for Moutans, for which they are well adapted, the latter when grafted on them succeeding perfectly, and making good plants. Of Moutans, Mr. Fortune's fine kinds are now in flower, and extremely handsome they are. The darkest among them is atrosanguinea, a deep crimson variety, and atropurpurea is also a valuable dark purple kind. Versicolor is a large showy changeable purple; picta is a fine rosy salmon, and salmonea and parviflora are also salmon-coloured sorts. All these must be regarded as valuable introductions to English gardens.

In the greenhouses, which are gay with Schizanthus violaceus raised from seeds sown last August, Calceolaria angustifolia, rugosa, and Ajax, the last a showy yellow kind with a large deep orange brown spot, fancy and Cape Pelargoniums, Cytisus, and other shrubs, we remarked the double yellow or rather buff Datura, quite a curiosity in its way, and the pretty double white flowered Clematis Sieboldi, a free flowering species which can be kept within small bounds, and is a very ornamental plant for common purposes.

In the Rose house the different varieties will soon be covered with flowers; Fortune's yellow, a climbing sort, is already very showy, and some of the other kinds are beginning to expand their flowers. All of them have made most satisfactory growth and are literally loaded with flower-buds. The bushes too are quite clear both of aphides and mildew, the latter having as yet been prevented by dusting sulphur liberally over the plants in winter and early spring.

In the great conservatory both the red and white Brugmansias are just in perfection; the latter more especially is one mass of large, sweet scented, trumpet-shaped flowers. Among numbers of other plants likewise in blossom here we remarked a hybrid Aquilegia, a cross between the Scarlet Californian kind and A. fragrans. It appeared to be a stronger grower than either of its parents, from both of which it differed in colour, being purple and yellow, and very handsome. It will, therefore, doubtless be found a good addition to this class of plants.

Among novelties we noticed a fine stock of Tecoma velutina, which has been raised from seeds sent from Guatemala by Mr. Skinner. It is said to be a handsome yellow flowered shrub. Dolichos luteus has also been raised plentifully from seeds, as has also the Bahama Palmetto, which, however, is not likely to be as hardy as the Chusan Palm. Statices, Cobæas, and many other recently imported seeds, have likewise germinated freely.

In the orchard house the different little trees in pots are bearing full crops. Peaches, Nectarines, Plums, Cherries, and Figs are loaded with fruit, and even Currants and Gooseberries are swelling abundantly, and altogether this plan of fruit growing promises to be satisfactory.

In the Orchard, Pears and Apples, to all appearance, will be a good crop this season, more especially on standards, which have apparently suffered less than dwarfs. Some of the blossoms of Cherries and Plums have been injured; but it is thought that there may still be enough for the trees to carry. On walls Pears look well, and so do Peaches and Nectarines; the latter are clean and very clear of aphides, which are kept in check by powdering the parts affected with tobacco dust. It is applied with a pair of bellows, on whose tube or nozzle is fixed a little canister with a perforated bottom, which allows the dust to pass into the nozzle, out of which it is blown on the trees. This operation is performed when the trees are wet, which causes the tobacco dust to adhere to them. The latter is made of home-grown Tobacco leaves dried, powdered, and sifted, and is found to answer the purpose better than tobacco water.

Potato Yams (Dioscorea) are now being planted out. The stems are not supported on sticks; but are allowed to creep on the ground. In short they are managed very much in the way in which ridge Cucumbers are treated.

FLORICULTURE.

Pompon Chrysanthemums.—I will say but little about the cultivation of these, as the general culture of the large-flowering kinds is equally applicable to this small class; a few cursory remarks are therefore all that are necessary. About April select good suckers or cuttings from the old plants, giving the preference to such as appear stout and short-jointed; put one in a pot, say a 3-inch one; mix together a good rich soil, taking equal proportions of loam, rotten dung, and leaf-mould, to which may be added a sufficiency of rough sand to make the whole porous. When potted, put them in a house or frame, and keep them close for some time, say three weeks, by which period most of them will be well rooted; then gradually harden them off, and about the middle of May give a shift into larger pots, say 5-inch ones; after which place them in the open air, in a situation sheltered from the easterly winds, and at a sufficient distance from each other to admit of free circulation of air. About the middle of June give them their final shift into 8-inch pots, using the same compost as before; they should then be plunged in an open border, where they can receive the full influence of the sun, two-thirds of the pot being buried, and placed at from 2 to 3 feet apart each way, which allows plenty of room for watering, tyeing, &c., and attention must now be paid that a liberal supply of water be given as occasion requires, for if the plants are allowed to get too dry, besides receiving an unnatural check, they will lose a portion of their foliage. Care must now be taken to continually top them, as the plants will grow very fast and luxuriantly; their first topping should take place when about 4 inches high, and be repeated until July or August. One great feature worthy of remark in the Pompon varieties is, that they can be constantly topped until a much later period than the large-flowering kinds, without retarding or diminishing their blossoms; thus they are easily made into handsome and ornamental specimens, and when covered with their innumerable beautiful double Ranunculus-like flowers, they may be truly said to be perfect little gems. Before the blossoms expand, the plants may be taken from the ground and removed to the greenhouse, which will be of great assistance to their development; no check will be experienced by the removal, if plenty of water be given them. I had nearly forgotten to mention one very beautiful characteristic of these Lilliputians, which is, that they blossom much earlier than any of the other kinds, thus obviating the great complaint against Chrysanthemums when grown in the open borders; namely, that

the frost destroys the plants before the flowers have time to develope themselves. *W. B.*

SEEDLINGS.

Calceolarias: *J W & Co.* 1 is the best, but both may make good bedding sorts.

Pansies: *B H.* A yellow ground variety, with very dark top petals and margin. It should be double its present size, and then it would be no better than many already out, being of a class in which we abound in good kinds.

Polyanthuses: *J W.* A large, and to all appearance, a very good flower, but too much pressed in the transit for us to fully judge of its merits.

Miscellaneous.

On the Diseases of Plants: by M. F. E. Guerin Meneville.—Some observations recently made tend to confirm an opinion expressed last year to the effect that the great epidemic from which so many plants, and Vines more especially, have been suffering, is due, if not solely at least principally, to influences of temperature. The observations upon which this opinion was based have become during this last year very numerous, and have been made in the departments of the Var, Bouches du Rhône, Basses-Alpes, Vaucluse, Gard, Drôme, Ardèche, Isère, &c. After having examined the epidemic in the Basses-Alpes during the whole time that the silk-worms were hatching, I determined to extend my inquiries to the ten departments just named, proceeding from the south northwards. I thus ascertained that the disease disappeared not only, as I had formerly ascertained, in proportion to the height of the plants above the sea, but also in proportion to their northern situation. Neither in the Alps nor in Paris was there any disease. In the Alps, as in Paris, the disease, when it existed at all, was only to be found on plants sheltered by walls and exposed to the south or east, or on plants in small town gardens where, in consequence of the artificial atmosphere, the disease made its appearance whatever aspect the plants had. I noticed it principally in fields of Saintfoin, on cereals, Melons, Gourds, Tomatoes, &c., Vines, Roses, Mulberries, Walnuts, and other fruit trees, and even on the Alders in our valleys. The Saintfoin, for example, after progressing admirably from December to February, languished, and became covered with Oidium to such an extent that the strong smell of diseased Vine which it emitted when being cut, caused alarm, lest the crop should prove injurious to cattle fed upon it. All the corn, and especially that on well exposed hills, looked admirably at the same period of the year when vegetation ought to have been stationary, and the plans perhaps covered with snow; but the corn in the plains, in the large valley of the Durance, as well as that of the higher land in the department, remained small, low, and exhibited no unusual development. Later, during the months of April, May, and even June, the corn on the hills with fine aspects, and which was already in ear and about to flower, became exposed to a low temperature and a cold damp; the plants became covered with rusty black spots, their leaves curled, and in spite of incessant cold rain, appeared to suffer from drought. The corn in the plain, in cold soil, with harvests almost always a fortnight late, developed slowly, and as usual; the bad weather had no effect on it, and the harvest was good, whilst the corn on the hills and intermediate lands, although so fine in December, January, and February, did not even yield the seed from which it sprung. A curious circumstance, showing that the disease of the corn is due to a too high winter temperature, is that all those growers who sowed their corn late had fair crops. The Mulberry trees were out early and exposed to all those cold rains which destroyed the early silkworms. Some of the trees were seen in full leaf as early as Easter. Later, all the leaves became covered with rusty spots, which I examined with great care. In some cases the disease was so bad that the leaves curled up and dried, and became utterly useless as food for silkworms. Walnut, and many other trees were just as bad, their leaves also being covered with rusty spots. The Vine was worse than ever. The cold rains of May caused the disease to appear a fortnight late, and this gave some hopes that the malady had, if not disappeared, at all events greatly decreased; but it soon appeared that the plants were seriously affected, more so even than in the preceding years. Nevertheless such was the variety of circumstances under which my observations were made that I was able to ascertain by examinations, as well on a large as on a small scale, that my theory of caloric influence explained every phenomenon satisfactorily established. Thus it appears quite certain that all valleys having large streams of water, and so situate as to be exposed during winter to cold northerly winds, are more or less free from the ravages in question. The north slopes of hills are generally free also, and certain elevated tracts of country, whether in the south or middle of France, suffer but little, unless it be in those spots which are sheltered by irregularities in the soil. *Comptes Rendus.*

Calendar of Operations.

(*For the ensuing week.*)

PLANT DEPARTMENT.

Conservatory, &c.—As soon as cold frames and pits can be got cleared of bedding stuff they should be occupied with young stock of hard-wooded plants. These humble structures will also be found suitable for dwarf Lobelias, Balsams, Salvias, and many other things which are generally grown for flowering in the conservatory in summer and autumn. Roses, as was stated last week, are perhaps the most generally admired of all winter flowering plants, and where there is not a stock of established plants for this purpose, if a lot of young plants can be procured and placed in a frame they will make nice stuff by autumn if properly attended to, especially if the frame can be placed on a bed of leaves or tan to afford a gentle bottom-heat, which will greatly assist in inducing a vigorous root action. Now that the weather has become milder, air should be given more liberally, and when there is no danger of frost, a little back air may be left on for the night. Attend to former directions as to keeping insects under, and supplying beds and borders liberally with water.

Greenhouse.—If any of the young stock has not yet been examined for the purpose of ascertaining whether it requires more pot room, this should be done the first possible opportunity, repotting such as require it, and a liberal shift may be given with propriety at this season to things in a vigorous state. Great care should be used, however, to have the balls in a nice healthy state as to moisture, and also the soil to be used; and the plants should be exposed as little as possible to sunshine, or drying currents of air, for a fortnight or so after potting. Careful and judicious watering is at all times essential to successful plant growing; but at no period of a plant's existence is this so important as while the roots are surrounded with fresh soil, and many a promising plant has been ruined by one or two inadvertent applications of water while in this state. If both the ball and soil are in a properly moist state when potting is performed, water need not be given for two or three days; and when it is deemed necessary to water, enough should be given to thoroughly soak the whole of the soil. Large specimens of Heaths and other hard-wooded things must also be very carefully supplied with water, and every precaution should be used to make sure that the ball is in an equal state as to moisture throughout; for it sometimes happens that the surface of the ball will appear quite wet, while below (where the greater part of the roots is) is too dry. This is the result of practising the dribbling system of watering, and is not likely to occur where watering is done properly. The readiest and safest way of moistening the lower part of the ball, when this is found to be dry while the upper part is wet, is to place the pot in a saucer or tub of water for a few hours, letting the water stand about an inch above the drainage.

FLOWER GARDEN AND SHRUBBERIES.

The weather is extremely unfavourable for trees and shrubs that have been recently shifted, and these should be frequently examined, to see that they are not suffering through dryness at the root; and when watering is deemed necessary, have the surface loosened with a blunt pronged fork, giving a thorough soaking, and then mulch to prevent rapid evaporation. Young things which have not got fairly established since planting must also be attended to with water as they may seem to require it, until they get proper hold of the ground. As to planting out the bedding stock the weather has been such this week that those who have not commenced will not regret having their plants where they can be afforded some shelter, and at present there is no appearance of any change for the better. It is of course needless to advise parties to defer planting out until the change comes, for to plant out in the present state of the weather would be about as reasonable as to do so in March; and it is to be hoped that any advice as to the management of the stock until it can be committed to the ground will be too late, for surely the present winterly weather will not last many more days. We have kept our stock as close as circumstances would admit, covering that in skeleton frames with mats, &c., and shading that under glass, and giving very little air, which has been a great saving of labour in watering, and the plants have no doubt suffered less than if they had been exposed to the drying winds. What the effects of the present week will be upon things that were planted out remains to be seen; but they will, doubtless, have sustained a very serious check, and will require much attention to get them round in any reasonable time. Meantime they must not be allowed to get too dry at the root; but watering should be done in the morning, so as to have the surface of the beds dry before night, for a sharp frost is probable enough any night. But when warm weather comes, things that have suffered from the winds should be sprinkled every evening with water that has been exposed to the sun, and a good watering given as often as may be necessary to keep the beds moist; and they should also be shaded from bright sunshine, by sticking plenty of evergreen branches into the beds. There is a very sensible article on bedding plants by Mr. Ayres in last week's *Chronicle*, to one part of which we beg to direct attention, and advise parties to adopt the plan there recommended for storing heat in the ground before planting out the bedding stock, which is worth the trouble any season, and much more so this, when the ground is so unusually cold.

HARDY FRUIT AND KITCHEN GARDEN.

Trees that have been shifted this season must be attended to with water, and see that standards are securely fastened against the wind. Continue the war against all kinds of insects, particularly green-fly on Peach trees, and do not allow these pests to injure the young shoots, for they are already very late, and unless the season should prove very fine indeed there will probably be some difficulty in getting the young wood ripened before winter, and every care should be used to prevent the trees sustaining any check. We find that shallow light borders are already inclining to dryness, and should the weather become warm before we have a good soaking of rain it will probably be necessary to water where the borders are shallow and of a dry nature. But watering in the present state of the weather would probably do more harm than good. Strawberry beds should be carefully cleaned, loosening up the surface, and thoroughly soaked with pond water first warm day, giving a good watering with manure water a few days after the ground has been well soaked, when it will be more useful than if given while the ground is in a dry state. Attend well to Cauliflowers and other crops with water. See to keeping up a succession of Kidney Beans, Turnips, Spinach, &c. In putting in seeds at this season when the ground is in a dry state the drills should be well watered before sowing.

STATE OF THE WEATHER AT CHISWICK, NEAR LONDON,

For the week ending May 31, 1855, as observed at the Horticultural Garden.

May 25—Fine; cloudy and fine; very fine.
— 26—Very fine; very hot and dry; fine; windy at night.
— 27—Dry haze; overcast; cloudy; slight rain.
— 28—Rain; cloudy and cold at night.
— 29—Cloudy throughout; showery at night.
— 30—Low clouds; cold showers with northerly wind.
— 31—Cold rain; cloudy at night.

Mean temperature of the week 2½ deg. below the average.

RECORD OF THE WEATHER AT CHISWICK,

During the last 29 years, for the ensuing week, ending June 9, 1855.

June.	Average Highest Temp.	Average Lowest Temp.	Mean Temp.	No. of Years in which it Rained.	Greatest Quantity of Rain.	Prevailing Winds. N.	N.E.	E.	S.E.	S.	S.W.	W.	N.W.
Sunday 3	70.5	45.3	57.9	11	0.91 in.	—	3	4	1	5	9	3	4
Mon. 4	70.7	46.0	58.3	11	0.76	1	5	2	2	3	7	5	4
Tues. 5	70.3	47.1	58.7	15	0.64	2	4	2	1	5	6	6	3
Wed. 6	68.2	47.4	57.8	14	0.28	5	4	1	2	3	9	2	3
Thu. 7	68.0	47.5	57.8	11	0.53	3	6	0	3	4	6	3	4
Frid. 8	70.0	47.1	58.6	11	0.45	3	6	1	0	4	9	4	2
Satur. 9	70.3	48.2	59.3	13	1.48	1	5	1	2	3	11	3	3

The highest temperature during the above period occurred on the 7th, 1846—therm. 90 deg.; and the lowest on the 3d, 1837, and 8th, 1838—therm. 35 deg.

Notices to Correspondents.

Ants: *A L.* We are unable to advise you. If you can find their run stuff rags dipped in turpentine or gas tar into the holes, or pour them in. As to killing them by catching, it is a hopeless task. Of course you must not put turpentine or gas tar into the pots.

Arum: *A S L M.* This, like all such plants, is easily extirpated by handpicking the leaves as soon as they are a few inches long in the spring: and again picking them as fast as they reappear. It must be a very large park that would not be quickly cleared thus by a few women and children. Even now there would be an advantage in pulling up all the leaves and Lords and Ladies that can be found.

Asparagus Broccoli: *M W.* We do not recognise this. Could you not send a plant to the Horticultural Society, 21, Regent Street, with a request that it may be planted and reported on?

Cauliflower: *J M.* Certainly your plant will be ruined by every Cabbage or Broccoli that may be in flower within a mile of it, unless you prevent the access of pollen brought by wind or by bees and other insects. A shirt of muslin drawn over the plant will probably preserve it from contamination if tied close round the stem, and put on before any of the flowers have opened.

Diseases: *E E.* There seems to be nothing wrong about the Vine leaves, except that perhaps they are too luxuriant. The young bunches were so much injured by pressure as not to exhibit their natural appearance. We have never seen such an affection before. If you will send by post two or three in a strong box, with a leaf to keep them fresh, directed Rev. M. J. B., King's Cliffe, Wansford, we will examine the matter more minutely.—*H W.* There is no fungus on your Vine leaves. The little warts upon them are very common, and arise from some bad condition of the roots. At least a set of Vines in pots, which were affected last year, when the roots were in a very bad condition, are perfectly free now that the drainage of the pots is good and the roots healthy. *M. J. B.*

Insects: *J M.* The Pine plantations in Scotland are occasionally severely injured by the inclosed insects, which are the Curculio (Hylobius) abietis. Stumps of old trees and branches of felled trees left on the ground are the chief harbours and breeding places of those insects, and ought to be removed and destroyed. Some foresters recommend decoy-trees, that is, trees placed in open spaces and left for the attacks of these insects, which should be sought for on them from time to time, and destroyed.—*J G.* The Cherry leaves were infested by the larvæ of one of the leaf-rolling small moths (Tortricidæ), which were crushed on the post. The best remedy is to pinch sharply such leaves as exhibit rolls or cases of the larvæ, which are thus easily killed. *W.*

Names of Plants: We have been so often obliged to reluctantly decline naming heaps of dried or other plants, that we venture to request our correspondents to recollect that we never have or could have undertaken an unlimited duty of this kind. Young gardeners, to whom these remarks more especially apply, should bear in mind that, before applying to us for assistance, they should exhaust their other means of gaining information. We cannot save them the trouble of examining and thinking for themselves; nor would it be desirable if we could. All we can do is to *help* them—and that most willingly. It is now requested that, in future, not more than four plants may be sent us at one time.—*W Pass.* We believe the Cattleya to be the specimen of one sold under the name of C. Warczewitzi, but we are not certain. If not, we are unable to identify it.—*A* 1, Allium ursinum.—*T U V.* 1, Edwardsia chrysophylla; 2, Polygala speciosa; 2, Baptisia mollis—as far as we can judge from such fragments.—*Erzroum.* No box has yet arrived. We do Messrs. H. and Z. know anything of it.—*Amateur.* Campanula hederacea.—*E K.* Mitraria coccinea starved.—*P N.* 1, Monolopia major; 2, some Sisyrinchium not in flower; 3, Veronica chamædrys; 4, Asperula taurina.

Showing: *J G.* We see no reason why a double Wallflower should not be shown as a herbaceous plant.

Vine Roots in Air: *A Grape Grower.* You are undoubtedly wrong, and Mr. Grey is right. As to crops, that is not the question before us.

*** As usual, many communications have been received too late, and others are unavoidably detained till the necessary inquiries can be made. We must also beg the indulgence of those numerous correspondents, the insertion of whose interesting contributions is still delayed.

PERUVIAN GUANO, Bolivian Guano, Superphosphate of Lime, Nitrate of Soda, Sugar Scum, and every description of Artificial Manures, Linseed Cakes, &c.
WM. INGLIS CARNE, 10, Mark Lane, London.

GUANO (for Account of the Underwriters).—For Public Sale, at the New Corn Exchange Tavern, Mark Lane, on MONDAY, June 4th, at 2 o'clock precisely, by order of Messrs. ANTONY GIBBS & SONS, the Importers, ONE THOUSAND TONS OF DAMAGED GUANO.—Catalogues in due time from J. A. RUCKER & BENCRAFT, Brokers, 26, Commercial Sale Rooms, Mincing Lane.

FOR THE PRICE CURRENT OF MANURES.
NITRO-PHOSPHATE AND AMMONIA PHOSPHATE, manufactured by HODGSON & SIMPSON, Wakefield, and MATTHEWS & Co., Driffield, 8*l.* per ton.

PATENT SANITARY SEWAGE COMPANY'S NITRO-PHOSPHATED CARBON OR BLOOD MANURE, 5*l.* 10*s.* per ton; delivered in London, bags included. Each ton contains 1350 lbs. Blood and 11 per cent. of Phosphate of Lime.—Agents throughout the country.
22, Lincoln's Inn Fields, London.

THE FOLLOWING MANURES are manufactured at Mr. LAWES' Factory, Deptford Creek:—Turnip Manure, 7*l.* per ton; Superphosphate of Lime, 7*l.*; Sulphuric Acid and Coprolites, 6*l.*
Office, 69, King William Street, City, London.
N.B. Genuine Peruvian Guano, guaranteed to contain 16 per cent. of ammonia. Nitrate of Soda, Sulphate of Ammonia, and other Chemical Manures.

TURNIP SOWING.—The Undersigned beg to offer their valuable Supherphosphate of Lime (See "Royal Agricultural Society's Journal," Vol. VI., Part 2), Turnip Manure, and Nitro-phosphate or Blood Manure.
Also on sale, Guano, Nitrate of Soda, Gypsum, Bone-dust, Sulphuric Acid, Salt, and all other Manures of known value. Agents for the sale of Peat Charcoal.—Apply for Prices Current to MARK FOTHERGILL & Co., 204A, Upper Thames Street, London.

CORN MANURE FOR SPRING SOWING.
CONCENTRATED URATE FOR GRASS, RAPE, AND ALL ROOT CROPS.
SUPERPHOSPHATE OF LIME.
THE LONDON MANURE COMPANY continue to manufacture the above Manures, which have been used with so much success for the last 14 years.
The London Manure Company also supply PERUVIAN GUANO (direct from importers' warehouses), Nitrate of Soda, Sulphate of Ammonia, Fishery and other Salts, Bone Dust, and every artificial manure of known value. EDWARD PURSER, Sec.
Office—40, Bridge Street, Blackfriars.

SEWAGE CHARCOAL MANURE.—This highly fertilising Manure, which is Peat Charcoal completely saturated with London Sewage, will be found most efficient for every species of crop; more especially for Peas, Beans, Turnips, Mangold Wurzel, and other root crops. It will produce a greater return for the outlay than Guano or any other manure at an equivalent value: it also possesses the property of retaining its fertilising power longer than other Manures now in use. It may be obtained at the SEWAGE MANURE WORKS, Stanley Bridge, Fulham, at 4*l.* per ton, and in quantities less than half a ton, at 5*s.* per cwt., for ready money only; and in quantities not less than a ton will be delivered at the London Termini of the Railroads free of charge for cartage. No charge for sacks.
It may also be had from Messrs. G. GIBBS & Co., 26, Down Street, Piccadilly, Agricultural Seedsmen, Agents for London, and from all the other Agents of the Company.

ARTIFICIAL MANURES, &c.—Manufacturers and others engaged in making ARTIFICIAL MANURES may obtain every necessary instruction for their economical and efficient preparation, by applying to J. C. NESBIT, F.G.S., &c., Principal of the Agricultural and Chemical College, Kennington, London. Analyses of Soils, Guanos, Superphosphates of Lime, Coprolites, &c., and Assays of Gold, Silver, and other Minerals, are executed with accuracy and dispatch.
Gentlemen desirous of receiving instructions in Chemical Analyses and Assaying, will find ample facility and accommodation at the College.

COLLEGE OF AGRICULTURE AND CHEMISTRY, AND OF PRACTICAL and GENERAL SCIENCE, 37 and 38, Lower Kennington Lane, Kennington, near London.
Principal—J. C. NESBIT, F.G.S., F.C.S., &c.
The system of studies pursued in the College comprises every branch requisite to prepare youth for the pursuits of Agriculture, Engineering, Mining, Manufactures, and the Arts; for the Naval and Military Services, and for the Universities.
Analyses and Assays of every description are promptly and accurately executed at the College. The terms and other particulars may be had on application to the Principal.

TO ARTIFICIAL AND CHEMICAL MANURE MANUFACTURERS AND MANUFACTURING CHEMISTS.
MR. COOKE, CHEMICAL ENGINEER & MANUFACTURING CHEMIST, contracts for the erection of Sulphuric Acid Chambers and Chemical Plant generally on the most approved forms. Practical instructions from 12 years' experience in the trade given in the working of Acid Chambers, and in the manufacture of all kinds of Artificial Manures, Superphosphates, and Guanos. Receipts for the best mixtures furnished, and other information on application.—For terms, &c., apply by letter to 6, St. Thomas Terrace, Newcastle-on-Tyne.

THE LANDS IMPROVEMENT COMPANY, INCORPORATED BY SPECIAL ACT OF PARLIAMENT FOR ENGLAND AND SCOTLAND.—To Landowners, the Clergy, Solicitors, Surveyors, Estate Agents, &c.—Loans may be contracted for the execution by the proprietor or by the Company of every landed improvement, especially Drainage, Building, Clearing, Enclosing, Warping, Irrigation, Embanking, Reclamation, Roads, Planting, Machinery, &c. The plans (of buildings), specifications, and estimates are prepared by the proprietors, and are submitted to the approval of the Enclosure Commissioners. Proprietors may avail themselves of the powers of the Act to recover from the inheritance their own funds to be expended on improvements. They may also apply jointly for the execution of a general improvement, such as a common outfall, &c. For forms of application, &c., apply to the Hon. WM. NAPIER, Managing Director, 2, Old Palace Yard, Westminster.

GARDEN VASES, FOUNTAINS, ETC.
THOMAS SOMMERVILLE, LANDSCAPE GARDENER, NURSERYMAN, SEEDSMAN, and FLORIST, Garden Road, St. John's Wood, London, begs respectfully to inform the nobility, gentry, and his patrons generally, that he has entered into arrangements with an eminent company in Scotland for the sole disposal in London of their highly ornamental and very durable Vases, Fountains, &c., samples of which may be seen at his grounds in the Garden Road, as above.
He has much pleasure in being the first to introduce to the notice of the public a highly ornamental Vase, capable of resisting the most severe weather, and at little more than half the cost of any other possessing the same qualities; and he has no hesitation in stating that a more suitable Vase for the growth of plants cannot be manufactured.

WARNER'S IMPROVED LIQUID MANURE OR GENERAL PORTABLE PUMP.

The valve is a ball of imperishable material, and cannot clog in action. The barrel is of galvanised iron, not likely to corrode, and can be raised or lowered at pleasure. The legs will fold together, and the whole may be carried on shoulder to any pond or tank required.
Price of 4½ in. Pump, with legs, 3*l.* 3*s.* The barrel is 27½ in. long, and the legs are 5 ft. high.
1½ inch Gutta Percha Suction Pipe 1*s.* 6*d.* per foot.
1½ inch Flexible Rubber and Canvas Suction Pipe, 3*s.* 6*d.* per foot.
May be obtained of any Ironmonger or Plumber in town or country, at the above prices, or of the Patentees and Manufacturers, JOHN WARNER & SONS, 8, Crescent, Jewin Street, London.
Every description of Machinery for Raising Water, by means of Wheels, Rams, Deep Well Pumps, &c.; also Fire and Garden Engines, &c.—Engravings sent on application.

WARNER'S PATENT VIBRATING STANDARD PUMPS.
PATENT CAST-IRON PUMPS, for the use of Farms, Cottages, Manure Tanks, and Wells of a depth not exceeding 30 feet.

Diameter of Barrel	Length of Barrel, under nose.		£ s. d.
2½ in.	short 1 ft. 7 in.	Fitted for lead, gutta percha, or cast iron flanged pipe, as required.	1 12 0
2½ „	long 3 „ 3 „		1 15 0
3 „	ditto 3 „ 6 „		2 12 0
3½ „	ditto 3 „ 6 „		2 18 0
4 „	ditto 3 „ 6 „		3 5 0
2½ „	short, with 15 feet of Lead Pipe attached, and Bolts and Nuts ready for fixing		2 12 0
2½ in.	long ditto	ditto ditto	2 15 0

The short barrel Pump is very convenient for fixing in situations of limited height and space, for the supply of coppers and sinks in Wash-houses with soft water from underground tanks, or in Hot, Forcing, and Plant Houses; they may be fixed, when desired, under the stage.
May be obtained of any Ironmonger or Plumber in Town or Country, at the above prices, or of the Patentees and Manufacturers, JOHN WARNER AND SONS, 8, Crescent, Jewin Street, London.
Every description of Machinery for Raising Water, by means of Wheels, Rams, Deep Well Pumps, &c.; also Fire and Garden Engines, &c. &c.—Engravings sent on application.

JOHN WARNER AND SONS, Crescent, Jewin Street, London.
GALVANISED IRON TUB GARDEN ENGINE, WITH WARNER'S REGISTERED SPREADER,

is strongly recommended, for durability and low price, viz., 2*l.* 19*s.*, to hold 10 gallons.
Larger sizes in wood or iron, viz., 14 gals., 24 gals., & 35 gals. May be obtained of any Ironmonger or Plumber in town or country, or of the Patentees and Manufacturers, as also Machinery of all kinds for raising Water from any depth to any height by Steam, Horse, or Manual Power. Prices sent on application. Syringes of various constructions and sizes from 9*s.* upwards. Metallic String from 5*d.* to 1*s.* 3*d.* per lb.

JOHN WARNER AND SONS, 8, Jewin Crescent, London, Manufacturers of FIRE ENGINES, PUMPS, GARDEN ENGINES, and SYRINGES.

Brass Syringes, 9s. to 18s.

All articles of JOHN WARNER & SONS' manufacture may be obtained of any Ironmonger or Plumber in town or country, at the advertised prices.
JOHN WARNER & SONS having been practical Horticulturists for many years, know exactly the requirements of both Amateurs and Gardeners. A gardener with a properly constructed pump will get through as much work in five minutes as he could with any Syringe in a quarter of an hour, and with half the labour to himself. Syringes are economical for small houses.
No establishment offers such a variety of effective machines for hydraulic purposes, whether to supply Gardens, Hothouses, Cottages, Farms, Mansions, or Boards of Health, with every requisite connected with the conveyance and distribution of liquids.
Fountains suitable for Conservatories, Lawns, &c.
Sheets of Engravings sent on application.

BLACK JAPAN VARNISH.—This article will be found from its durability and cheapness of the greatest utility for Painting Hurdles, Wire-work, Palings, Gates, Fences, &c., and out-door work of every description, whether of Wood or Iron. Its value has been proved by the test of time. It should be well stirred up before using and applied cold. This Varnish will retain its quality for any length of time, provided the cask be kept closed.
May be obtained through any ironmonger; or of JOHN WARNER & SONS, 8, Jewin Crescent, London.
N.B. Sold in casks containing 28, or 14 gallons, at 2*s.* per gallon. Casks (which cannot be returned), 5*s.* each.

IMPROVED MOWING AND ROLLING MACHINE.

ALEXANDER SHANKS AND SON, Arbroath, Forfarshire, Inventors and Sole Manufacturers, respectfully solicit the attention of the Nobility, Gentry, and Gardeners to this Improved Machine for Mowing and Rolling Lawns. The Machine is in operation in the Royal Gardens at Windsor Palace, Buckingham Palace, and at Osborne, in the Botanical Gardens at Kew, Regent's Park, Manchester, Sheffield, &c.: at Blenheim Palace, Trentham, Cleveden, Elvaston, Broadlands, Woburn Abbey, Clumber, Lilleshall, Castle Howard, Shrubland, Eridge Castle, Enville Hall, Tiptree Hall, Chatsworth, and in many other of the principal gardens in the kingdom as well as in the United States, British America, and on the Continent, where its merits have been fully proved, and its success established.
The machine is made to cut the breadth of 42, 30, 20, and 15 inches respectively, is exceedingly durable, easily managed, and adjusted to cut to the length required. The execution of the work is far superior to what may be attained by the most skilful mower, while at the same time a great saving of labour is effected, and the turf much improved. By the largest machine a Scotch acre may be mowed, rolled, and the Grass collected in one hour.
A. S. and SON have much pleasure in stating that they have made considerable improvements in their 15-inch or hand machine this year, by which the draught is considerably lessened. This machine combines all the merits and advantages of the larger machines with firm and secure construction, and is admirably adapted for borders and for lawns of no great extent.
ALEXANDER SHANKS and SON also respectfully solicit notice to "Fleming's Weeding or Salting Machine" for destroying weeds in gravel walks, court-yards, drives, &c. This machine is now in operation in many parts of England, where it has given ample satisfaction as the best and most economical means of thoroughly keeping down weeds or Moss.
Further particulars, with testimonials and prices, may be had on application.

SAMUELSON'S REGISTERED LAWN MOWING MACHINES. To cut 16, 19, 22, and 25 inches wide. The Registered Improvement renders unnecessary the great care requisite in the handling of these Machines on the old plan. All that is now required can be done *by any unskilled labourer*, who has only to push the Machine before him, the Registered Adjustment insuring a clean cut of uniform height, and preventing the knives from cutting into the soil, however uneven the ground may be. Illustrated Price Lists, with copies of Testimonials, and a Catalogue of his other Agricultural Implements, may be procured, post-paid, on application to the Manufacturer,
B. SAMUELSON, Britannia Works, Banbury, Oxon.
The above may also be procured at the principal Agricultural Implement Depôts in London, and of all respectable Ironmongers and Seedsmen in the country.

CLAYTON, SHUTTLEWORTH, AND CO.'S PRIZE PORTABLE STEAM ENGINES, AND COMBINED THRESHING, STRAW SHAKING, RIDDLING AND WINNOWING MACHINE may be seen at their London Establishment, 6, Fitzroy Terrace, New Road, where all information relative thereto can be obtained. These Machines are constructed to horn Barley, and make a perfect separation of the chaff from the pulse. They are fitted with Elevators, which deposit the grain into bags, and beyond the feeder of Machine require no hands except to take away the Corn, &c., as threshed, the whole of the operations being performed by self-acting machinery, whereby the Corn, Straw, Chaff, and Pulse are delivered in the places assigned for them.
C. S. & Co. have paid special attention to this class of Machinery, and Fixed Barn Machinery, and from the position they have taken at the Royal and all the leading Agricultural Shows of England, flatter themselves that for efficiency, durability, and simplicity, their Engines and Machines are not surpassed by any other maker in England. All letters forwarded to the Works at Lincoln will have immediate attention; and Illustrated Catalogues forwarded to all parts of the kingdom postage free.

The Agricultural Gazette.

SATURDAY, JUNE 2, 1855.

MEETINGS FOR THE ENSUING WEEK.
WEDNESDAY, June 6—Agricultural Society of England.

THE effort made last autumn to collect the agricultural statistics, for the harvest of 1854, of the counties Hants, Wilts, Leicester, Norfolk, Suffolk, Berks, Worcester, Brecknock, Salop, Denbigh, and York (West Riding), by the union clerks, relieving officers, and other agencies under the superintendence of the Poor-law Inspectors in those counties, has resulted in the publication of a blue book in May, 1855, containing information of a very imperfect, and, therefore, unsatisfactory character. It appears that of 570,000 schedules issued to occupiers, barely 450,000 have been returned with the information asked; and of the remainder no fewer than 40,000 remain altogether unaccounted for, 82,000 having been filled up by the enumerators with information obtained independently of the tenants concerned. The counties of Berks (where of 4300 schedules issued 1800 were returned blank) and of Hants (refusing in upwards of 30 per cent. of its tenancies) are noteworthy as indicating the unpopularity of the proceeding: while Norfolk and the Welsh counties are remarkable for the completeness of their returns. The general impression on the minds of those who have superintended the experiment is, that the machinery employed is unsuitable, and that the voluntary plan of obtaining the information required is *necessarily* unsuccessful. The one view is illustrated in the cases in which boards of guardians have declined to undertake the labour proposed to them, and the other in the large number of refusals met with from individual tenants. The reports of the inspectors contain embodied in them extracts from numerous letters by tenant farmers and others, giving the grounds on which the ill success of the experiment is believed by the writers to rest, and stating their belief, in many instances, that an enactment rendering those returns compulsory upon the

tenantry, would be not only successful but much more popular. Mr. Caird, in a letter published in yesterday's *Times*, refers to this view of the subject, proposing, however, to make the matter compulsory only in reference to the acreage of crops. His plan suggests the employment of responsible officers, appointed specially for the purpose of collecting the returns and determining the character as well as the extent of the harvest.

The results of the present inquiry, such as they are, must be presented hereafter—though owing to their imperfect character and the late period of their publication they can be but of little value; and must afford the most unsatisfactory datum on which to build any such estimate of the whole produce of the country as is attempted to be deduced from them.

We resume the subject of fertility and barrenness in soils:

There is perhaps no form in which the force of climate so obviously appeals to observation as in the accumulation of bog and peat which in certain localities is due to it. The vegetable matter present in soils is one of the topics to which reference has been made in the enunciation of this subject. The necessity of its presence in some form and to some extent, in order to fertility, is a question rather for scientific investigation than for decision by the farmer. Mere agricultural observation would, however, confidently answer it in the affirmative, although to its presence in excess, and to the form in which it occurs, we must attribute the infertility of large districts in Ireland, Scotland, and in England. And around the edges of these districts will be found illustrations of the way in which this infertility is being overcome. The ordinary steps are drainage, levelling, burning the vegetation, Heath, and coarse Grass which occupy the surface, adding mineral matter—gravel, clay, marl, and lime; and then with the addition of some portable manure, and such rough cultivation as the first attempt amounts to, sowing or planting such crops as do not need a very fine tilth, to ensure a tolerable result. Thus Potatoes among green crops, or Oats among grain crops, are commonly first attempted. These are followed by Oats in the former case and perhaps Rape in the latter; and Rape is followed by Oats again, and the land is sown down with such Grasses as will suit a boggy soil. The following mixture is well adapted:

Agrostis stolonifera	3 lbs.
Alopecurus pratensis	2
Festuca pratensis	3
Lolium italicum	5
,, perenne...	8
Phalaris arundinacea...	2
Phleum pratense	4
Poa trivialis	3
Lotus major	2
Medicago lupulina	2
Trifolium repens	6
In all per acre	40 lbs.

In the course of four or five years the land becomes consolidated, and, after a dressing with lime compost, may be broken up for regular cultivation. The way in which (1) drainage and after drainage, (2) mere lapse of time, (3) earthen and calcareous dressings, and (4) cultivation overcome the infertility arising from peaty, boggy accumulations will be considered hereafter. The facts enumerated are all that agricultural observation can bear witness to; and on how large a scale they are visible in some counties has been abundantly recorded in our agricultural literature. In Lincolnshire especially extensive tracts which were formerly a waste of peaty bog and moor, a wilderness, as Mr. Clarke describes them, "of pools and bogs and reedy shoals," are now among the most fertile and productive districts in the kingdom. The fertility which these former wastes exhibit now may doubtless be attained elsewhere by the means which have been efficient there. What those means have been is admirably illustrated in the history of Deeping Fens. Between Spalding and Market Deeping, bounded by the Welland and the Glen, there are upwards of 20,000 acres of the lowest land in Lincolnshire. The particulars of its history are given by Mr. Clarke in the Journal of the English Agricultural Society. In the reign of Charles II. the first attempt was made to drain the district by means of windmills, the water being thus lifted out of the main drains. In the beginning of the present century an Enclosure Act was obtained, by which the north and south drove drains were cut. The fen was after this generally under water during winter, but in a tolerably dry spring the farmer managed to sow Oats by the end of April. When we were through this fen in July last the land was covered with heavy crops of Wheat, Oats, and Flax, with good Clover and Potatoes, and promising young Rape. Thirty years ago two steam engines, together of 140 horse-power, were erected at Podehole, near Spalding, the drains were deepened and the water lifted some 8 feet into the Vernatt's cut running into the Welland, a few miles below Spalding. The improvement of the outfall of the Welland would now enable the wheels at Podehole to be set somewhat deeper, so that, with the same lift, a drainage of the district could now be accomplished to a lower level than that at which it at present is. And how desirable this is, appears from the circumstance that the tenant of one of the farms in this fen has erected an engine and wheel especially for his own occupation, and by lifting from some 18 inches below the level to which the Podehole engines reduce the water he has obtained for the lowest of this land a drainage of 30 inches instead of 12. To drainage, marling, and subsequent spirited cultivation, the contrast between the present and the past of Deeping Fen is due. We are acquainted with one farm in this fen which has been in the hands of the same tenant since the erection of the Podehole engines. It is 680 acres in extent, the level of the lowest part of it is 6 feet below high-water mark, and its history, with most of which we are acquainted, is an illustration of the way in which fertility is attainable, notwithstanding excess of vegetable matter in the soil. When first occupied by Mr. Aitken the rotation adopted was 1st, fallow; 2d, Oats; 3d, Wheat; 4th, seeds; 5th, seeds pared and burned and sown with Rape in June; 6th, Oats; 7th, Wheat. In the course of a few years this was altered to 1st, fallow; 2d, Oats; 3d, Wheat; 4th, seeds; 5th, Wheat; the fallow being sown with Rape the first and second week in June, and fed off with sheep, commencing about the middle of September. The rotation that has latterly been adopted and followed now for some years, is 1st, fallow; 2d, Wheat, 3d, seeds; 4th, Wheat; 5th, Beans, Mangold Wurzel, or Flax; 6th, Wheat. And for keeping the land clean and in good condition it is much the best rotation of the three, The only inconvenience being that you are obliged to consume all the Rape early in the season to enable you to sow the land with Wheat. An average crop of Wheat is now fully 8 bushels per acre more than it was during the previous rotations; and this Mr. Aitken attributes to (1) not having two white crops in succession; (2) to under draining and *better* drainage by means of their own private engine; and (3) to an enlarged outlay for cattle food, 500*l.* a-year being spent on oilcake.

The soil of this farm 30 years ago was a light spongy peat, varying from a foot to 30 inches deep lying upon a subsoil of blue buttery clays, varying from this to a strong silty clay, with occasional beds of silt, and until clayed it was not adapted for Wheat culture at all, and from 30 to 40 acres sown in spring was all the farm could yield. But drainage has consolidated the peat, and by cultivation and burning it has wasted; and by the direct application of clay it has had substance given to it, so that it is more and more becoming a loam adapted to the growth of Beans and Flax. We saw 50 acres of Flax upon it, in July last, promising an abundant profitable yield. The process of claying was performed by cutting trenches 2 feet wide at intervals of 20 feet, and taking 1 or 2 feet of clay out, and spreading it on either side, according as the land appeared to need it. Some 200 cubic yards per acre were an ordinary dressing, and the labour cost from 30*s.* to 33*s.* per acre. Where the clay is near the surface it is better to make the cuts at shorter intervals, and take less out of each, as the levelling afterwards is more easily accomplished. Burning is given up in this fen; the peat wastes fast enough without it, and it is rather the object now to retain it than to lose it. The clay applied is a marl; it is a calcareous clay, and lime is not applied except experimentally, and then without results good enough to encourage its use. The means by which this farm has been made so fertile are drainage, application of clay, and expenditure in cattle food. The mineral and the animal matters needed for vegetable production are supplied by the two last; the first ensures both their preparation for use in the soil and the ready access to them of the roots of plants.

The Wheat crop of 1853 was abundant on this farm, when all the farms around it were complaining. The autumn of 1852 was so wet that the Podehole engines could barely keep the level of the water in the drains below the surface of the land, and the lowest portions of the fen were flooded. The seed time, generally, was one of the worst ever known since those Podehole engines had been used. But the six-horse engine and its little wheel on Mr. Aitken's farm just supplemented the deficient means furnished by the general drainage of the district, and the seed time of 1852 was good enough for him. Night and day, during that dreary time, was that little wheel contending for the mastery with the watery supplies, often 40 or 50 thousand tons a-day, which fell upon this 600 acre plot, and it was often a moot point which should gain the victory. The power employed, however, was successful ultimately; and while the neighbours' fields were soaked with water in the ditches following the plough sole in its furrow, these had never less than 18 inches drainage. It was a good seed time, therefore, here, though wretched everywhere around it, a good harvest time also, therefore, eight or nine months afterwards, when every other farm had reason to complain.

ECONOMY OF HARVEST WORK.

As almost all industrious and unremitting labour is grounded on self interest, this powerful principle should be brought to our aid in every operation on the farm, but particularly in harvesting the grain, in carting the harvest home and in harvesting roots.

Before I begin harvest I put a price per acre to every field according to my idea of the labour; and I put a paper with those prices into the hands of any company of four or more men who come for harvest work. The following are the prices for mowing, bagging, or reaping the several fields; those which are to be reaped, bagged, or mown are mentioned in the agreement which each company of men is requested to sign, and they also agree to work till all the fields are cut down; those fields which are mown have to be raked, and all of them are to be tied up in small sheaves, and set up in stooks of four sheaves two and two across, and the four sheaves to have a band around their head, so as to tie them together to prevent the wind blowing them down.

	Acres.		s.	d.			£	s.	d.

	144·79						62	9	7

There is no beer or cyder given to any of the workers. This averages 8*s.* 8*d.* per acre for cutting, binding, and stooking the crop of 144·79 acres.

I adopt the same principle in carting the harvest home to the rick-yard.

The carriage of grain from the fields to the rick-yard is performed in this way:—I bargain with one or two stout active men to find other two equally stout and active, and two stout active lads. Two of the men pitch the sheaves to the carts to the boys who build the corn in the carts, and the other two men pitch the sheaves from the carts in the rick-yard to the ricks. There are two ricks being built at the same time, so that there are two sets of carts, and I furnish as many carts and boys or women to drive them as keep the six men in full employment; and they bargain with me to do all this work at the rate of from 11*d.* to 1*s.* 2*d.* per acre over the whole, 11*d.* being the least sum paid, and 1*s.* 2*d.* per acre being the greatest. In 1849 I bargained with these men to do this work over the 144¾ acres for 8*l.*, or 1*s.* 1½*d.* per acre.

Two sets of carts, three in each set, and two ricks are being built at the same time; the ploughmen build the ricks, one man and a boy hand the sheaves to them on each rick, and a man to each rick is below keeping the rick in a proper form as it is being built. The man below, when the rick is above the eaves, gets on the next staddle on the other side of the cart, and part of the load is pitched to him while he begins to build the next rick, so that the pitcher may pitch one sheaf to the high rick and the next to the low one, and thus the rapid emptying of the carts is effected when the rick is high as well as when it is low. There are two boys driving the carts, so that there are two carts on the road, two carts being filled in the field, and two in the rick-yard being emptied; thus six one-horse carts are employed—two boys driving, the two boys on the ricks, and four men building. The ploughmen are yearly servants, and have 12*s.* per week, and the boys 5*s.* per week; but during the harvest the men have 1*s.* and the boys 6*d.* per day more, and as we frequently work during the night when there is anything ready to carry, I give the men I employ in building and the boys double the wages per hour during the night which they get during the day; and with this force of men and horses we have carried home 144 acres in 100 to 120 hours' work, which have been built in from 45 to 50 ricks, measuring about 120 cubic yards each, about 12 cart-loads of 200 sheaves each, so that each rick contained about 2400 sheaves. Each of these ricks produce from 80 to 200 bushels, averaging 120 bushels or 3 tons of Wheat and 5 tons of straw.

The staddles in the rick-yard are 14 feet in diameter and they are placed in two rows, with a cart road between them 20 feet wide, and the staddles are 20 feet from centre to centre in each row, so that the ricks are about 18 feet in diameter, and 15 feet high, measuring about 120 cubic yards each of unthrashed corn. As the ricks are being made I bargain with one or two men to thatch them with straw, for 1*s.* 6*d.* per rick, and 6*d.* per rick for shearing. The carting of the corn from the fields to the yard required 60 days of one horse, and 40 days of a boy

either on the rick or driving the cart. The money cost of the corn harvest will stand thus :—

	£	s.	d.
To cutting, tying, raking and stacking 144 acres of Wheat, Oats, and Beans	62	9	7
To pitching the corn to the carts and the ricks, and building the carts	8	0	0
To 4 days of a man building the ricks, say 3s. ...	6	0	0
To 4 days of a boy on the ricks or driving the cart, 1s.	2	0	0
To 4 days of a boy driving the cart, 1s.	2	0	0
To thatching 9 ricks, at 1s. 6d.	3	15	0
To shearing the sides of 44 ricks at 6d.	1	2	0
To 60 days of one horse and cart, say 3s. a day	9	0	0
Or 12s. 9½d. per acre over 144 acres	£94	6	7

Home Correspondence.

Steam Cultivation.—In common, doubtless, with many of your readers, I read with considerable interest the graphical account of "A day with the Steam Plough," by your correspondent "Cultor," which appeared in the *Agricultural Gazette* of May 12. True it is not, nor does it profess to be, a narrative of successful results, totally irrespective of the cost at which they have been attained, and which, however unimportant to the pocket of a noble projector, is a matter of life or death to the agricultural implement maker, or his usual employer, the tenant farmer. This affair of steam-ploughing may as yet be reckoned one of the unsuccessful cases in our agricultural practice ; but let us not be disheartened ; for though—thanks to Lord Willoughby d'Eresby and others—we know that the subject is beset with difficulties of no common order and magnitude, has not this been the case with mechanical inventions from the earliest periods of the world's history to the present day ! Take that of the steam-engine itself as an example. It is now nearly 200 years since the Marquis of Worcester promulgated his theories on the capability of turning this powerful but hitherto impracticable agent to account. Crude enough they undoubtedly were, yet they were the pioneers of all the wonders that have been since enacted by its means. Still it is not perfect. There are things it cannot or will not do, and steam-ploughing is as yet of them. The opinions of Mr. Hoskyns on cultivation *versus* ploughing—the two being different in his view of the case both in operation and result—are so well known as hardly to require more than a brief allusion to by me. All who have read—as who has not ?—his "History of Agriculture," and the still more recent and highly interesting "Chronicles of a Clay Farm," need but refer to page after page in each to obtain the fullest and most lucid exposition of his views as to the difference in the meaning of the terms ; nay, the very title of one of the vignettes in the "Chronicles" will amply suffice to indicate his peculiar and favourite maxim that cultivation can be carried on by other and better means than the plough. "Steam-power—no more to do with the plough than a horse has to do with a spade." Perhaps his objections to ploughs in general, and to steam-ploughs in particular, may by some be regarded as rather overstrained ; but certainly no one can deny the validity of those objections, especially on stiff clays—as he well and truly observes, "the mere invention of the subsoiler is a standing commentary on the mischief done by the plough." I suspect, after all, that our agricultural machinists have as yet shown on this subject, as on too many former occasions, but a small modicum of mechanical invention. The point in question is not how best to draw a plough through a stubborn clay, but whether on such a soil, or indeed any soil, a plough should be drawn at all ! Whether, in short, our author is not perfectly correct when he asserts that "a new power requires a new process." I well recollect the astonishment with which I heard (some 45 years ago) the observation of an ingenious old farming friend near Liverpool, who, after a discussion with me on the merits of various ploughs then in use, wound up by observing, in the coolest manner possible,—"After all, I very much doubt whether the plough is the best implement for breaking up the ground !" But Mr. Hoskyns has long since relieved my mind on that point, and I now never dip into his works without thinking of my old Liverpool friend and his theory of cultivation, a good half century in advance of his age ! So I make up my mind to this, that to set a steam-engine merely to pull a plough along is to begin at the wrong end ; and, not to mince matters, a downright misapplication of its power ; an operation wholly and entirely *infra dig.* The day will come, though I may not live to see it, when our cold clays will be better cultivated than by glazing and panning down the bottom of each furrow with ploughs, whether worked by horse or steam power, in order, as it seems to me, to give the subsoiler a job, viz., undoing what the plough had just been doing. Why all this doing and undoing ? Mr. Hoskyns has told us—and I for one am disposed to pin much agricultural faith on his sleeve—that the two-fold operation may be, and probably will be, at no very distant period, performed by one implement ; of course when steam shall have had fair-play, and our Ransomes, and Garretts, and Crosskills shall have done as much for steam cultivation as they have done for steam-thrashing and and steam-chaffcutting, to say nothing of what may be achieved by their machinery in the harvest field—a work which, though far from complete, has of late made considerable way towards a satisfactory development. Looking at our first crude attempts at railways, who could have anticipated that the cumbrous locomotives formerly to be seen near Leeds, "working by a cogged wheel and rack, at a very slow rate," we are told, should have been the precursors of those mighty leviathans of the Great Western, now daily and nightly traversing between London and Exeter—a space of nearly 200 miles—in little more than five hours ? *S. Taylor, Gloucester.*—I think we shall before long have the steam up, and be able to shout "Off she goes !" But the engine, it seems, will not go upon our clumsy roads ; by common consent it is not such a good walker in the rough field as a horse or ox—for the horse has the discretion to step over a hole. But if the engine is conveyed to the field, there seems a probability that it will do some heavy work when once there, if it gets the proper implement to do it with. But a word more about the implement that is to do the cultivation—what is it to be ? Authorities seem sadly divided about it. They cannot (some of them) think of putting such a noble power as steam before such an antiquated implement as the plough ; but will they ever find anything that will do such hard work, and go through such an ordeal uninjured ? When I take hold of a plough in some extra hard clay corner or headland, for a short time, and see it turning up dry, hardened material, almost like rock, I cannot help thinking that to scratch up such soil (if soil you can call it) would defy the most powerful engine that we can have brought into the field. I have no intention as yet of dropping the motto "speed the plough." We have a machine that will work well in all soils, and all sorts of weather ; and if we feed the land well, we shall have as good crops after it as can stand upright. What we want is a power strong enough to draw this at a cheaper rate than horses or cattle. For we must have horses to do carting work, which is no small part of our labour ; and ploughing perhaps is mostly done when we have not much else to set horses about. However, if it recommend itself in point of economy, it will soon be patronised. It is with pleasure I notice the plan proposed by Mr. Williams, given in your report of the London Farmers' Club on the 19th of May. If he is to use four or six ploughs, they of course must go one before the other, and of necessity there will be some considerable distance from the first to the last. This had better be lessened as far as possible, and that I think might be done by making each plough upon the principle of the most improved skim coulters, so that immediately behind the share the turn-furrow shall turn off, and nothing be in the way of the succeeding furrow being thrown into the bosom of the preceding turn-furrow, and so I think the furrows would clear up behind each other in less distance than a foot; even then the length of the whole working parts of the machine would be over 8 feet. All the fixings can be above the level of the furrow ; and I do not see what use handles can be to such a thing. A steerage, such as that on Hornsby's drill, seems to me best adapted for the purpose. And there must be some more ingenious method of fixing anchors at the ends of the field than that of digging great holes. *S.*

The Pheasant.—When these birds are taken young into keeping they become as familiar as chickens, and when they are designed for breeding they are put into a yard, five hens to a cock. In her natural state the female makes her nest of dry Grass and leaves ; the same must be laid in the pheasantry, and she herself will properly dispose them. But I keep bantam hens to supply her place, which task she will perform with great perseverance and success; by this means I get two broods in one year. The young ones are very difficult to be reared, and they must be supplied with ants' eggs—which is the food the old one leads them to gather when wild in the woods—eggs boiled hard chopped small, with curds or other meats ; and the young ones are to be fed with great exactness, both as to the quantity and the time of their supply. This food is sometimes also to be varied, and woodlice, earwigs, and other insects are to be made a variety. The place where they are reared must be kept extremely clean ; their water must be changed twice or thrice a day ; they must not be exposed till the dew is off the ground in the morning, and they should always be taken in before sunset. When they become adult, feed them on Buckwheat, Barley, with occasionally Jerusalem Artichokes, of which they are very fond, Cabbages, Lettuces, and other vegetables. The pheasant is a very bold bird when first brought into the yard among other poultry, not sparing the peacock, or even such young cocks and hens as it can master, but after a time it will live tamely among them, and at last be brought to couple with a common hen. The breed thus produced take much stronger after the pheasant than the hen ; and in a few successions, if they be left to breed with a cock pheasant—for the mixture is not barren—there will be produced a species more tame, stronger, and more prolific; so that it is strange why most of our pheasantries are not stocked with birds produced in this manner. *A Young Sportsman.*

Crops in Yorkshire.—I have recently inspected a great quantity of land in Yorkshire and the adjoining counties, and beg to forward you a few notes on the present appearance of the forthcoming crops. Autumn-sown Wheat, on land in fair cultivation, though rather backward in growth, looks well. Spring-sown Wheat generally looks puny, and is a bad colour. A good deal of Wheat, sown upon Clover lea, has utterly failed, and the land has had to be ploughed up and sown with Oats or Barley. It is at present impossible to speak positively as to the result of this most important crop, but two negative points may, I think, be safely foretold—there cannot be a great crop like that of last year, neither can there be an early harvest. Oats and Beans have come up well, and in general look tolerably healthy. Barley on much land has come up patchy. Pastures are generally without Grass, and thus far the prospect of the hay crop is a very bad one. *Roaldus.*

Societies.

ROYAL AGRICULTURAL OF ENGLAND.

SPECIAL COUNCIL, *May* 30 : Mr. MILES, M.P., President, in the Chair.

DEPUTATION TO PARIS.—The following letter from the Consul-General of France having been laid before the Monthly Council on the 2d of May, when preliminary arrangements were made in reference to the formation of a Deputation to the Agricultural Meeting to be held at Paris in the first week of June, was again submitted to the members at this meeting, specially summoned for making the final appointments :—

"Londres, le 28 Avril, 1855.

"Monsieur — J'ai l'honneur de vous informer que M. le Ministre de l'Agriculture, du Commerce et des Travaux Publics vient de me faire savoir qu'il verrait avec la plus vive satisfaction que la Société Royale d' Agriculture d' Angleterre envoyât en France des délégués pour la représenter au Concours Général Agricole qui doit avoir lieu à Paris. Son Excellence me charge d'assurer la Société Royale de toute la sympathie qu'une pareille démarche de sa part inspirerait au Gouvernement de l'Empereur.

"Je vous prie donc, Monsieur, de vouloir bien faire part au prochain Conseil de la communication que j'ai l'honneur de vous adresser. Je suis d'autant plus heureux d'être ici l'interprête du Gouvernement de S. M. I., que connaissant les dispositions favorables de la Royal Agricultural Society of England, je ne doute pas de l'accueil empressé que recevra de ses membres l'invitation de son Excellence M. Rouher.

"Veuillez agréer, Monsieur, les nouvelles assurances de ma considération la plus distinguée,

"Votre très obéissant serviteur,

"Le Consul Général de France,

"ED. HERBET.

"James Hudson, Esq.,
"Secretary to the Royal Agricultural Society of England,
&c. &c. &c."

The following Deputation was then appointed—Mr. Miles, M.P. (President), Mr. Garrett, Mr. Brandreth Gibbs, Mr. Fisher Hobbs, Mr. Hudson (Castleacre), Mr. Hudson (Secretary), Mr. Jonas, Mr. Milward, Professor Simonds, and Professor Way.

The Counsul-General also communicated to the Council the request of the Minister of Agriculture and Commerce, that they would kindly undertake to name two jurors to act on the part of this country, at the Paris Agricultural Show, in the classes of Short-horned and other cattle, and in those of Pigs and Sheep. The Council decided accordingly that Mr. Milward, of Thurgarton Priory, should be requested to act in the former, and Mr. Fisher Hobbs in the latter, of those classes.

WEEKLY COUNCIL, *May* 30,—Mr. MILES, M.P., President in the chair.

DAIRY MANAGEMENT.—Mr. Horsfall, of Burley Hall, favoured the Council with the following additional communications, which (with the former ones) were referred to the Journal Committee :—

"Burley Hall, May 23, 1855.

"As I observe from the papers that the subject of dairy produce is again to be discussed at your next council meeting, I beg to introduce the following observations confirmatory of my former statement. From December, 1854, when the peculiar richness of my cream was first noticed up to the date of this, my dairy proceedings have been closely watched by myself, and more particularly by one of my family, whose care and exactness may be relied on; the result throughout has been a yield of 25 oz. of butter from each quart of cream, with but slight variations. During the same time frequent experiments have been made on the proportion of butter from milk : these have shown a yield, also with little variation, of 2 quarts from 32 of milk, or 3 from 48, and in like proportion. When the churning took place of the butter, from which the sample was sent to Prof. Way for analysis, I personally superintended the process of 15 quarts churned at three times in equal quantities ; the first five gave 127 oz. of butter. I measured the butter milk, and found it to be barely 3 pints ; the proportion will be per cent. :—

Butter	70
Butter milk	30
	100

The remaining two churnings varied but little, as will be seen from my former statement. Up to the close of April the diet of my cows underwent little change, Mangold being substituted for Kohl Rabi. I then added the following ingredients to my steamed mixture :—1½ lb. of Rape seed per day for each cow, ground with an equal quantity of Barley, together 3 lbs.; after this, a like quantity of Linseed treated in the same manner. These experiments were continued nearly three weeks. I did not find any increase in the quantity of cream, nor in its richness in butter. My cows have now been more than a week on depasture, during daytime; they are supplied with two full feeds of the steamed mixture evening and morning, whilst in stall; my most recent churning gave fully 24 oz. from each quart of cream. The weight of the butter is ascertained after it has been made up, and in the state in which it is disposed of. My observations on dairy treatment tend to the conclusion that if you afford a cow an ample supply in her food of each element, both mineral and organic, suited to her requirements, constitution, and produce, she will use them to the greatest advantage, and with the most complete result ; that if you go beyond this by an excessive supply of material suited for butter or for curd, the result will not show a greater proportion of these substances. Having now explained my *modus operandi*, and the results at which I have arrived, I beg leave to state to your honourable Council, that if it should appear that I have omitted anything calculated to arrive at a sound and correct conclusion, I should be most willing to receive and attend to instructions which may be deemed serviceable ; of if it should appear that inquiry on the spot would better serve the purpose, I beg to express my willingness to afford any one your honourable Council might depute the freest and fullest information I am possessed of. I am quite aware of the caution and mistrust with which remarkable or extraordinary statements are viewed by the agricultural mind. As some proof of this, I may instance the recent remarks of an ably conducted weekly publication, whose editor has certainly no interest in trying to impugn or weaken the statements of one whose communications he has frequently admitted in the pages of his journal.

May 28, 1855.

The following detailed relation of my mode of testing the results of my produce, and of other regulations of my dairy, will, I am led to think, not be deemed uninteresting. The observations are on my most recent churning, early this morning,

Monday, May 28th, and are on the milk skimmed during one half of the week. I make butter twice a week.

	Skimmed milk	Cream.
1st meal	36 quarts ...	2¼
2d "	32 " ...	2
3d "	36 " ...	2¼
4th "	36 " ...	2¼
5th "	36 " ...	2¼
6th "	50 " ...	3½
7th "	48 " ...	3
Total skimmed ...	274 Cream ...	17½
	Cream for families ...	1¼
	Total cream from 274 quarts ...	18¾

A considerable portion of my milk is sold when new. The sale of this varies in quantity, and leaves less or more each day for butter. My average yield per day is 145 quarts from 15 cows, from which I obtained in April 160 quarts per day. Before the cream was churned I tried to ascertain its quantity by observing to what height it reached in the cream jar, and then filling this with water to the same height, when 18 quarts were required, the jar being more than 12 inches wide at the top, a slight deviation in ascertaining the height of the cream would account for the difference of the ½ quart, 17½ quarts being shown by the separate measurement. The consistency of the cream after having stood till churning is such that a piece of wood 2 feet 3 inches long, 1 inch by ½ inch, on being dipped to half its length in the cream, retains, according as its is immersed, its upright or oblique posture; to measure it out by separate quarts is therefore troublesome. The churning commenced at an early hour this morning, before 4 o'clock. Temperature of dairy 49°, of cream 52°. The cream was churned in quantities of about 6 quarts at three times. The first churning cream alone occuped 30 minutes; with the second and third 1 quart of fresh water was added to each. The time occupied was 45 minutes for each churning. The whole of the butter was of firm good quality, that with the addition of fresh water having the preference. The result of these three was 17 rolls 6 ozs., 25 ozs. to the roll, of well made butter. On deducting the 2 quarts of water, there appeared full 5 quarts of butter-milk, without taking into account that portion washed out in making up the butter. These remarks confirm what I have previously stated; indeed, under like conditions of temperature, &c., there have been but slight variations during the six months in which these tests have been applied. Taking the cream as measured separately, 17½ quarts yielding 17 rolls 6 ozs. of butter, show one roll of 25 ozs. per quart of cream, minus 6½ ozs. on the whole. As computed on the aggregate, 18 quarts yield 17 rolls 6 ozs., show 24 ozs. of butter per quart of cream, minus 1 oz. on the whole. The comparison of butter to milk will be—

	Quarts.		Rolls	oz.
Skimmed milk... ...	274			
Cream churned... ...	17½	Produce of butter ...	17	6
Cream used	1¼	From cream used ...	1	6
	292¾		18	12

Gives from 16 quarts 25½ oz. of butter on the morning of the 26th inst. The whole of my milk which had stood 36 hours became sour; the temperature on the previous day ranged at 60°. Early on the 26th I, in consequence, adapted my dairy to summer temperature, by supplying a shallow cistern of 3 inches deep, in which my milk bowls stand with cold instead of warm water, which latter I use during cold weather. The water enters the cistern at one end, and, after travelling through the bowls, and filling the cistern to the depth of nearly 3 inches, escapes through a hollow perforated tube at the other end of the cistern; the taps are then adjusted so as to allow a constant trickling through the clay; besides this, a blind or curtain of strong calico or cotton fabric is hung before the trellis window, on to which cold water is spirted several times during the day, through a rose attached to a small gutta percha tube, so as to keep the curtain wet throughout the day. A thermometer with the bulb immersed in the water denoted a temperature of 51°; one out of the water even with the top rim of the milk bowls, 55° 30'; one on a shelf of wood, 2 feet above the bowls, a temperature of 60°. A thermometer placed on the utside wall to the north, and in the shade, denoted a temperature during a great part of the day of 72°. I need scarcely add that the result of the summer adaptation is most satisfactory; indeed, the experience of former seasons leaves me no room to expect any recurrence of sour milk during this summer season. Having satisfied myself that with a temperature much under 50° I lose perceptibly in gain of cream and butter, and also with a temperature of 60° I suffer from my milk turning sour, I cannot but remark on the lack of attention evinced in this country to the proper regulation of temperature in dairies, not only in small but, as far as I am aware, also in large ones. In the several treatises on dairy husbandry in the Journal of your Society, I do not recollect having observed any allusion to the policy of regulating the temperature of dairies. During the present season, certainly an uncommon one, I found it advisable to continue the warming process almost without interruption till the first week in May, when the thermometer ranged low—frequently during the night at some degrees below freezing point. Within less than a month I am necessitated to resort to means of subduing the temperature by the process I have described.

"Thomas Horsfall."

Agricultural Improvement of Ireland.—At the late meeting of this Society the half-yearly report was read, from which we make the following extracts. Sixty new members have been added to the Society since the last half-yearly meeting in December.

Twenty-eight local farming societies are in connection with the central body, and others on the eve of revival, which promise to form an important auxiliary to those already in operation.

At the Carlow meeting of the Society, to be held on the 8th, 9th, and 10th of August next, the Council anticipate a large and important agricultural exhibition. The implement class in the premium sheet have received their most careful consideration; money prizes to a large amount have been substituted for medals in order to meet the wishes of exhibitors.

Chemical Analysis.—This department forms one of the most useful and important objects of the Society, and the Council have to report the increased desire of members to avail themselves of the services of Dr. Apjohn, particularly in the analysis of guano and other manures, so necessary as a prevention against adulteration.

The remainder of the report related to the office of secretary, and was followed by a long discussion, in which the discharge of the duties of that office, and the arrangement for the future of weekly and monthly meetings of the Council were considered. It resulted in the adoption of the same rule as that which directs the meetings of the English Agricultural Society.

Notices of Books.

Instructions for growing Italian Rye-Grass. By William Dickinson. J. Ridgway, Piccadilly.

This pamphlet is from the pen of one of the most successful growers of the plant. Mr. Dickinson has introduced good sorts of seed, and grown enormous crops; and now he gives his experience this public form for the benefit of English agriculturists. We shall not quote the extraordinary statements of profit derived from its cultivation given at the end of his book, but confine ourselves to an extract in which he describes the treatment of the land and of the crop previous to its maturity:—

"I advise the preparation of the land to be made for an August or September sowing (the earlier month to be preferred), which is well understood by the general terms of plough, clean, dress, and pulverize; Grass seeds cannot vegetate upon clods, sow two bushels of seed per acre each way of your land, two this and two that way across, from the broadcast machine, the long trough and barrow, bush harrow lightly, and wait for a crop. If weeds grow, hand weed the first crop, and you will not be troubled again during the two years the plant stands. If your plant is vigorous, it wants nothing till you have a cutting; if it be weak, mix two cwt. of guano to the acre with some earth or damp ashes, and give it a dressing while it is young. It is important to have a large crop the first cutting; almost all your success depends upon it. It is better to give two dressings if your land is poor, than to have a light crop the first time. If you cut a small piece of land for your daily supply of Grass, you have but a small piece of land to water, your liquid will suffice; but if you have to cut a large piece of land, you will have that large piece to water, and your liquid may be insufficient. Be assured of this, that the plant will repay you for any extravagant dressing you may give it. You may grow 5 tons to the acre, or 15, or you may grow 25 in one crop. I once grew a much larger crop, but it could not stand; it was 5 feet 10 inches high, and was borne down by its own weight. Urine is the very essence of all manures, but it wants using with great judgment. The specific gravity of it differs in different animals. Water being 1000: that from pigs is the lightest I have tested, it is about 1006; that from sheep next; from cattle, 1015; that from horses and human beings is the heaviest, about 1020 to 1025, according to the quantity of salts they contain, all being influenced by the food taken. Urine being collected from various animals without water will weigh about 1018; one part of this to two of water will reduce it to 1006, which is, I think, the most economical method of using it to the plant. It may be given stronger, if it can be afforded, but should not be given weaker. An acre will require for one watering about 3500 gallons. One watering produces one crop upon tenacious lands; very open light soils might require two, if so, it would well repay the cost. I must not mislead those who have not used the liquid. Urine and water, of the specific gravity of 1006, would be too strong for common Grasses, and would entirely destroy Clover. Common Grasses should have one of urine, four of water; Clover, one urine, six water. I do not think it a first-rate dressing for Clover. I must also observe that dung water from yards open to rain should only be used as water to reduce the urine, to be tested with the urine meter. Where pipes under ground and the steam engine are used I have known a plunge pump inserted to stir up effectually all the deposit in the tank of putrid flesh and animal dung, to be forced through the pipes and cover the plant with it. This I think a mistake. The food is rendered filthy for the animals to eat; they walk over it again and again when turned out to graze, eating as little as possible, and tread it to waste. It is unfit for the plant to digest; although it will be filtered in some degree passing through the earth, according to the tenacity of the soil, it will not be rendered sufficiently clear for the immediate reception of the plant. If the plant cannot take up the liquid immeately it is applied, a great portion of it is wasted. The object of liquid is an immediate effect upon the crop of Grass, to be grown in three or four or six weeks. I should not use liquid manure for any crop that was to be six months in the land; I should use the substance which would not be dissipated before the plant be perfected. I think they have two different merits; the liquid for the present, the solid for the future. They should no more be huddled up together than our sovereigns and shillings should be in our pockets."

No plant probably is so gross a feeder as the Italian Rye-grass, and by none can so large a quantity of powerful manure be economically assimilated. The above quotation describes a plan of management of which our readers can avail themselves for the cultivation of the crop after Tares, Winter Beans, or even after the grain harvest of this season.

The following extract, from Mr. Martin Doyle's little book on "Small Farms" (Routledge & Co.), on haymaking, will soon be appropriate to the season:—

"*Clover and Haymaking.*—If you have a due proportion of Clover from the sowing of the preceding year, you will have to convert the principal part of it into hay about the middle of June. I shall suppose that some of it has been previously mown for soiling: mow the main crop before the blossoms are ripe, particularly if any Rye-grass is mixed with it, else the stems of this will be hard and wiry, and deprived of their nutritious qualities. If you can seize upon a favourable time, with the wind N. or N.E., the probability is that you will cut and carry the crop without its receiving a drop of rain. Never wait beyond a week of propitious weather, even if the Clover be a little under-ripe, on the chance of the continuance of such season. By cutting early, too, the second growth will be accelerated and more abundant, and the land less exhausted than if the flowers had been allowed to ripen. Instead of saving seed from the second, and therefore twice-mown, crop—a frequent practice—feed off a portion of the first until the end of May, and reserve the second growth of that part for your seed. By letting the first crop mature their blossoms, the second crop may be too late for ripening favourably; besides, the plants will be more vigorous from not having suffered the exhaustion of a second maturity.

"Clover will not bear tedding like common Grasses; the leaves crumble, or become discoloured, if exposed to too much weather. The best mode of saving it is to turn it over with a hay-fork, until, by the evaporation of superfluous succulence, it has shrunk at least 2 inches in thickness.

"From the small cocks in which it should be saved, it may be ricked on the fourth* day in real summer weather, but in our uncertain climate, rain will often interrupt the process; nothing then can be done; wait with due patience for a dry day. The self-fermentation of the Clover, by which it retains its nutritious juices, and only loses its watery particles, is the true principle by which the process of converting Clover into hay should be conducted. The Rev. Mr. Klapmeyer, of Courland, has made both his theory and practice known in England through Mr. Taylor, who some years ago, in a very lucid manner, conveyed the communication to the Editor of the *Irish Farmer's Journal*. By his process the sap-vessels are expanded by the circulation of the juices through the agency of heat, and the excess of humidity is dissipated; on cooling, the sap-vessels contract, and thus future internal fermentation is prevented, and the nutritive elements are preserved. Mr. Klapmeyer allowed his Clover to remain in the swathe until 4 o'clock P.M. of the day following the morning of cutting; it was then raked into little cocks, and afterwards put together for fermentation into very large ones, trampled down by one or two men's feet to accelerate fermentation, which, if the night be warm, will commence in a few hours. After a sufficient fermentation arose,—proved by the usual appearances of smoke in opening out the Clover, and some change of colour, it was spread out, and in the afternoon (of the third day) carried into the barn without danger of a second fermentation. This is an excellent mode of producing the fermentation by which the saccharine qualities are developed; 'it resembles,' observes Mr. Taylor, 'in some degree, the process of making malt from Barley, and requires similar attention.'

"Heavy rains fall in Belgium, as in England; therefore the intelligent gentleman who has made known the details of the process in favourable weather gives ample directions for saving Clover in unfavourable seasons, when partial fermentations will occur amidst delays and interruptions. His principle seems to be, that intestine fermentation should be induced, though it may be by slow degrees; he recommends, therefore, the separation of the unfermented portions from those which have heated, for the purpose of undergoing the process at some time of the course. The closing remark of minute and lengthened details is important:—'The fermented Clover remains good, even if it continues some weeks exposed to the rain, provided it is at last suffered to dry before it is put into the barn, otherwise the wet from the rain will render it musty and bad. The Clover which has been for so long a time exposed to the rain will not, however, be so nutritious as that which has been well fermented and sooner dried, but it will be superior to that which has been exposed to the rain and got up in the common method.'

"As you may have some part of your lawn, or a field not included in the regular farm department, under meadow, I shall briefly notice the ordinary haymaking process, though not a part of the Norfolk system, in order to dismiss the subject of which Clover haymaking is a branch. For your carriage-horses, hunters, and roadsters for fast work, if you have any of these, for which Clover-hay would be too foggy, hay of a less succulent quality will be necessary.

"In England, the art of haymaking is admirably understood, though from the rapidity with which it is sometimes ricked, to obtain early fermentation, much hay is often destroyed by spontaneous combustion, and never more frequently than in very bright weather, when the sun produces in it a deceptive appearance of its having sufficiently parted with its moisture; the consequence is that it heats excessively, emits smoke, takes fire, and is consumed, or, if saved from combustion, is so fire-fanged as to be deprived of all its alimentary properties.

"Meadow Grass is tedded out and separated as much as possible, a few hours after the mower has cut it down, and turned at intervals to expose it equally and thoroughly to the influences of the sun and air. If the weather be fine, that which was cut before breakfast hour may be gathered into windows, and put into little cocks on the same day. On the ensuing day these cocks should be opened out when the dew has evaporated, and the already half-made hay repeatedly turned during the day; in the evening the rows may be doubled, and made into much larger cocks than on the preceding day. On the fourth day, what was first mown may be carried for the rick; and by having a tarpaulin with a suitable framework and ropes, the succeeding quantities of hay, according as they are saved, can be ricked; or, if rain falls, left out for a favourable time, while the portion under the tarpaulin is safe.

"When a few acres only are in question, these should

* Irrigated meadows, and all heavy crops on low lands, may require a great deal more time.

be cut down, as in the preceding instance, as rapidly as possible, one good mower cutting an acre as his day's work; and the cost of a tarpaulin may be dispensed with, though it is very useful in any case, to protect the hay from dew or rain during the formation of the rick; and where one is available the field cocks can be brought to the rick as fast as they are saved. Unless for horses which may require to be limited in their allowance of water, it is desirable to sift salt very evenly through each course of hay, at the rate of 14 lbs. to the ton, and some people add coarse sugar to it, which gives it a flavour of which horses are very fond.

"If there be any reason to apprehend danger from atmospheric moisture in hay, layers of straw may be introduced with good effect. A neat farmer will thatch his rick immediately after it is finished."

Miscellaneous.

Rain during January, February, March, and April, 1855.—

Locality.	January and February.	March.	April.	Total each locality.	Average fall during four months.

Calendar of Operations.

MAY AND JUNE.

WEST SUSSEX, *May* 29.—Saturday the 26th will be memorable as the first warm day of the season. The atmosphere was completely changed. For the previous three weeks we had frequent showers, but though it kept the corn green, yet the Grass made but little progress. And we may now put down the Clover crop as a complete failure, come what will, as it is now coming in flower, and hardly long enough to mow even where it does cover the ground, which it does in few places, and it is no uncommon thing to see the mowers in the field cut, not the Clover, but the Groundsel and other weeds that have established themselves where it should have been. As may be expected, feed has been very scarce, and we have heard of high prices being given for it. And as a consequence little hay will be made, and it will be dear next year, as there is little of the old stock left. The Wheat is said to look but indifferently in some places, but in this part of the country, where the land is good, it is doing well. We shall have no Wheat ears in May, but though late it is all right in other respects. Barley and Oats look well, and the young Clovers in them have struck root better than usual. Mangold Wurzel was generally got in, with the land in the best order—too dry for their growth, but the rain came just as sowing was finished, and has brought them all up together, and for their cultivation in clay land nothing could have been better than the season. This week will be the commencement of Swede sowing; the land has been ready for some time, and (a thing that rarely happens) we have waited till we thought the proper time has come, although we have doubts if it is not too early. Among early Turnips that have been sown for eating up before Wheat sowing, we have found the fly very busy. But it is seldom that it comes to do much harm where superphosphate of lime has been used. Where it has been used I have never but once had to sow a field twice, and that was where we used home made superphosphate; and I believe the bones were not dissolved enough so as to be quickly available for the plants, to push them up. And another cause that combined perhaps with this circumstance was sowing too early—the 24th of May—when the land was not sufficiently warm. We often hear, and indeed see, that early sowing is not so safe; and that I believe is not that the fly is less ready in the middle of June to destroy, but that the crop by the heat of the soil is driven up more quickly, and so defies it. Our country markets are not over supplied with fat stock, and it goes off rapidly at high prices over 5*s.* per stone for beef and mutton, and nearly 6*s.* for lamb. Lean stock are not cheap, but there is but little sale for them, as keep is so short; but they will no doubt soon be wanted. *G. S.*

Notices to Correspondents.

ANALYSIS OF TWO SAMPLES OF SUPERPHOSPHATE: *Agricola*—

	No. 1.	No. 2.
Moisture	10.00	21.76
Organic matter and salts of ammonia ...	12.01	7.16
Sand, &c.	6.45	20.75
Biphosphate of lime	7.67	10.41
equal to		
Soluble phosphate	11.31	15.36
Insoluble phosphate	26.67	8.60
Hydrated sulphate of lime	37.20	31.32
	100.00	100.00

	No. 1.	No. 2.
Nitrogen	1.02	0.30
equal to Ammonia	1.18	0.35

Value the ammonia at 8*d.* per lb., the soluble phosphate at 2*d.*, and the insoluble phosphate at ¾*d.*, and No. 1 comes out worth about 4*l.* 15*s.*; and No. 2, 3*l.* 12*s.* per ton.

LUPINE SALT: *Clathrus celatus.* Is it of any use to the Swede crop? Will any one state his *experience?* It is especially useful for Mangold Wurzel, but not that we are aware for Turnips.

ECONOMICAL MANURE: *C.* We believe the two are the same.

LIQUID MANURE: *W W L.* If very much diluted you may use it in a liquid manure drill, which deposits the liquid on the top of the drill immediately before the seed. But for use by your implement we would apply it undiluted along with whatever artificial manure you propose in the furrows before splitting the drills previous to hoeing.

A SICK COLT: *J W S.* Your letter has not yet been replied to by our veterinary referee; but we presume that treatment similar to that of a calf will be proper. Only give it milk oftener, say every two or three hours, as much as it will take.

CAUTION.

PARKES' STEEL DIGGING FORKS AND DRAINING TOOLS.

Whereas very inferior descriptions of Steel Digging Forks are now manufactured and sold, and I have been informed that purchasers of the same have believed them to be the same as those manufactured by me, and to which the Royal Agricultural Society and numerous Agricultural Societies' prizes have been awarded, I hereby respectfully inform the public that every Fork manufactured by me is stamped with my trade mark "J. P.," and that Messrs. BURGESS & KEY, of No. 103, Newgate Street, London, are my sole Wholesale Agents, and I have authorised them to replace to the purchaser every Fork of my manufacture found defective; they will also on application send Wholesale and Retail Price Lists, &c., post free. FRANCIS PARKES & Co.

DO YOU BRUISE YOUR OATS YET?—One bushel of Oats when Crushed will make two. Great saving. OAT BRUISERS, Chaff-cutters, Ploughs, Threshing Machines, Flour Mill Carts, Corn Dressing do., Horse and Steam Machinery put up, &c. Book on Feeding, 1*s.*

M. WEDLAKE, 118, Fenchurch Street, London.

WEDLAKE'S NEW HAY-MAKER, only 10*l.* 10*s.* 6*d.*, cash in advance. Wedlake's New Horse Hay Rake, cash in advance, 3*l.* 15*s.* 6*d.* Book on Making Hay Cheap, 1*s.* Book on Feeding Horses Cheap, 1*s.* List of 260 Cuts of Machines, 1*s.*—118, Fenchurch Street, City.

IMPROVED LAWN MOWING MACHINES,

MANUFACTURED AND SOLD BY J. AND H. FERRABEE, Phœnix Iron Works, near Stroud, Gloucestershire.

Budding's Patent.

These are the only MOWING MACHINES that can be used by unskilled labourers with equal facility on Lawns, Verges, between Flower beds, on Bowling Greens, Cricket and Pleasure Grounds; 4500 of them have been sold.

London Agency:—The Manager of the Agricultural Department, Baker Street Bazaar.

RICHMOND & CHANDLER'S PATENT CHAFF-CUTTING MACHINE.

All the various modern Implements of Agriculture manufactured on the most scientific and improved principles, suitable for home use and exportation.—Address, RICHMOND & CHANDLER, Salford, Manchester; and 32, South John Street, Liverpool.

☞ CATALOGUES GRATIS.

PARKES' STEEL DIGGING FORKS & DRAINING TOOLS.

MESSRS. BURGESS AND KEY, as Mr. PARKES' Wholesale Agents for England, have always in stock a large assortment. These Forks and Tools are now in use by upwards of 1000 of the Nobility and Farmers, members of the Royal Agricultural Society, who pronounce them to be the best ever invented, and to facilitate labour at least 20 per cent. Price Lists sent free on application, and Illustrated Catalogue of the best Farm Implements, on receipt of eight postage stamps.

TRELOAR'S COCOA-NUT FIBRE MANUFACTURES, consisting of MATTING, MATS, MATTRESSES, BRUSHES, NETTING, HORSE-HAIR, and BRISTLE SUBSTITUTE, are distinguished for superiority and excellency of workmanship, combined with moderate prices. Prize Medal both in England and America at the Exhibition of all Nations.

T. TRELOAR, Cocoa-nut Fibre Manufacturer, 42, Ludgate Hill, London.

FOUNTAIN BASINS, VASES, STATUES, FLOWER TRAYS, &c. in TERRA COTTA.

By J. M. BLASHFIELD, Praed Street, Paddington, London.

BEEHIVES.

MILTON'S IMPROVED COTTAGE HIVE, price 1*l.* 2*s.* The only Beehives for which the Exhibition Prize Medal of 1851 was awarded, with all the latest improvements to obtain pure honey without killing the bees: also every kind of Patent and Wooden Hives, Glasses, Feeders, &c.

"The Practical Bee Keeper," the most useful book of the day, a complete Guide to Bee-management, by JOHN MILTON; price 2*s.* Likewise his Illustrated Catalogue, price 8*d.*; per post, 4*d.*

Beehive Warehouse, 10, Great Marylebone Street, London.

BEE HIVES.

NEIGHBOUR'S IMPROVED COTTAGE BEE-HIVE, as originally introduced by GEORGE NEIGHBOUR & SONS, with all the recent improvements, glasses, thermometer, &c., price 35*s.*, securely packed for the country.

This unique hive has met with universal commendation, and may be worked with safety, humanity, and profit, by the most timid; its arrangements are so perfect, that the honey may be taken at any time of the gathering season without at all injuring the bees.

Early applications, addressed to GEO. NEIGHBOUR & SONS, 127, High Holborn, or 149, Regent Street, London, will receive prompt attention. Their newly arranged Catalogue of other improved Beehives, with Drawings and Prices, sent on receipt of two stamps.

Agents:—Manchester, HALL & WILSON, 50, King Street; Liverpool, JAMES CUTHBERT, 12, Clayton Square; Chester, F. & A. DICKSON & SONS, 106, Eastgate Street; Glasgow, AUSTEN & M'ASLAN, 186, Trongate Street; Dublin, J. EDMUNDSON & Co., 61, Dame Street.

IMPORTANT TO GROWERS OF ROSES.

NEWLY-INVENTED APHIS BRUSH, OR GREEN FLY DESTROYER.—The attention of Florists is particularly called to this Cheap and Ingenious Instrument, invented by the Rev. E. S. BULL, of Colchester, which, in a very simple and easy manner, instantly cleanses the Rose from that destructive insect the Green-fly (or Aphis), without causing the slightest injury to the bud or foliage.

Price 2*s.* 6*d.* each, or free by post, 3*s.* 6*d.*

MANUFACTURED BY

JOSLIN AND SONS,

IRONMONGERS, Colchester.

Retailed by all the principal Ironmongers.

Wholesale Agents:

W. THOMPSON & SON, 15, Upper North Place, Gray's Inn Road, London.

RIPE FRUIT, STRAWBERRIES, AND SEED BEDS.

NEW TWINE NETTING (Tanned if required), 1 yard wide, 2*d.* per yard; 2 yards wide, 6*d.* per yard; 4 yards wide, 8*d.* per yard. Half-inch MESH do., 2 yards wide, 8*d.* per yd. The ELASTIC HEXAGON GARDEN NETTING, 76 Meshes to the square inch, effectually excludes birds, wasps, flies, &c., from fruit trees, flower, or seed beds, 4½*d.* per square yard. TANNED NETTING, 2 or 3 yards wide, 1½*d.* per yard; 4 or 6 yards wide, 3*d.* per yard, at W. CULLINGFORD'S, 1, Edmund Terrace, Ball's Pond, London.

Samples exhibited, with prices attached, in the South-west Gallery of the Crystal Palace, Sydenham.

DEANE, DRAY, AND CO. are sole Agents for LINGHAM'S PERMANENT LABELS, samples of which, with their Illustrated List of Horticultural Tools, can be sent, post paid, to any part of the United Kingdom. Also, Wholesale and Retail Agents for SAYNOR'S celebrated PRUNING KNIVES, used exclusively by the first Gardeners in the United Kingdom.

DEANE, DRAY, & CO. (Opening to the Monument), London Bridge.

WATERPROOF PATHS.
BARN AND CATTLE SHED FLOORS.

THOSE who would enjoy their Gardens during the winter months should construct their walks of PORTLAND CEMENT CONCRETE, which are formed thus:—Screen the gravel of which the path is at present made from the loam which is mixed with it, and to every part of clean gravel add one of sharp river sand. To five parts of such equal mixture add one of Portland Cement, and incorporate the whole well in the dry state before applying the water. It may then be laid on 2 inches thick. Any labourer can mix and spread it. No tool is required beyond the spade, and in 48 hours it becomes as hard as a rock. Vegetation cannot grow through or upon it, and it resists the action of the severest frost. It is necessary, as water does not soak through it, to give a fall from the middle of the path towards the sides.

The same preparation makes first-rate paving for BARNS, CATTLE-SHEDS, FARM-YARDS, and all other situations where a clean, hard bottom is a desideratum. May be laid in winter equally well as in summer.

Manufacturers of the Cement, J. B. WHITE & BROTHERS, Milbank Street, Westminster.

COWS.

HARVEY'S CELEBRATED COW DRINKS, 1s. each, have been used with great success. Plain directions are given with each Drink for the treatment of most diseases incidental to Cows, for which they will be found a safe and effectual remedy. One Drink given at the commencement of the Tick, or Feet and Mouth Distemper, will perfectly eradicate it in a few days.—Compounded by R. HARVEY, Veterinary Surgeon, Macclesfield, Cheshire. Sold by all Medicine Vendors. Wholesale Agents, BARCLAY & SONS, and MARSDEN & SONS, London.

TO NERVOUS SUFFERERS.

A RETIRED CLERGYMAN having been restored to health in a few days, after many years of great nervous suffering, is anxious to communicate to others the means of cure; he will therefore send (free), on receiving a stamped envelope, properly addressed, a copy of the prescription used.—Direct Rev. E. DOUGLASS, 18, Holland Street, Brixton, London.

DR. DE JONGH'S

LIGHT BROWN COD LIVER OIL.—This OIL, long known, extensively prescribed, and highly appreciated on the Continent, has now, in consequence of its proved superior power and efficacy, acquired the general and entire confidence of the medical profession in this country. It is of the purest and finest quality, free from admixture and adulteration, or the usually repulsive and nauseous flavour, or sickly after-taste of the pale Oil, or of the coarse brown Oil commonly sold, though totally unfit for medicinal use. It is as low in price per ounce as any other genuine Cod Liver Oil, whilst its regular and speedy effects render it incalculably cheaper. Medical and scientific testimonials of the highest character delivered or forwarded gratis on application.—Sold in bottles, capsuled and labelled, with Dr. De Jongh's stamp and signature, WITHOUT WHICH NONE ARE GENUINE, by ANSAR, HARFORD, & CO., 77, STRAND, London, Dr. De Jongh's sole accredited Agents; and by respectable Chemists in Town and Country. Half-pints (10 oz.), 2s. 6d.; Pints (20 oz.), 4s. 9d.; Quarts (40 oz.), 9s.; IMPERIAL MEASURE.

THE COMING PILL.—"THE RIGHT PILL FOR EVERY COMPLAINT!"—PAGE WOODCOCK'S WIND PILLS for Wind in the Stomach, Indigestion, Biliousness, Liver Complaints, and all diseases arising from a disordered state of the Stomach and Bowels, will beat the World for efficacy! Try them, and you will say you have got the right Pill this time.—Sold by all respectable Medicine Vendors everywhere, at 1s. 1½d., 2s. 9d., and 4s. 6d. If difficulty occur in remote places, send stamps to PAGE D. WOODCOCK, Lincoln, and you will have them by return of Post.

HOLLOWAY'S PILLS A SUPERIOR MEDICINE FOR THE CURE OF STOMACH COMPLAINT.—These invaluable Pills surpass all other medicines in the cure of every complaint incidental to the human frame, especially to persons of debilitated constitutions, while to those suffering from derangements of the stomach, or with disorders of the liver or kidneys, there is nothing to equal them, as they can be taken by both sexes at any age with the utmost safety. Thousands of persons can testify to their efficacy, having been restored to sound health by taking them after every other remedy had been used in vain.—Sold by all Medicine Vendors, and at Professor HOLLOWAY'S Establishments, 244, Strand, London, and 80, Maiden Lane, New York.

TO LADIES.

PARR'S LIFE PILLS are especially efficacious in all the variety of ailments incidental to the fair sex. Ladies even of the most delicate constitutions will find them particularly beneficial, both before and after confinement; and for general use in schools they cannot be too strongly recommended. They mildly and speedily remove all skin eruptions, sallowness of complexion, nervous irritability, sick headache, costiveness, depression of spirits, irregularity, or general derangement of the system, and by assisting the secretions, give such a healthy action to the organs as to give the colour of the rose to the complexion, and tone and vigour to the whole frame.

Sold by E. EDWARDS, 67, St. Paul's Churchyard; BARCLAY & SONS, Farringdon Street; SUTTON & Co., Bow Churchyard; HANNAY & Co., 63, and SANGER, 150, Oxford Street, London; and by all respectable Chemists and Medicine Vendors in Town and Country.—In boxes, price 1s. 1½d., 2s. 9d., and in family packets, 11s. each.

NO MORE PILLS NOR ANY OTHER MEDICINE.—FOR INDIGESTION (DYSPEPSIA), CONSTIPATION, NERVOUS, BILIOUS, AND LIVER COMPLAINTS, COUGH, ASTHMA, BRONCHITIS, CONSUMPTION, AND DEBILITY.

DU BARRY'S delicious REVALENTA ARABICA FOOD saves 50 times its cost in Medicine, and cures the above complaints and their consequences, such as flatulency, distension, acidity, heartburn, palpitation of the heart, nervous headaches, deafness, noises in the head and ears, pains at the pit of the stomach and between the shoulders, diarrhœa, dysentery, impurities and poverty of the blood, scrofula, asthma, dropsy, rheumatism, gout, nausea and sickness during pregnancy, after eating, or at sea; low spirits, spasms, cramps, epileptic fits, spleen, general debility, inquietude, sleeplessness, involuntary blushing, paralysis, tremors, dislike to society, unfitness for study, loss of memory, delusions, vertigo, blood to the head, exhaustion, melancholy, groundless fear, indecision. It is moreover the best food for infants and invalids generally, as it never purges or turns acid on the weakest stomach, nor interferes with a good liberal diet, but imparts a healthy relish for lunch and dinner, and restores the faculty of digestion, and nervous and muscular energy to the most enfeebled.

BARRY, DU BARRY & Co., 77, Regent Street, London.

A few out of 50,000 cures are here given:—

Cure No. 71, of Dyspepsia, from the RIGHT HON. THE LORD STUART DE DECIES, "I have derived considerable benefit from Du Barry's Revalenta Arabica Food, and consider it due to yourselves and to the public to authorise the publication of these lines. STUART DE DECIES."

From the DOWAGER COUNTESS OF CASTLESTUART.

Cure 52,612.—"Rosstrevor, County of Down, Ireland, Dec. 9, 1854.—The Dowager Countess of Castlestuart feels induced, in the interest of suffering humanity, to state that Du Barry's excellent Revalenta Arabica Food has cured her, after all Medicines had failed, of Indigestion, Bile, great nervousness and irritability of many years standing. This Food deserves the confidence of all sufferers, and may be considered a real blessing. Enquiries will be cheerfully answered."

Cure No. 49,832.—"Fifty years indescribable agony from dyspepsia, nervousness, asthma, cough, constipation, flatulency, spasms, sickness at the stomach and vomiting, have been removed by Du Barry's excellent food.

"MARIA JOLLY, Wortham Ling, near Diss, Norfolk."

Cure 52,422. "Bridgehouse, Frimley, April 3d, 1854.

"I have suffered these 33 years continually from diseased lungs, spitting of blood, liver derangement, deafness, singing in the ears, constipation, debility, shortness of breath, and cough, and during that period taken so much medicine that I can safely say I have laid out upwards of a thousand pounds at the chemist's and doctor's. Indeed I was in utter despair, and never expected to get over it, when I was fortunate enough to become acquainted with your Revalenta Arabica, which, Heaven be praised, restored me to a state of health which I long since despaired of attaining. My lungs, liver, stomach, head, and ears are all right, my hearing perfect, and my recovery is a marvel to all my acquaintances.

"JAMES ROBERTS, Wood Merchant."

From the VENERABLE ARCHDEACON of ROSS.

No. 32,836.—"Three years excessive nervousness, with pains in my neck and left arm, and general debility, which rendered my life very miserable, has been radically removed by Du Barry's health restoring food. ALEX. STUART."

Cure 48,615. "Plymouth, May 9th, 1851.

"For the last 10 years I have been suffering from dyspepsia, headaches, nervousness, low spirits, sleeplessness, and delusions, and swallowed an incredible amount of medicine without relief. I am happy to say that your Food has cured me, and I am now enjoying better health than I have had for many years past.

"J. S. NEWTON."

Cure No. 180.—"25 years nervousness, constipation, indigestion, and debility, from which I have suffered great misery, and which no medicine could remove or relieve, have been effectually cured by Du Barry's Food in a very short time.

"W. R. REEVES, Pool Anthony, Tiverton."

No. 4208.—"Eight years dyspepsia, nervousness, debility with cramps, spasms, and nausea, have been effectually removed by Du Barry's health-restoring food. I shall be happy to answer any inquiries.

"Rev. JOHN W. FLAVELL, Ridlington Rectory, Norfolk."

No. 42,130, Major General King, cure of general debility and nervousness. No. 32,110, Captain Parker D. Bingham, R.N., who was cured of 27 years' dyspepsia in six weeks time. Cure No. 28,416, William Hunt, Esq., Barrister-in-law, 60 years' partial paralysis. No. 32,814, Captain Allen, recording the cure of a lady from epileptic fits. No. 26,419, the Rev. Charles Kerr, a cure of functional disorders. No. 24,814, the Rev. Thomas Minster, cure of five years' nervousness, with spasms and daily vomitings. No. 41,617, Dr. James Shorland, late surgeon in the 96th Regiment, a cure of dropsy.

No. 37,403, Samuel Laxton, Esq., a cure of two years' diarrhœa. Mr. William Martin, a cure of eight years' daily vomiting. Richard Willoughby, Esq., a cure of many years' biliousness.

No. 58,034.—"Grammar School, Stevenage, December 16, 1850. "Gentlemen,—We have found it admirably adapted for infants. Our baby has never once had disordered bowels since taking it.

"R. AMBLER."

"59, Union Street, Third District, New Orleans, Mar. 13, 1855.

"Dear Sir—Since 1838 I had been afflicted with a complaint that neither I nor my physician could qualify. It first began by an excessive thirst, so that I was fain to drink daily from 30 to 40 tumblers of water, the greatest thirst being during the digestive process. A strange feeling above the fundament followed that unusual thirst. It came on with intolerable itchings, and next as if an edged tool was cutting into it. Afterwards as if a full-grown crab's claw were steadily pinching at me. These symptoms were followed by colic, and finally by a diarrhœa. Originally these paroxysms came on yearly; after a while, several times in the course of the year; and for some years back almost every month, until at last every week. So that for seventeen years I have been labouring under an insufferable affliction, deprived of sleep, and so dizzy at times that I could not help myself; my stomach would fail me, and I thus became a helpless enervated invalid At last on the 15th of June, 1854, I was taken down with an alvine flux and killing pains in the bowels. Often as I went to bed at night I thought I should never see the morning. My medical attendant and friend, in whom was all my trust, concluding that he could do nothing to alleviate my sufferings (I thought so, at least), under colour of being himself unwell, sent me to one of his colleagues, whose attendance proved as unsuccessful; all the remedies prescribed failing to afford me any relief. It was at this stage of my disease that, on the 5th of September last, I luckily met one of my friends, who told me that Mr. J. B. Monier had passed through the same ordeal, and had been radically cured by Du Barry's Revalenta Arabica. Thereupon I immediately began to make use of it, and soon after felt relieved; and the extraordinary change for the better I have gradually experienced since, owing to that excellent farina, induces me to believe that I am completely cured. However as mine was a chronic disorder, I still keep taking the Revalenta, and will do so for some time yet, to insure a permanent return to health. Hoping that this statement may serve the cause of humanity, I cheerfully make it, and remain, yours respectfully, F. B. BERNARD,"

Commercial Abstract Clerk in the Collector's Office.

1 lb., 2s. 9d.; 2 lbs., 4s. 6d.; 5 lbs., 11s.; 12 lbs., 22s. Superfine, 1 lb., 6s.; 2 lbs., 11s.; 5 lbs., 22s.; 10 lbs., 33s. The 10 lbs. and 12 lbs. carriage free on receipt of Post-office Order.

BARRY, DU BARRY, & Co., 77, Regent Street, London. London Agents, FORTNUM, MASON, & Co., Purveyors to her Majesty, 182, Piccadilly; and also at 60, Gracechurch Street; 49, Bishopsgate Street; 4, Cheapside; 330, and 451, Strand; 55, Charing Cross.

BARRY, DU BARRY, AND CO., 77, Regent Street, London.

COMFORT IN THE RAIN.

BERDOE'S VENTILATING WATERPROOF LIGHT OVERCOATS AND CAPES resist any amount of rain, without confining perspiration (the fatal objection to all other Waterproofs), are intended for general use, equally as for rainy weather, and have long been reputed among the most valuable and economical garments ever invented. Capes, 30s. to 40s.; Coats, 40s. to 50s.—W. BERDOE, 96, New Bond Street, and 69, Cornhill (only).

ONE THOUSAND BEDSTEADS TO CHOOSE FROM.—HEAL AND SON have just erected extensive Premises, which enable them to keep upwards of 1000 Bedsteads in stock, 150 of which are fixed for inspection, comprising every variety of Brass, Wood, and Iron, with Chintz and Damask Furnitures complete. Their new Warerooms also contain an assortment of BED-ROOM FURNITURE, which comprises every requisite, from the plainest japanned deal for servants' rooms, to the newest and most tasteful designs in mahogany and other woods. The whole warranted of the soundest and best manufacture. HEAL AND SON'S ILLUSTRATED CATALOGUE OF BEDSTEADS AND PRICED LIST OF BEDDING sent free by post.—HEAL AND SON, 196, Tottenham Court Road.

FENDERS, STOVES, AND FIRE-IRONS.—Buyers of the above are requested, before finally deciding, to visit WILLIAM S. BURTON'S SHOW ROOMS, 39, Oxford Street (corner of Newman Street), Nos. 1, 2, and 3, Newman Street, and 4 and 5, Perry's Place. They are the largest in the world, and contain such an assortment of FENDERS, STOVES, RANGES, FIRE-IRONS, and GENERAL IRONMONGERY as cannot be approached elsewhere, either for variety, novelty, beauty of design, or exquisiteness of workmanship. Bright Stoves, with bronzed ornaments and two sets of bars, 2l. 14s. to 5l. 10s.; ditto, with ormolu ornaments and two sets of bars, 5l. 10s. to 12l. 12s.; Bronzed Fenders complete, with standards, from 7s. to 3l.; Steel Fenders from 2l. 15s. to 6l.; ditto, with rich ormolu ornaments, from 2l. 15s. to 7l. 7s.; Fire-irons from 1s. 9d. the set to 4l. 4s. Sylvester and all other Patent Stoves, with radiating hearth plates. All which he is enabled to sell at these very reduced charges,

1st,—From the frequency and extent of his purchases; and,

2dly,—From those purchases being made exclusively for cash.

BATHS AND TOILETTE WARE.—WILLIAM S. BURTON has ONE LARGE SHOW ROOM devoted exclusively to the DISPLAY of BATHS and TOILETTE WARE. The stock of each is at once the largest, newest, and most varied ever submitted to the public, and marked at prices proportionate with those that have tended to make his establishment the most distinguished in this country. Portable Showers, 7s. 6d.; Pillar Showers, 3l. to 5l.; Nursery, 15s. to 32s.; Sponging, 15s. to 30s.; Hip, 14s. to 31s. 6d. A large assortment of Gas Furnace, Hot and Cold Plunge, Vapour, and Camp Shower Baths. Toilette Ware in great variety, from 15s. 6d. to 45s. the Set of Three.

THE BEST SHOW OF IRON BEDSTEADS in the Kingdom is WILLIAM S. BURTON'S.—He has two very Large Rooms, devoted to the exclusive show of Iron and Brass Bedsteads and Children's Cots, with appropriate Bedding and Mattresses. Common Iron Bedsteads, 18s.; Portable Folding Bedsteads from 12s. 6d.; Patent Iron Bedsteads, fitted with dovetail joints and patent sacking, from 17s. 6d.; and Cots from 20s. each; handsome Ornamental Iron and Brass Bedsteads, in great variety, from 2l. 13s. 6d. to 15l. 15s.

PAPIER MACHE AND IRON TEA-TRAYS.—An assortment of Tea Trays and Waiters wholly unprecedented, whether as to extent, variety, or novelty.

New oval Papier Maché Trays, per set of three	from 20s. to 10 guineas.
Ditto, Iron ditto	from 13s. to 4 guineas.
Convex shape, ditto.	from 7s. 6d.

Round and Gothic Waiters, Cake and Bread Baskets equally low.

WILLIAM S. BURTON has SIXTEEN LARGE SHOW ROOMS, all communicating, exclusive of the Shop, devoted solely to the show of GENERAL FURNISHING IRONMONGERY (including Cutlery, Nickel Silver, Plated and Japanned Ware, Iron and Brass Bedsteads and Bedding), so arranged and classified that purchasers may easily and at once make their selections.

Catalogues, with engravings, sent (per post) free. The money returned for every article not approved of.

No. 39, Oxford Street (corner of Newman Street); 1, 2, and 3, Newman Street; and 4 & 5, Perry's Place.

NO CHARGE FOR STAMPING at LOCKWOOD'S, 75, New Bond Street. Good cream-laid Note-paper, five quires for 9d.; Thick ditto, five quires, 1s.; Albert and Queen's sizes, five quires for 6d., 9d., and 1s.; Note-paper made from Straw, 2s. 6d. per ream; Envelopes, 4d. to 1s. 6d. per hundred; Foolscap paper, 7s. 6d. per ream; Copybooks 2s. 6d. per dozen. Card Plate engraved, 2s. 6d.; 100 Cards printed, 2s. 6d. Wedding orders promptly executed. LOCKWOOD'S celebrated Nugget (gold) Pen, 1 doz. post free for 13 stamps.

METCALFE AND CO.'S NEW PATTERN TOOTH BRUSH, PENETRATING HAIR BRUSHES, AND SMYRNA SPONGES.—The Tooth Brush performs the highly important office of searching thoroughly into the divisions and cleansing in the most extraordinary manner—hairs never come loose. Peculiarly penetrating Hair Brushes, with durable unbleached Russian bristles, which will not soften like common hair, and immense stock of genuine unbleached Smyrna Sponge, with every description of British and Foreign Perfumery at METCALFE, BINGLEY, & Co.'s only Establishment, 130 B and 130, Oxford Street, second and third doors west from Holles Street.

CAUTION.—Beware of the word "from" Metcalfe's, adopted by some houses. Metcalfe's Alkaline Tooth Powder, 2s. per box.

THE SUCCESSFUL RESULTS OF THE LAST HALF CENTURY HAVE PROVED BEYOND QUESTION THAT ROWLAND'S MACASSAR OIL possesses peculiarly nourishing powers in the growth, restoration, and improvement of the human Hair, and is now universally acknowledged to be the cheapest, and superior to all other preparations for the hair. It prevents it from falling off or turning grey, strengthens weak hair, produces a thick and luxuriant growth, cleanses it from scurf and dandriff, and makes it beautifully soft, curly, and glossy. In the growth of the Beard, Whiskers, Eyebrows, and Moustachios, it is unfailing in its stimulative operation. For children it is especially recommended, as forming the basis of a beautiful head of hair. Price 3s. 6d. and 7s.; Family Bottles (equal to four small), 10s. 6d.; and double that size, 21s. CAUTION.—On the wrapper of each bottle are the words, Rowlands' Macassar Oil. In two lines.—Sold by A. ROWLAND & SONS, 20, Hatton Garden, London, and by Chemists and Perfumers.

DO YOU WANT LUXURIANT HAIR, WHISKERS, &c.?—No other compound for the Hair has maintained such an enduring celebrity as EMILY DRAW'S CRINILENE. It is guaranteed to produce Whiskers, Moustachios, Eyebrows, &c., in a few weeks, and restore the Hair in Baldness, from whatever cause, strengthen it when weak, prevent its falling off, and effectually check Greyness in all its stages.—Price 2s. per package (elegantly perfumed); sent post free, on receipt of 24 penny postage stamps, by Miss DRAW, 37 A, Manchester Street, Gray's Inn Road, London. Sold by every Chemist in the world.—"In one fortnight it produced a beautiful set of moustachios." H. ADAMS.—"It has prevented my hair falling off." J. HICKSON.—"It has quite checked the greyness that was coming on." MRS. ELDER.

Beware of imitations under closely similar names.

This day is published, price 4s. 6d. bound, with an Illustrated Cover by J. Tenniel,

Just published, the 33d edition, price 1d.,

GRIMSTONE'S HISTORY of an EGYPTIAN PEA, discovered by the Committee of the British Museum in a Vase sent by Sir Gardner Wilkinson, the Egyptian Traveller. Three were presented to Mr. W. Grimstone by Mr. T. I. Pettigrew, who opened this relic, being 2844 years old. The growth of this Pea is different to those of this country; the taste is delicious: they boil much greener than ours, and so prolific. They are planted thus . . . . eight inches apart: the 2s. 6d. bag will produce enough for a small family. They require no sticks. Planted between December and July. The only genuine is sold in bags, 2s. 6d.; three times the quantity, 5s.; seven times the quantity, 10s. Each bag is signed and sealed by William Grimstone, Herbary, Highgate; depôt, 52, High Street, Bloomsbury, London, Eye Snuff and Herb Tobacco Warehouse, 3d. per oz.

RALPH'S ENVELOPE PAPER, reduced prices, 6s., 8s., and 9s. 6d. per ream; samples on application.
F. W. Ralph, Manufacturer, 36, Throgmorton Street, Bank.

GLENFIELD PATENT STARCH,
USED IN THE ROYAL LAUNDRY,
and pronounced by HER MAJESTY'S LAUNDRESS to be THE FINEST STARCH SHE EVER USED.
Sold by all Chandlers, Grocers, &c. &c.

A CLEAR COMPLEXION.

GODFREY'S EXTRACT of ELDER FLOWERS is strongly recommended for softening, beautifying, and preserving the skin, and giving it a blooming and charming appearance, being at once a fragrant Perfume and delightful Cosmetic. It completely removes tan, sun-burn, redness, &c., and by its balsamic and healing qualities renders the skin soft, and free from dryness, scurf, &c.; clears it from every humour, pimple, or eruption; and by continuing its use only a short time the skin becomes and continues soft and smooth, and the complexion clear and beautiful. In the process of shaving it is invaluable, as it annihilates every pimple and all roughness, and affords great comfort if applied to the face during cold easterly winds.—Sold in Bottles, price 2s. 9d., with directions for using it, by all Medicine Vendors and Perfumers.

DINNEFORD'S PURE FLUID MAGNESIA has been for many years sanctioned by the most eminent of the Medical Profession, as an excellent remedy for Acidities, Heartburn, Headache, Gout, and Indigestion. As a mild aperient, it is admirably adapted for delicate females, particularly during pregnancy; and it prevents the food of infants from turning sour during digestion. Combined with the Acidulated Lemon Syrup, it forms an Effervescing Aperient Draught, which is highly agreeable and efficacious.—Prepared by Dinneford & Co., Dispensing Chemists (and General Agents for the Improved Horse-Hair Gloves and Belts), 172, New Bond Street, London, and Sold by all respectable Chemists throughout the Empire.

RUPTURES EFFECTUALLY CURED WITHOUT A TRUSS.—All sufferers from this alarming complaint are earnestly invited to consult or write to Dr. LESLIE, as he guarantees them relief in every case. His remedy has been successful in curing thousands of persons during the last twelve years, and is applicable to every kind of single and double rupture, however bad or long standing, in male or female of any age, causing no confinement or inconvenience in its use whatever. Sent post free to any part of the world, with full instructions for use, on receipt of 7s. 6d. in postage stamps, or post-office order, payable at the General Post-office, to Dr. Herbert Leslie, 37A, Manchester Street, Gray's Inn Road, London. At home daily (except Sunday) from 11 till 4 o'clock. A Pamphlet of Testimonials, cases, &c., sent post free on receipt of one postage stamp.

DORKING FOWLS.

TO BE SOLD, a COCK and SEVEN HENS of a favourite breed.—For price, &c., address D. L., *Essex Gazette* Office, Colchester.

DORKING BLUE MOTTLED FOWLS' EGGS 12s. per dozen. Took first Prize at Brighton Exhibition of three counties, 1854.—Address Mr. Ed. Henden, Beehive Inn, Dorking, Surrey.

GOLDEN SPANGLED HAMBURGHS.—Eggs (fresh) from first-rate Birds, at 10s. per set of 13.—Address Mr. John Compton, Portchester, Fareham, Hants.

TO GARDENERS, FLORISTS, ETC.
Acacia Road, St. John's Wood, near Regent's Park.

TO BE LET, on lease or otherwise, with immediate possession, the ACACIA ROAD NURSERY, situated in a first-rate neighbourhood for business, containing Greenhouses, Pits, and Frames, and every convenience for carrying out a good business. The Stock, containing many choice and various Plants in pots, &c., will be disposed of at a low rate. There is an excellent Residence with Coach and Potting Houses, also an Office and Seed Shop on the grounds; the whole well worthy attention, and will be disposed of at a very low rate. It may be viewed by applying as above.

CHEAP BEDDING PLANTS.

Sales by Auction.

ORCHIDS AND SEEDS FROM INDIA AND THE BRAZILS.

MR. J. C. STEVENS will sell by Auction at his Great Room, 38, King Street, Covent Garden, on MONDAY, 4th June, at 12 for 1 o'clock, East Indian Orchids, an importation just received per overland route, including a new Yellow Vanda from the Naga Hills, two new Dendrobes from the Bootan Hills and upper Assam, and numerous Plants of Ærides, Saccolabium, Dendrobium, &c. Also an importation from the Brazils of Cattleya Leopoldi, Lælia purpurata, &c.; and a box of Seeds of Forest Trees, Shrubs, Creepers, and Flowers, from the East Indies.—May be viewed on the morning of Sale, and Catalogues had of Mr. J. C. Stevens, 38, King Street, Covent Garden.

TO GENTLEMEN, FLORISTS, AND OTHERS.

MESSRS. PROTHEROE and MORRIS will Sell by Auction, at the Mart, Bartholomew Lane, on WEDNESDAY and FRIDAY, June 6 and 8, at 12 o'clock, a first-class Collection of Dahlias, choice Roses, Petunias, Fuchsias, Verbenas, Calceolarias, Azalea indica, choice Geraniums, and other Plants in bloom, with a large assortment of Ornamental Plants for Bedding.—On view mornings of sale; Catalogues had at the Mart, and of the Auctioneers, American Nursery, Leytonstone, Essex.

WIMBLEDON HOUSE, SURREY.
Fine Collection of Orchidaceous, Stove, and Greenhouse Plants.

MESSRS. RUSHWORTH and JARVIS beg to notify that the seventh day's sale of the effects of the late Mrs. Marryat, on the premises, Wimbledon House, on WEDNESDAY, June 6th, will comprise the collection of Orchids including some rare and valuable specimens, large Orange and Lemon Trees, Camellias, Azaleas, Ericas, Aloes, Cacti, &c., a large quantity of healthy Bedding Plants, also handsome Stone and Composition Vases and Pedestals, Wire Borders and Trainers, Garden Implements, Frames, and Hand Glasses. Catalogues on the premises, and at the Offices of Messrs. Rushworth & Jarvis, Saville Row, Regent Street; and 19, Change Alley, Cornhill.

TO FARMERS, HORSE MASTERS, &c.

MR. G. COLLIS will Sell by Auction, unless disposed of by private contract, on WEDNESDAY, June 6th at the Lion Inn, Romford, Essex, a small POST WINDMILL, with a pair of 30-inch stones, which may grind, and kebble, and crush Wheat, Oats, and Barley, besides splitting Beans, from 1 to 3 bushels per hour. Originally cost upwards of 130*l.*, and is in pretty good condition. It stands in a field within a mile of Romford, and to be removed at expense of purchaser.—May be seen by applying to Mr. Collis, North St., Romford, Essex.

HORTICULTURAL BUILDING AND HEATING BY HOT WATER.

AT THE LOWEST PRICES CONSISTENT WITH GOOD MATERIALS & WORKMANSHIP.

GRAY & ORMSON, DANVERS STREET, CHELSEA, LONDON.

GRAY AND ORMSON, Danvers Street, Chelsea, having had considerable experience in the construction of Horticultural Erections, which, for elegance of design, good materials, and workmanship, combined with economy and practical adaptation, cannot be surpassed by anything of the kind in the country, are in a position to execute orders on the lowest possible terms.

G. & O. have been extensively employed by the Nobility, Gentry, and London Nurserymen; and they can with the greatest confidence give the most satisfactory references to all by whom they have been favoured with orders. Their Hot-water Apparatus is also constructed on the most approved and scientific principles, for all purposes to which the application of Heating by Hot Water can be made available.

COTTAM & HALLEN. ENGINEERS. FOUNDERS ETC

STEPHENSON AND PEILL, 61, Gracechurch Street, London, and 17, New Park Street, Southwark, Manufacturers of Copper Cylindrical and Improved Conical Iron BOILERS, and Conservatory and Hothouse Builders, either in Wood or Iron, respectfully call the attention of the Nobility, Gentry, and Nurserymen to their simple but efficacious method of warming Horticultural and other Buildings by Hot Water.

From the extensive works they have executed, references of the highest respectability can be given, and full particulars furnished on application.

"FRIGI DOMO."—Patronised by her Majesty the Queen, the Duke of Northumberland for Syon House, His Grace the Duke of Devonshire for Chiswick Gardens, Professor Lindley for the Horticultural Society, Sir Joseph Paxton for the Crystal Palace, Royal Zoological Society, Mrs. Lawrence, of Ealing Park, and — Collier, Esq., of Dartford.

PROTECTION FROM MORNING FROST.

"FRIGI DOMO," a Canvas made of patent prepared Hair and Wool, a perfect non-conductor of Heat and Cold, keeping, wherever it is applied, a fixed temperature. It is adapted for all horticultural and floricultural purposes, for preserving Fruits and Flowers from the scorching rays of the sun, from wind, from attacks of insects and from morning frosts. To be had in any required length, 2 yards wide, at 1s. 6d. per yard run, of ELISHA THOMAS ARCHER, whole and sole manufacturer, 7, Trinity Lane, Cannon Street, City, and the Royal Mills, Wandsworth, Surrey; and of all Nurserymen and Seedsmen throughout the kingdom. "It is much cheaper than mats as a covering."

HORTICULTURAL WORKS AND HOT-WATER APPARATUS MANUFACTORY.

KENSAL GREEN, HARROW ROAD, LONDON.

JOHN TAYLOR AND SON beg to call the attention of the nobility and gentry to the very superior manner in which they Erect all kinds of Conservatories, Vineries, Greenhouses, &c., combining every improvement with elegance of design, and durability of materials and workmanship.

Their VENTILATING APPARATUS for the Fronts and Roofs of Houses has given the highest satisfaction. Churches, Chapels, Schools, Entrance Halls, Public Buildings, &c., heated with Hot-Water Apparatus in a most economical and efficient manner. J. T. & SON have great pleasure in referring to numbers of the nobility and gentry by whom they are extensively engaged.

HORTICULTURE IN ALL ITS BRANCHES.

JOHN WEEKS & Co., King's Road, Chelsea.

HOTHOUSE BUILDERS.

THE NOBILITY AND GENTRY about to erect Horticultural Buildings, or fix Hot-water Apparatus, will find at our Horticultural Establishment and Hothouse Works, King's Road, Chelsea, an extensive variety of Hothouses, Greenhouses, Conservatories, Pits, &c., erected, and in full operation, combining all modern improvements, so that a lady or gentleman can select the description of House best adapted for every required purpose.

The HOT-WATER APPARATUS, which passes through all the Houses and Pits, affording both top and bottom heat, is in constant operation and particularly worthy of attention.

Many of the Houses and Pits are of wide and lofty dimensions and together equal in length 1000 feet. They are all effectually heated by *one boiler*, which, during the severe winter months does not cost in labour and fuel more than 3s. 8d. per day, and the apparatus is so arranged that each House or Pit may be heated separately and to the required temperature. The splendid collections of Stove and Greenhouse Plants are also in the highest state of cultivation, and for sale at very low prices. Also a fine collection of strong Grape Vines in pots, from eyes, all the best sorts.

Plans, Models, and Estimates of Horticultural Buildings also. Catalogues of Plants, Vines, Seeds, &c., forwarded on application to JOHN WEEKS & Co., King's Road, Chelsea, London.

HOTHOUSES, CONSERVATORIES, FRAMES & LIGHTS FOR PITS, CUCUMBER & MELON BOXES & LIGHTS.

JAMES WATTS, HOTHOUSE BUILDER, 8, Claremont Place, Old Kent Road, London.

Green and Hothouses, 9, 10, 11, 12, 13, and 14 feet wide, any length, from 16 to 100 feet. Frames and Lights for Pits, 6 ft. 6 in., 7 ft., 7 ft. 6 in., 8 ft., and 8 ft. 6 in. wide, any length, from 12 to 100 feet. Upwards of 200 Cucumber and Melon Boxes and Lights, from 4 ft. by 3 to 10 ft. 6 in. by 5 ft. 6 in., kept ready glazed with stout sheet glass, painted four times, complete, ready for immediate use, all made of best material, packed and sent to all parts of the kingdom.—Reference may be had to the Nobility, Gentry, and the Trade, in most of the counties in England.

BASS'S EAST INDIA PALE ALE, BASS'S MILD BURTON ALE, and BARCLAY'S PORTER and STOUT, in 18 gallon Casks, Bottles, Half-Bottles, and Imperial Pints.—BERRY, BROTHERS, & Co., 3, St. James's Street, London.

Sold in packages containing a sufficient quantity to plant 50 feet of bed for 5*s*., with printed description and cultural directions for the shed, the cellar, the garden, or the field. Post-office orders indispensable. Payable to WILLIAM PRESTOE, Basingstoke, Hants.

NEW SCARLET GERANIUM—EMPEROR NAPOLEON.

JOHN BUTCHER is now sending out the above splendid Geranium, a very decided improvement upon the great favourite Tom Thumb; the habit is more compact, the trusses of flowers very much larger, and for brilliancy of colour far superior; sending up the truss of flower finely above the foliage. Fine for Bedding or Vases. Good Plants, fit for immediate Bedding, 18*s*. per doz.; extra, 2*s*. 6*d*. each, basket included.—Nursery, Stratford-on-Avon, June 9.

MRS. CONWAY begs to offer the undermentioned choice Variegated Geraniums, &c., at the following reasonable prices:—

Brilliant ... 12s. to 18s. per doz.
Mountain of Light, 18s.
Kingsbury Pet, 9s. to 18s.
Trentham Rosy Scarlet, 1s. 6d. each.
Ivy-leaf Etoile de Vaise, 1s. do.
Flower of the Day, 6s. to 9s. per dozen.
Golden Chain, 12s. to 18s. do.
Skeltoni, 12s. do.
Scarlet Unique (Gaines), 5s. each.
Scarlet Ivy-leaf, 9s. per doz.
Impatiens jerdonice, 5s. each.
Philesia buxifolia, 10s. 6d. each.
Hydrangea japonica variegata, 1s. 6d. each.

Verbenas, Heliotropes, Calceolarias, Fuchsias, &c., 4s. to 6s. per dozen.—Earl's Court Nursery, Old Brompton.

ROBERT PARKER begs to inform his friends and the public that his New Spring Catalogue containing Descriptive and Priced Lists of the following:—

Exotic Orchids
Ferns—stove, greenhouse, and hardy
Geraniums—show, fancy, scarlet, variegated, and hybrid bedding varieties
Chrysanthemums—large flowered, and Pompone varieties
Petunias
Antirrhinums
Roses in pots [varieties
Dahlias — show and fancy
Fuchsias
Selaginillas or Lycopodiums
Gloxinias
Cinerarias
Calceolarias—bedding varieties
Verbenas
Miscellaneous bedding plants &c., &c.

Is now ready and can be had Post-free on application.
Paradise Nursery, Hornsey Road, Holloway, London.

MESSRS. E. G. HENDERSON AND SON beg to announce that their new Spring CATALOGUE for 1855 will be sent post free on application, and for 12 postage stamps a beautiful coloured plate representing the following choice plants:—

Achimenes Ambroise Verschaffelt.
Acacia Drummondi microphylla.
Boronia Drummondi.
Bouvardia longiflora.
Delphinium Hendersoni.
Genetyllis macrostegia (fuchsioides).
Fuchsia Queen Victoria.
——— Mrs. Story.
——— Prince Albert.

Mr. Andrews, the first floricultural artist of the day, has had the getting up of this plate, so that full reliance may be placed on the correctness of the flowers represented and the superior style of the colouring.

Description and Price of the following New Plants will be seen on reference to the Catalogue.

Fuchsia Queen Victoria.
" Prince Albert.
" Water Nymph.
" Raffaelle.
" Rouge et Blanc.
" Miellezi.
" Dominiana.
" Maid of Kent.
Geranium Rubens (bedding).
" Virginium.
" Masterpiece.
" Rose d'Amour.
Calceolaria Surprise.
" Purity.
" Maggiore.
" Norma.
" Vezzosa.
" Ajax.
Hydrangea hortensis flore pleno.
Lychnis Sieboldi.
Veronica imperial blue.
" Andersoni fol. variegata.
Begonia prestoniensis superba.
Lobelia Antwerpiensis.
Fuchsia Empress Eugenie.
" Lady of the Lake.
" Snowdrop.
" Mrs. Story.
" Princess of Prussia.
" Souvenir de la Reine.
" Climax.
Geranium Favourite (bedding).
" Silver Queen.

" Corregio.
" Minnie.
" Red Rover.
" Wildfire.
Phlox Queen Victoria.
Pyrethrum Delhayi.
" Duchesse de Brabant.
Achimenes Hendersoni.
" gigantea.
Scutellaria villosa.
Verbena la Déesse, and others recommended.

Chrysanthemum Hermine, Bole, and others recommended.
Wellington Nursery, St. John's Wood.

PLANTS OF CABBAGE, SAVOY, KAIL, BROCCOLI, AND CAULIFLOWER.

JOHN CATTELL begs respectfully to inform the public that he has a plentiful supply of Plants of his superior true sorts of the above, which will be forwarded to order on receipt of Postage Stamps, or Post Office Order made payable here, at the following prices, package included:—

All the sorts of Early Cabbage, Savoy, and Kail, including Brussel Sprouts, 6d. per 100, 4s 6d. per 1000; all the sorts of Broccoli, 8d. per 100, 5s. 6d. per 1000; Cauliflower, early and late 10d. per 100; Red Cabbage, 1s. per 100; Drumhead, or Cattle Cabbage, 4s. per 1000. A fine stock of autumn-bedded early Cabbage still to dispose of at 6s. per 1000; for large quantities, price on application. Packages containing plants to the value of 1l. and upwards will be delivered carriage free to London and to the Edenbridge Station of the South Eastern Railway. A remittance must accompany orders from unknown correspondents. Seed of Cattell's Dwarf Barnes, and of his superior Dwarf Reliance Cabbage, may be had in packets by post, for 12 penny stamps per packet, the former containing one ounce, and the latter half an ounce.—Nurseries, Westerham, Kent.

NEW BEDDING AND OTHER PLANTS
OFFERED BY

JOHN SCOTT, of the Merriott Nurseries, Crewkerne, Somerset.

VERBENA MISS LUCY.—A beautiful pink, with large truss, and a fine bedder.
" DAVIESI.—A first-rate variety, like Mrs. Mills, but large truss, and fine bedder.
" GENERAL PELISSIER.—Dark plum, very large, flat truss, finer in all its qualities than Andrew.
" ADMIRAL LYONS.—Light lilac, dark eye, extra large and fine.
" CERISE UNIQUE (Stewart's).—A splendid cherry-coloured flower, the finest of its class; 2s. 6d. each, or the set for 10s.
PETUNIA EMPEROR NAPOLEON.—Large, smooth dark crimson flower, with violet throat, the finest crimson yet raised, should be in every garden where a fine crimson bed is wanted.
" EMPRESS EUGENIE.—Bright ruby crimson, and peach, well worthy a place by the side of the Emperor; 3s. each, or 5s. the pair.
PELARGONIUM TRIANGULARE.—An interesting and rare species, of a climbing habit, will grow several feet in a year, and produces an abundance of beautiful and curious flowers, unlike any other species of this beautiful and numerous family; it is a native of the Cape of Good Hope, and will form a fine pillar in the flower garden during summer; 10s. 6d. each. One over to the trade when three are ordered.
RHODODENDRON GIBSONI.—The most beautiful white flowering kind in existence, far surpassing the White Azalea in size and form of its flowers; is perfectly hardy, having stood the test of last winter unharmed in small pots, the severest test a plant can have; 1s. 6d. to 5s. each. Also,
LUPINUS CALIFORNICUS.—A beautiful and new tree Lupin, with flowers like a Laburnum, and sweet scented; 5s. each. And
ALONSOA WARSCZEWICZI ... ... 12s. per dozen } Two
SABBATIA CAMPESTRIS ... ... 12s. .. } gems.

J. S. would call attention to his List of Bedding Plants in former Numbers of the *Gardeners' Chronicle*, and begs to say that he has still left many thousands; but these are being rapidly sold off, so that early application is necessary to procure fine plants.

J. S. has also now saved his Cineraria Seed from a splendid collection of flowers of unsurpassed beauty, and offers the same at 1s. 6d. per packet, post free. Now is the best time to sow to obtain large plants for winter and spring flowering.—June 9.

MAY'S MAGNUM BONUM LETTUCE is by far the largest, sweetest, and crispest Lettuce known, in proof of which we possess numerous letters received from parties who had it last season. The addresses of the writers can be had on application. It may be sown all the summer, and will stand the winter. Packets 1s. each.

HENRY MAY, the Hope Nurseries, near Bedale, Yorkshire.

ROGERS'S SEED DEPOT AND GARDENERS' REGISTRY OFFICE, Clock House, Chelsea.

A fine collection of PERENNIAL and BIENNIAL FLOWER SEEDS, including Choice CINERARIA, CALCEOLARIA, PRIMULA, &c., for JUNE SOWING.

N.B. Seed of the interesting BURNING BUSH Plant.

PAGE AND CO'S COMPOSITION FOR THE DESTRUCTION OF BLIGHT UPON ROSES, WALL-FRUIT TREES, CUCUMBERS, MELONS, VINES, STOVE AND GREENHOUSE PLANTS.—Extra Strong, 4s. per gallon, sufficient to make four (Jars and Barrels extra). Directions for use forwarded. Ten gallons and upwards carriage free to London.

After four years' extensive use by the most eminent Gardeners in the kingdom, the superiority of Page & Co.'s BLIGHT COMPOSITION is unquestionable, requiring only a trial to insure its general use for destroying every pest to which Plant and Fruit Growers are subject (without injuring the most delicate flowers or foliage) and promoting a luxuriant growth.

See two pages Testimonials, *Gardeners' Chronicle*, March 3, 1855.

IMPORTANT TO GROWERS OF ROSES.

NEWLY-INVENTED APHIS BRUSH, OR GREEN FLY DESTROYER.—The attention of Florists is particularly called to this Cheap and Ingenious Instrument, invented by the Rev. E. S. Bull, of Colchester, which, in a very simple and easy manner, instantly cleanses the Rose from that destructive insect the Green-fly (or Aphis), without causing the slightest injury to the bud or foliage.

Price 2s. 6d. each, or free by post, 4s.

Manufactured by
JOSLIN AND SONS,
Ironmongers, Colchester.

Retailed by all the principal Ironmongers.
Wholesale Agents:
W. Thompson & Son, 15, Upper North Place, Gray's Inn Road, London.

GARDEN VASES, FOUNTAINS, ETC.

THOMAS SOMMERVILLE, Landscape Gardener, Nurseryman, Seedsman, and Florist, Garden Road, St. John's Wood, London, begs respectfully to inform the nobility, gentry, and his patrons generally, that he has entered into arrangements with an eminent company in Scotland for the sole disposal in London of their highly ornamental and very durable Vases, Fountains, &c., samples of which may be seen at his grounds in the Garden Road, as above.

T. S. has much pleasure in being the first to introduce to the notice of the public a highly ornamental Vase, capable of resisting the most severe weather, and at little more than half the cost of any other possessing the same qualities; and he has no hesitation in stating that a more suitable Vase for the growth of plants cannot be manufactured.

DEANE'S WARRANTED GARDEN TOOLS.—Horticulturists and all interested in Gardening pursuits are invited to examine DEANE, DRAY, AND CO.'S extensive Stock of GARDENING and PRUNING IMPLEMENTS, best London-made Garden Engines and Syringes, Colebrook Dale Garden Seats and Chairs.

HORTICULTURAL WORKS AND HOT-WATER APPARATUS MANUFACTORY.
Kensal Green, Harrow Road, London.

JOHN TAYLOR AND SON beg to call the attention of the nobility and gentry to the very superior manner in which they Erect all kinds of Conservatories, Vineries, Greenhouses, &c., combining every improvement with elegance of design, and durability of materials and workmanship.

Their VENTILATING APPARATUS for the Fronts and Roofs of Houses has given the highest satisfaction. Churches, Chapels, Schools, Entrance Halls, Public Buildings, &c., heated with Hot-Water Apparatus in a most economical and efficient manner. J. T. & Son have great pleasure in referring to numbers of the nobility and gentry by whom they are extensively engaged.

HORTICULTURE IN ALL ITS BRANCHES.

JOHN WEEKS & Co., King's Road, Chelsea,

HOTHOUSE BUILDERS.

THE NOBILITY AND GENTRY about to erect Horticultural Buildings, or fix Hot-water Apparatus, will find at our Horticultural Establishment and Hothouse Works, King's Road, Chelsea, an extensive variety of Hothouses, Greenhouses, Conservatories, Pits, &c., erected, and in full operation, combining all modern improvements, so that a lady or gentleman can select the description of House best adapted for every required purpose.

The HOT-WATER APPARATUS, which passes through all the Houses and Pits, affording both top and bottom heat, is in constant operation and particularly worthy of attention.

Many of the Houses and Pits are of wide and lofty dimensions, and together equal in length 1000 feet. They are all effectually heated by *one boiler*, which, during the severe winter months does not cost in labour and fuel more than 3s. 8d. per day, and the apparatus is so arranged that each House or Pit may be heated separately and to the required temperature. The splendid collections of Stove and Greenhouse Plants are also in the highest state of cultivation, and for sale at very low prices. Also a fine collection of strong Grape Vines in pots, from eyes, all the best sorts.

Plans, Models, and Estimates of Horticultural Buildings, and Catalogues of Plants, Vines, Seeds, &c., forwarded on application to John Weeks & Co., King's Road, Chelsea, London.

MOORE'S PATENT VENTILATOR, for every Description of Farm-Buildings, Conservatories, Hot-houses, Warehouses, Market-houses, Bell-turrets, also for Ventilating Shafts, &c.

These Ventilators are fitted to side-slips of wood with iron levers, iron flanges, and brass screws, with rough plate, or 21oz. sheet glass, at 4s. per foot super. 2s. 6d. extra for necessary fittings to each Ventilator. If with brass levers in place of iron, 4s. per pair extra. It is presumed the accompanying drawing of a Greenhouse will show the advantages obtained independent of a most perfect system of Ventilation, by admitting any amount of fresh air and distributing equally over the plants, &c., and at the same time emitting the vitiated), viz., a much neater appearance, and an uninterrupted view of the whole interior. Greenhouses at Mr. James Veitch, Jun., Exotic Nursery, King's Road, Chelsea; Messrs. Veitch & Sons, Nursery, Exeter; Messrs. Perry, Nursery, Banbury; and the Pleasure Grounds at Hampton Court Palace; having been fitted with these Ventilators with perfect success, the Patentee has obtained permission to refer to the above places all parties desirous of seeing the same.

These Ventilators have been applied to many other Greenhouses, Conservatories, &c., but they are not published, in order to avoid giving unnecessary trouble. Fifty-four of these Ventilators, 5 ft. square (34 on the roof at an angle of 60 degrees), have been fitted at Her Majesty's Saltpetre Works, Waltham Abbey, the success of which has been proved by the fact, that the saltpetre is cry-talised in little more than half the time, previously to the light and ventilation obtained by the adoption of these Ventilators.

Moore's double-current Ventilators for External Walls, &c. Ventilators for every description of apartment, from the Cottage to the Palace. Stained and Ornamental Glass if required. In taking the size, the exact opening should be given, stating the height and width distinctly. Tariff Prices of the above Ventilators may be had on application at either of the above addresses. Packing cases allowed full price when returned free.

N.B.—These Ventilators can be readily fitted to Greenhouses already erected, by removing the entire sashes and fixing the Ventilators in their places.

Perfect Ventilation in all Cases Guaranteed.

Church, Turret, Musical and House Clock Makers, to the Lords of the Admiralty, the Hon. Board of Ordnance, the Emperor of China, &c.

London: 81, Fleet Street, London.—Manufactory, Sekford Works, Clerkenwell.

TRELOAR'S COCOA-NUT FIBRE MANUFACTURES, consisting of MATTING, MATS, MATTRESSES, BRUSHES, NETTING, HORSE-HAIR, and BRISTLE SUBSTITUTE, are distinguished for superiority and excellence of workmanship, combined with moderate prices. Prize Medal awarded in England and America at the Exhibition of all Nations.

T. Treloar, Cocoa-nut Fibre Manufacturer, 42, Ludgate Hill, London.

TURNIP SEEDS FOR PRESENT SOWING.

As some kinds of Turnips produce much heavier crops and of more nutritive properties than others, Messrs. Sutton desire at this sowing season to recommend the undermentioned in preference to all others.

A GALLON OF TURNIP SEED WEIGHS ABOUT 6½ lbs.

PRICES FOR THE MONTH OF JUNE.

SUTTON'S EARLY SIX-WEEKS TURNIP, the earliest Turnip known.—To be sown in June, July, August, and September, for early feed, and for winter and spring. 1*s.* per lb., 6*s.* per gallon.

POMERANIAN WHITE GLOBE, very large.—Sow in June and July. 1*s.* per lb., 6*s.* per gallon.

IMPROVED ORANGE JELLY (from selected roots).—If sown in June or July, this produces a heavy crop of highly nutritive Turnips, but it is uncertain if sown later. 1*s.* 2*d.* per lb., 7*s.* per gallon.

SUTTON'S PURPLE TOP YELLOW HYBRID, an excellent substitute for Swedes.—Sow in June and July for winter or spring feeding, 1*s.* 6*d.* per lb., 9*s.* per gallon.

SUTTON'S GREEN TOP YELLOW HYBRID, equal to a fine Yellow Swede.—Sow in July and August for winter and spring feeding. 1*s.* 6*d.* per lb., 9*s.* per gallon.

SUTTON'S IMPERIAL GREEN GLOBE, very fine, best for the main crop.—To be sown in June and July for autumn and winter use. 1*s.* 2*d.* per lb., 7*s.* per gallon.

SUTTON & SONS, SEED GROWERS, READING.

NEW SCARLET VERBENA—"MRS. WOODROFFE."

ARTHUR HENDERSON AND Co. can now supply fine strong plants of this very fine new Scarlet Verbena, 4 to 6 inches high, with numerous side branches, and all well hardened, fit for immediate planting out, at the following reduced prices, viz.:—

1 Plant	... ...	1*s.* 6*d.*
12 Plants	... ...	12 0
25 Plants	... ...	22 0
50 Plants	... ...	40 0
100 Plants	... ...	70 0

Specimens of blooms can be sent per post in tin cases (on receipt of 6 Postage Stamps) to those who are desirous of seeing and judging for themselves of the merits of this splendid variety.

Pine Apple Place, Edgware Road, June 9.

BASS AND BROWN have published a Supplement to their Catalogues, with extracts and descriptions of a few new and select plants, which may be had free on application.

BEDDING PLANTS.—An extensive stock of the finest and most popular, strong and well established, at low prices.

GERANIUMS, GLOXINIAS, ACHIMENES, STOVE, GREENHOUSE, and HERBACEOUS PLANTS, in splendid collections, for which see advertisements in *Gardeners' Chronicle* of April 21 and 28, and May 5 and 12.

Seed and Horticultural Establishment, Sudbury, Suffolk.

NEW WHITE BEDDING CALCEOLARIA.

CHARLES TURNER begs to recommend this beautiful new plant for bedding purposes or for conservatory decoration; colour pure snowy white, dwarf habit, and an abundant bloomer. 7*s.* 6*d.* each.

C. T. can also supply good plants of the following NEW VERBENAS:—

WONDERFUL.—The finest and most attractive variety ever offered; rich plum-purple, with large white centre. Fine truss, and a superb variety for bedding. 5*s.* each. Also—

Blue Beard	Lord Raglan
Commander-in-Chief	Boule de Feu
Empress of France	Silistria
Florence Nightingale	Violacea
Tyrian Prince	Mrs. Woodroffe
Rose of England	Empress

and all the new continental varieties. Prices on application.

Royal Nursery, Slough.

WHEELER AND SON'S SHORT SELECT SEED LIST.—Our Priced List of Seeds for this season, containing Descriptions and Prices of the best GARDEN and FLOWER SEEDS, will be forwarded free by post. It is our earnest endeavour to send out all Seeds, whether for the Garden or Farm, of the very best quality and true to name; and as many of the Seeds are our own growing, and are proved before sending out, we generally succeed in giving entire satisfaction to our customers.

We are in daily receipt of most gratifying letters and renewed orders from those we had the honour of serving last year; and as we deliver our Seeds CARRIAGE FREE, we very respectfully solicit the honour of an order from those who have not yet given us a trial.—J. C. WHEELER & SON, Gloucester, Seedsmen to the Gloucestershire Agricultural Society.

NEW AND CHEAP PLANTS.

HENRY WALTON, FLORIST, &c., Edge End, Marsden, near Burnley, Lancashire, has now on hand a fine stock of the following, which may be had at the extremely low prices annexed:—Achimenes Carl Walforthi, 1*s.* 6*d.*; Cherita, 1*s.* 6*d.*; Louis Van Houtte, 1*s.*; Gigantea, 5*s.*; Madame Ransdatier, 3*s.*; Mr. Parparet, 1*s.*; Sir Traherne Thomas, 1*s.*; Henderson, 2*s.*; or the lot post free for 12*s.* Gloxinias, choice varieties, 1*s.* 6*d.* to 3*s.* 6*d.* each. Verbenas of this season, viz., Wonderful, Blue Beard, Lady Lacon, Commander-in-Chief, Empress of France Florence Nightingale, Rose of England, Tyrian Prince, Eva, Boule de Feu, Lord Raglan, Empress, Mrs. M'Neil, Violacea, Silistria, and Mrs. Woodroffe, 1*s.* 6*d.*, or 18*s.* per dozen post free. Clianthus magnifica, 2*s.* 6*d.* each. Begonia Prestoniensis, superb, 2*s.* 6*d.*; extra strong, 5*s.* Eugenia Ugni, 2*s.* 6*d.* Fine Show and Fancy Geraniums, 60*s.* per 100, or 50 for 32*s.* 6*d.* Scarlet and White, and older kinds of Geraniums, 3*s.* 6*d.*, 4*s.* 6*d.* and 6*s.* per dozen. Dahlias, strong plants, 3*s.* 6*d.* per dozen. Bedding Plants, of sorts, equally cheap. Descriptive List may be had for one stamp.

It is respectfully requested that orders be accompanied with Post Office Order payable at Marsden, Lancashire, unless reference is given.

NEW AND CHEAP FIRST-RATE SHOW AND BEDDING PLANTS.

THE CHEAPEST ESTABLISHMENT IN THE KINGDOM IS AT HENRY WALTON'S, FLORIST, &c., Edge End, Marsden, near Burnley, Lancashire, where there are propagated annually for sale from 20,000 to 30,000 plants, which, for cheapness and quality, are not to be equalled, being robust and healthy.

GERANIUMS.—Strong blooming plants, of varieties of 1853, such as Empress, Carlos, Neatness, Glow-worm, &c., 25*s.* per dozen; older show varieties, 9*s.*, 12*s.*, and 15*s.* per dozen; 25 for 30*s.*; 50 for 30*s.*, good plants.

FUCHSIAS, new varieties of last season, 6*s.* to 9*s.* per dozen.

CINERARIAS, choice varieties, such as Advancer, Etoile de Vaise, Empress, &c., 10*s.* 6*d.* per dozen; older varieties, good show kinds, 3*s.* 6*d.* per dozen.

PANSIES, 12 distinct fine show varieties, 6*s.*; 25 fine vars., 12*s.*

VERBENAS, new varieties of last season, 4*s.* to 6*s.* per dozen.

DAHLIAS, all the leading show kinds of last season, 9*s.* to 12*s.* per dozen; older varieties 4*s.* 6*d.* to 6*s.* per dozen, extra strong plants.

Bedding Plants, including Scarlet and other Geraniums, Salvias, Heliotropes, &c., equally cheap.

H. W.'s Spring List may be had for one penny stamp.

It is respectfully requested that all Orders be accompanied with a Post-office Order, payable at Marsden, Lancashire, unless a reference is given. Orders to the amount of 25*s.* paid to Liverpool, Manchester, Leeds, and Preston; 2*l.* and upwards free to Birmingham and Carlisle; and the like distance, or more distant, extra plants gratis.—Edge End, Marsden, June 9.

TURNIP SEEDS, ETC.

PETER LAWSON AND SON SEEDSMEN to the QUEEN and to the HIGHLAND AGRICULTURAL SOCIETY, beg leave to intimate that they are sending out the following TURNIP SEEDS, for which they respectfully solicit orders. They are all of the most approved kinds of last year's growth:—

The Gardeners' Chronicle.

SATURDAY, JUNE 9, 1855.

MEETINGS FOR THE ENSUING WEEK.

WEDNESDAY, June 13—Royal Botanic..... 2 P.M.

WE presume that the Directors of the CRYSTAL PALACE are satisfied with their experiment in flower-showing, for they collected a very great crowd of visitors last Saturday; there were objects in abundance to look at, and, to do the spectators justice, they appeared to marvel at the many things that were set before them.

Never did the Palace itself look to greater advantage; everything was clean and in its proper place; the painting was fresh, the gilding untarnished, the trees and shrubs belonging to the place full of health and vigour; the tanks were well filled with water plants, and while there was nothing to offend good taste, except the ethnological absurdities, the spectator encountered at every step something upon which the eye could rest with pleasure.

The gardens and terraces, green with the first burst of foliage, exhibited the ground to much advantage, and were the resort of thousands during the afternoon, for there was no cold air to chill, nor long hours of sunshine to oppress. Even the beautiful landscape, spreading away into indefinite distance, was less hazy than usual. The fountains were the admiration of all who saw them; but they played for so short a time that although they began only at half-past 4 those who arrived at 5 saw nothing of them. Let us hope that it is not the intention of the directors, after their enormous outlay upon hydraulic works, to limit their water display to a few minutes' sparkle.

The quantity of plants collected for exhibition from all quarters was prodigious, and for the most part creditable to the growers. It is said that the lines of specimens extended for more than a mile in length. We by no means answer for the accuracy of this calculation, but it does not strike us as improbable. Who contributed most successfully to the display will be seen in another column; who they were that failed in the contest it boots not to declare. Nor, indeed, is it possible, even were it desirable, to enter into details when so large a subject has to be commented on. Let us hope that our reporter has done substantial justice in the account published in another column.

After such a statement, the reader will be surprised to hear that, notwithstanding all this splendour, the exhibition was undoubtedly a great failure. We mean that it produced no such effect as a thousand guineas offered for prizes, and a prodigious quantity of plants might have been expected to secure. With the single exception of the line of Orchids, which was unequalled, all the rest disappointed us. No such banks of Roses and Indian Azaleas as were formed at the last Horticultural Society's exhibition could be found. Scattered here and there, broken into detached lines, and placed in extended order, that breadth of colour and form which is produced by skilfully grouped masses was lost. The eye had nothing to rest upon; in the language of artists there was neither keeping nor repose in the picture; the scene was one of scattered points; it would have reminded us of a multitude of precious gems thrown over a gaudy carpet, had not many of the plants been garden rubbish.

Another circumstance which must always spoil the effect of a horticultural exhibition in such a place as the Crystal Palace is the magnitude and splendour of the surrounding objects. The eye is irresistibly withdrawn from little plants in pots to the brilliant decorations of Alhambras and Mediæval Courts, and the gigantic forms that meet the observer wherever he goes. The eye cannot but compare one thing with another; and a plant which seems a noble specimen of cultivation beneath a tent, in a garden, where nothing equal to itself can be found, is lost among lofty columns and high over-arching roofs, covering lines of glittering palaces. The same bad effect upon plants was observed in the original building in Hyde Park, and is inseparable from all combinations of the gaudy and gigantic with the small and unpretending. We see it in another shape in even the usual garden exhibitions, where Tulips and Pansies, however beautiful in themselves, are lost in the neighbourhood of great bushes loaded with brilliant flowers.

If an exhibition is to be effective, every surrounding object must be subordinate to it. In the Crystal Palace it is impossible but that the exhibition should be subordinate to surrounding objects.

To fruit we have not yet adverted. When we saw that so large a sum as 250*l.* was offered for fruit on this occasion, we certainly thought that the power of English gardeners would be shown in a manner before unheard of. Judge then of our surprise when we found that for this 250*l.* there was nothing to show beyond a very shabbily arranged shelf in a back court, crowded with no very considerable quantity of specimens, one half of which ought to have been refused admission. Some excellent examples of growth were, doubtless, present, as there always is; and we presume that the prize list will indicate from whom they came; but as for the "ruck" the greatest favour that can be shown them is to be silent.

Two inferences of practical value may be drawn from this experiment, looked at in the only way in which it can possibly interest any body except the proprietors of the Crystal Palace, and the effect which such an affair may have upon their funds; firstly, that mere money will not bring forth excellence; and, secondly, that the really good gardeners, who are permitted to exhibit their productions, are far fewer than is supposed. To offer extravagant rewards for any branch of gardening is therefore sure to bring before the public demerit which would more advantageously remain in obscurity. Premiums upon want of skill operate like protecting duties, and repress the interests they are intended to promote.

GUERNSEY has long been famous for its LILIES; it now promises to become equally celebrated for its Ixias. We have before us a handful of the most charming flowers of that kind which it is possible to imagine, for which we are indebted to Mr. CARRÉ, a gentleman fond of gardening resident on the island. They are mules between *conica*, *longiflora*, we believe *scillaris*, and others, and look as if they had been gathered an hour ago at Cape Town, such is their vigour, such their perfect health. Some are white with a crimson eye, some wholly crimson; others are white and rose-coloured, golden yellow with crimson backs, pure yellow, or cream-coloured with a chocolate eye. Their fragrance is that of Roses. All are from the open ground, no shelter being required in Guernsey. Can we have them here?

Hitherto the cultivation of Ixias and similar Cape Bulbs has been a failure. The plants grow feebly, flower languidly, and perish. Now and then, at the foot of the front wall of a hothouse, where they find damp in the spring and dry heat in autumn, they maintain a wretched existence for a few years; but as ornaments they are valueless. And yet in their native plains they are among the most brilliant of the brilliant, springing up in myriads after rain has fallen, and drying up when the parching sun of Southern Africa again begins to tell. In Guernsey they behave in the same manner, and we entirely believe in Mr. CARRÉ's eulogium of these exquisite flowers as they appear with him.

And are we indeed so poor in invention, so resourceless, so barren in expedients that we cannot do artificially in London what is done naturally in

Guernsey? We who boast of victory over races as rebellious as Orchids, Heaths, and Roses in pots! Surely not. We have only to make the attempt, and success must follow.

Ixias may be had in any quantity of the dealers at Cape Town; so may species of *Babiana*, *Anomatheca*, *Sparaxis*, *Tritonia*, and *Gladiolus*. And nothing can better deserve a new trial. The last genus, indeed, sufficiently shows how willingly these southern plants lend themselves to domestication: how well and how gracefully they wear their chains. The Ghent Gladioli are the glory of our autumn;—why should not the Ixias be the gems of our spring?

What is wanted in managing them is rapid growth when growing, dryness and high temperature when ripening, absence of frost, and plenty of fresh air. It is the neglect of these conditions that has led to failures. When bursting into leaf they are chilled and checked; as they slowly advance in the face of such an obstacle they are cooped up in suffocated greenhouses, or put upon a shelf near the glass, to be killed before they are half grown. As to air, that is never thought of; or if they chance to stand for an hour or two, in a dried-up porous pot, in the dry draught from an open sash, they are expected to repay our barbarous treatment with smiles instead of a shudder. Give them warmth and moisture when growing, plenty of room for their roots, and an incessant renewal of air; give them when ripening more heat, more light, more air, and less moisture, till at last they sink to repose in absolute dryness, and we shall treat these graceful strangers as nature treats them at home.

What gives Guernsey an immense advantage over England is, that in that favoured spot gardeners can do in the open air what can here be effected only under glass. Frost is little known; and greenhouse plants are hardy there. Mr. Carré gives us the following list of plants that passed the last severe winter without protection of any sort:—Abelia uniflora; Abutilon striatum and venosum; Acacia dolabriformis (in bloom June 3), A. armata, A. verticillata, and tenella (against wall); Araucaria excelsa and Braziliensis; Azalea indica—many varieties (in bloom from May 18); Aster argophyllus; Begonia Evansiana; Bletia hyacinthina; Benthamia fragifera; Cactus hyb. between Eyresii and oxygonus; Camellias (bloomed superbly during the dry cold winds); Chamærops humilis (showing bloom); Cheirostemon platanifolium (only young wood injured); Citrus decumana (against wall); Chorozema varium; Clianthus puniceus (against wall); Dacrydium Mayi and Franklini; Deutzia gracilis; Diosma uniflora (in full bloom June 1); Epacris paludosa; Erica cruenta, cerinthoides, and intermedia (scarcely protected); Erythrina crista galli (10 feet high); Gnidia simplex; Grevillea sulphurea; Habrothamnus fasciculatus and elegans; Kennedya inophylla; Melia sempervirens; Mitraria coccinea; Pinus filifolia; Polygala Dalmaisiana (injured where exposed to the wind) and angustifolia (against wall); Primula sinensis (in full bloom May 15), Rhododendron arbor. roseum (bloomed in perfection in February).

In such an island almost anything may grow without assistance;—and so may almost anything in such a climate as ours with the aid of protection assisted by skill.

There is now to be seen in the Museum of Œconomic Geology in Jermyn Street a part of the trunk of a Willow tree lately felled in Battersea Fields, in the centre of which was found an aerolite, or meteoric stone, of very large size, which seems to have fallen on the tree many years ago and to have embedded itself in its substance. It is a prodigious curiosity, and well worth examination.

NEW GARDEN FERNS.—No. I.

[Now that Ferns are becoming so very popular, and cultivators of ornamental plants are learning to appreciate the decorative capabilities, in many instances exhibited by their graceful foliage—capabilities which by contrast serve to enhance the beauties of those plants which bear gorgeous flowers, it has been thought that a brief notice of the recent additions to garden Ferns may be useful to those who are forming collections of the choicer of these plants. It is proposed, therefore, under the above head to notice from time to time some of the most interesting of the additions made to our collections within the last few years. The importers of novelties of this class are invited to aid the writer in carrying out this object. *Thos. Moore, Botanic Garden, Chelsea.*]

1. Nephrolepis davallioides, T. M. (Aspidium davallioides, *Swartz, Syn. Fil.* 48 and 247; *Hooker, Ic. Plant.* t. 395-6).

Fronds pinnate, glabrous; pinnæ sessile, the lower barren, lanceolate acuminate, obtusely serrate, the upper fertile, narrower, and much elongated, deeply crenato-lobate, the lobes rounded and bearing at the apex a single sorus; rachis clothed with small narrow scales.

This is a very handsome evergreen stove Fern, producing gracefully pendent fronds, upwards of 3 feet in length, and 8—10 inches in breadth, the pinnæ rather distant, horizontal, the lower ones broad, the upper narrower, longer, and very evenly and conspicuously lobed, the lobes narrow, rounded at the apex, and there bearing each a single sorus, the reniform indusium of which is placed just within the margin of the lobe. A somewhat similar structure occurs in the Dicksonia abrupta,

Bory, a plant separated by Presl as a new genus under the name of Leptopleuria, but the fructification of Bory's plant is in reality that of Dicksonia, having the two-valved indusium proper to that genus; whilst in the present plant, which is associated by some pteridologists with that of Bory, the margin of the lobe is unaltered, and the indusium is truly that of Nephrolepis. It agrees with Nephrolepis, too, in the development of a peculiar wiry stoloniferous scaly rhizome, to which the fronds are adherent in fascicles. This very elegant plant was introduced from Java by Messrs. Rollisson in 1852.

2. Platyloma Brownii, J. Smith. Hook. Journ. Bot., iv. 160 (Adiantum paradoxum, *R. Brown, Prod. Nov. Holl.*; Allosorus paradoxus, *Kunze*; Pteris latizona, *A. Cunningham, MS., in Herb*).

Fronds ovate pinnate; pinnæ few, oblong-ovate, or lanceolate, falcate, stalked, rounded or subcordate at the base; veins not apparent; sori broad, linear, marginal; indusium narrow, herbaceous; rachis and pedicels puberulous, and as well as the long stipes ebony coloured, and bearing a few narrow scales.

This fine and rare greenhouse Fern is most nearly allied to Platyloma falcatum, but it differs essentially from that species in its long stipes and short broad fronds, in the different form of the pinnæ, and their fewness (7-12), and in the nature of the scales which clothe

the stipes and rachis. It is a handsome species, growing about 2 feet high, the fronds being lateral, and adherent to a creeping rhizome. The cultivated plant, which was introduced in 1853 by Messrs. Henderson, of the Pine-apple Nursery, is reported to have been received from New Zealand. It had been hitherto only known as a native of New Holland.

3. Polypodium (Arthropteris) filipes, *T. M.*

Fronds simple, elliptic-lanceolate, or oblong-ovate; or pinnate, with about 1-3 pairs of small oblong obtuse pinnæ, and a terminal lanceolate-acuminate one several times larger; sori submarginal; rachis and stipes downy; rhizome filiform, clothed with spreading fuscous lance-shaped scales.

This curious little plant, which has the appearance of a creeping Ficus, was imported along with Platyloma Brownii by Messrs. Henderson, of the Pine-apple Nursery. Its fronds, which are articulated with the creeping rhizome, are from 2 to 4 inches high, sometimes elliptic-lance-shaped and quite entire, or oblong-ovate with a small lobe or two at the base, or distinctly pinnate, with one, two, or three pairs of small obtuse pinnæ, and a terminal lanceolate-acuminate one many times larger, obscurely crenate, and slightly hairy on the veins beneath. The rachis and stipes are clothed with short curved hairs; the rhizome is very slender, and covered with lance-shaped tawny scales. The veins are once or twice forked, and terminate within the margin in club-shaped heads. The plant has fruited sparingly during the past summer in the garden of the Royal Botanic Society, and proves to be a Polypodium of the Arthropteris group, abundantly differing in its slender rhizome and dwarf habit from the other member of this section of the genus.

VEGETABLE PATHOLOGY.—No. LXXV.

322. Præcocitas (*Forwardness*).—Amongst a large number of seedlings, plants are found endowed with various qualities, without our being in the least degree able to assign the causes from which such differences arise. These qualities may either be good or bad, according as they answer the purposes of the cultivator, and they may be considered as real maladies, according to the influence they have in promoting or obstructing the main ends of vegetation. The condition before us may have great influence on the produce of the plant, but can scarcely be called a malady. In many cases it is a quality highly beneficial to the cultivator, because it enables him to extend the period through which he can supply a certain fruit or vegetable. He depends, for instance, on particular varieties of Peas, Potatoes, Apples, Pears, Plums, &c., for early produce, and one of his main efforts in producing new varieties is to produce such as will enable him to meet the demands of the market a few days earlier than he has hitherto had it in his power to do. In some cases, however, demand will be made upon his skill to ward off the evil effects of a depressed temperature upon such early varieties, and as precocity in budding or flowering is not necessarily accompanied by proportioned speed in maturing the crop, however good may be the qualities of the produce, in a cold climate like our own, subject to late frosts and other external causes which prevent impregnation, one of the worst qualities that such a variety can have is a tendency to expand its blossoms and foliage too early. A skilful cultivator will pay attention, therefore, to this point amongst others in the choice of the varieties which he cultivates. All will depend upon the object he has in view. An early variety of Rhubarb, for instance, may afford him a crop at least a month sooner than others, and such a variety will be extremely valuable, while a fruit tree which has a disposition to flower early may be ineligible because of its liability to suffer from the usual inclemency of spring.

323. This precocity is not confined to cultivated plants, but instances occur very frequently amongst forest trees, where nature has been left to take her own course without any interference. The Horse Chestnut in the garden of the Tuilleries, which outstrips all its companions, has been noticed by many authors, and I have myself had an opportunity of observing its peculiar forwardness. This, however, is scarcely a case in point, as the trees have all been brought to the spot, but the same thing occurs in natural forests. A particular Oak standing on the border of a wood in the parish of Cotterstock, Northamptonshire, and conspicuous to everybody who travels through the district, has been noticed for many years in consequence of its peculiar forwardness. The present season has given an excellent opportunity of observing its unvarying precocity.* A month ago when the buds of other Oaks were almost as dormant as in the midst of winter, this tree stood out from the rest, covered with luxuriant foliage; and it is by no means a solitary example.

324. This constitutional precocity, it should be observed, is entirely distinct from that tendency which plants possess to retain old habits when transplanted into a new locality. This is a circumstance which makes many objects so difficult of cultivation, because they do not accommodate themselves to new circumstances. The process of acclimatisation is very slow if it takes place at all, and in general it is attained only by the production of new varieties with new habits. Plants like Forsythia viridissima, or Calycanthus præcox, can scarcely be expected to become plants, even of the latter part of spring, and can only become general objects of cultivation where they are themselves regardless as to temperature, or where there is peculiar protection from climate or locality. *M. J. B.*

MISTLETOE OF THE OAK.

Professor Schleiden, in a note in his "Studies," says, "The Mistletoe of the south of Europe, or the Viscum of the ancients, is undoubtedly the same plant as that which grows principally on Quercus cerris, and which Linnæus named Loranthus Europæus. This plant, however, is not met with north of the Alps, or in the West of Europe. The only plant like it which grows in these parts is the common Mistletoe, Viscum album L., from the leaves, bark, and berries of which birdlime is obtained. Nearly all botanists agree that Viscum album L. is never found growing on Oaks, whilst we know from the mythology of the Celtic and German nations that the Oak-mistletoe was the one and the only one regarded with veneration. This creates a difficulty by no means easy to solve. An Englishman of the name of Beaton states that he once found the common Mistletoe on an Oak in the neighbourhood of Ledbury, and that he succeeded in making it grow on Oaks. It is possible that the veneration with which the

* For nearly 50 years this tree has been the resort of school-boys in late seasons to procure a supply of Oak leaves for the 29th of May, to my own knowledge, and I have no doubt it has furnished its contribution during the present backward season.

Oak-mistletoe was regarded was connected with its great rarity."

In the latest Flora of Vienna we find with respect to Loranthus Europæaus the following observations :—"On Oaks, especially on Q. pedunculata and Q. sessiliflora, scarce. In the Oak forests of Schönbrunn, on the Gallicin, at the back of New Waldeck here and there, much more common on the Bisamberg, and in the woods of Schwadorf and Prankenwerth." In the appendix to the same Flora it is stated to be "common on the Oaks in the Laxenburg Park, on the Laithagebirge, and on the Hochleiten." In the flora of Niähren the Loranthus is said to occur "in woods and pastures on Oaks, wild Apple and Pear trees, near Muschau, on the mountains of Polau, and near Blansko." Garcke says it is found "near Teplitz." Viscum album is also found on Oaks, according to Hausmann ("Flora of the Tyrol"), Gaudin ("Flora of Switzerland"), and Borckhausen (Holzgew, &c.) *Linnœa, May* 4.

CLIMATE OF FOREIGN COUNTRIES.

No. IX.

Having now returned from Nice I can give some few particulars as to the state of vegetation at various places on the journey homewards. I left on the 1st of May, and at that time the white Acacias were in full flower, though here (Chelmsford) they are not yet in leaf. The white Scotch Roses, Pittosporum, and Habrothamnus, were also in blossom in the open air. Just before I came away I saw a woman with a large tray of Alpine Strawberries for sale in the streets. They were also, I found at Marseilles, sold in the market there in earthen jars ; a striking difference was soon observable in the appearance of the vineyards after leaving Italy. There the Vineshoots were more than a foot long ; but before reaching Marseilles they were hardly visible. The Banksian Roses, were, however, very beautiful there.

In the southern parts of France the Olive trees seem to have severely suffered from the late winter, and for about the breadth of a mile before their cultivation ceases they were killed and quite brown.

At Grenoble, which is surrounded by splendid ranges of mountains covered with snow, on the 5th May the Lilacs were in fine bloom on the Bastion Hill, and a large plant of Wistaria sinensis in the Jardin des Plantes, also Spiræa prunifolia, and Magnolia purpurea ; as these are now only just in flower here, it would seem that Grenoble is about a month forwarder than this part of England. Here I first recognised Gooseberry trees, which had not been seen in Italy. In Switzerland, between Lausanne and Fribourg, there are Gooseberry hedges by the road-side. The Judas trees, which grow wild in the vicinity of Grenoble, looked very gay.

On crossing over the high hills on the south side of Geneva, May 8th, the blossom of the Apple and Pear trees, which had continued from Nice, gradually disappeared, as it is there very cold, and there was scarcely any foliage on the trees, whilst around the city, which is lower and warmer, spring was again in full beauty. In the Botanic Garden the various greenhouse plants were being placed on stages out of doors, and the large collection of Pæonies, &c., was in full blossom. In the meadows, near the junction of the Rhone and the Arve, Narcissus poeticus was found wild, and a brown-looking Cotoneaster. Lilies of the Valley were also in blossom, and likewise at Berne. These show that vegetation in the valleys of Switzerland was about three weeks before that of England.

In the level country, on the German side of Basle, Cherries and Walnuts are extensively grown, considerable quantities of oil being made in Switzerland from the latter. It was stated that these had sustained much injury from recent frosts.

At Mannheim, on the Rhine, the Horse Chesnuts were in flower on the 14th May, whilst here they are hardly yet out.

Annexed is a statement of the Temperature at the various places passed through in the Morning and Evening, taken by the same Thermometer.

E. C.

Home Correspondence.

Spring Protection for Wall Fruits.—I was actually going to refer your readers to the volume for 1854, p. 389, when, on opening my *Chronicle* by this morning's post, I perceived that you had reproduced the sketch of Dr. Lisle's pantile coping for fruit walls Surely when a correspondent, who must now be 90 years of age, bequeaths to the world the experience gained by him at the close of a long life, of the advantage of some protection (to Apricot trees especially), your readers are not likely to be led away by the discoverers who insinuate that such protection is all wrong, and who have got, *mirabile dictu*, an accidental crop without even a coping. I have a curious corroboration to give you of the value of your editorial article in April last, which explained by diagram the laws of radiation. An amateur near me (the most successful gardener whom I know) told me that for 35 years he has never "lost a crop." Now, it so happens that he has precisely carried out your conditions, though perhaps without being aware of his acting so philosophically. His protection is old net, two or three-fold, placed against the trees at so acute an angle as to prevent excessive radiation from below, and to intercept all rime from above. He does not use a nail, and his nets, once hung, are not removed till the fruit is of some size. Long Hazel rods are stuck in the ground, and just bent or pinched in under the coping ; a thinner rod is tied to these parallel to and immediately under the coping ; the nets are tied with bast to this horizontal rod and to the upright poles ; each tree has its separate netting, so that in every case there is very free access of air at each side and at the bottom, for the nets do not reach the ground by about two feet. I remember reading in old Forsyth that nets three-fold will keep out any ordinary English frost. I have tried my friend's plan in the last two years, and found it perfectly successful ; and I may say I have Apricots "where I never had them before." Let it not be supposed that the continuous success of an individual for 35 years is owing to some favoured locality ; he has lived during that time in various places. I can state that in his present residence he has made a productive garden out of a bare unpromising field, on high ground, with no natural shelter. And now a word to your correspondents of May 21st and 28th. May we not from the success of this airy covering, and of Dr. Lisle's pantile roof, unriddle what to them is so mysterious, and suspect them very gently of "coddling" their trees ? I infer from what one says so carefully of his canvas, and another that even "double mats" did not keep out spring frosts, that open netting placed steep enough before the trees, and left there day and night, would have procured a crop in 1853, and many previous years. I have heard that in villages on the Wiltshire Downs wall trees are safe under a projection of a foot of thatch ; this would corroborate Dr. Lisle's idea ; acting upon it, I last year placed deal planks as an additional coping of about a foot over two trees, and with great success. One, an old Greengage tree (after having its decayed trunk almost cut through and "collodionised"), bore me a crop for the first time since I have lived here, 19 years, and this year it is again covered with healthy fruit. *G. W., Bradford, Wilts.*—— I am induced to bear testimony to the utility of Dr. Lisle's plan of protecting wall trees, having ripened an immense number of Peaches and Nectarines under a very similar covering. I have 300 feet protected in the manner he recommends. The walls, which are 2 feet thick and 12 feet in height, are built of rag or refuse from a slate quarry, faced with bricks. The canopy or bonnet (as I term it) is 4 feet 6 inches in width, and projects 2 feet on the south side, and 6 inches on the north, in order to carry the drip well off. The brackets or supports are 9 feet apart, 4 feet long, and secured by a bolt to the covering, and a long nail to the wall ; the wall plate on the north-side is fixed by means of clamps, 15 inches long and 15 feet apart. On the under side of the projecting edge of the canopy there are small hooks, 15 inches from each other, for the purpose of hanging a net on, which is of twine, inch-mesh, 4 yards wide. It is put up in the latter end of March and taken down as soon as the weather will permit. Being suspended 2 feet from the wall, it does not afford sufficient warmth to encourage insects or weaken the young shoots, and, at the same time, plenty of room is left for working under it, such as disbudding, nailing in, or thinning fruit, all of which are immediately attended to when required, every lateral that may be considered unnecessary for future purposes being removed by the thumb nail, leaving as little as possible for the knife. In my opinion the ripening of the young wood is the principal object to be attained ; that done successfully, a crop will naturally follow. I would likewise mention the treatment my border receives, as gardeners appear to differ respecting the disturbing of roots ; it is about 10 feet wide, and the 3 feet nearest the wall are kept at rest, and constantly covered with saw-dust. The remainder is manured and cropped with small vegetables. Under this management we have an abundant crop every year, and although we have had the past winter and spring very severe, the whole of the trees are covered with fruit, not hung in bunches, here and there, at the points, but distributed all over equally, and the trees are looking clean and healthy, without insect or curled leaf. The soil is what is called rag. The varieties grown are the Noblesse, Royal Kensington, Royal George, Chancellor, Admirable, Barrington, &c., Peaches and white Nectarines. They are mostly trained on the fan system. *Henry Bellew, Oakhampton House, Somerset, June* 5.

Mineral Coal Tar.—I received for many years from Messrs. Cassell, Mill Wall, Poplar, the above tar in casks of from 360 to 410 lbs., containing about 30 gallons, and costing about 12*s.*, but since the destruction of their manufactory by fire some years since, I can learn nothing of Messrs. Cassell. Can any one inform me where such tar is to be had ? Its great merits are that it is laid on well in temperate weather without any heating, and retains a good black colour. *L.*

Nursery Names of Plants.—Having often suffered annoyance by purchasing the same plant under different names, I venture to ask for your powerful assistance in putting an end to so great an evil. I therefore call your attention to a case at the Crystal Palace on Saturday last. Three different nurserymen exhibited the same plant under three different names. The plant was a Maranta, evidently only a fine variety of M. roseo-lineata. I have found on inquiry that it was introduced from Lima by the Royal Garden at Kew, and thence liberally distributed to different nurserymen. 1. It was exhibited by Messrs. Jackson, of Kingston, as Maranta, species from Java ! ! 2. It was exposed by Messrs. Rollisson, of Tooting, under the grand name of M. regalis. 3. It was exhibited by Messrs. Veitch and Son as M. roseo-lineata, variety elegans of Kew Gardens. Now any person not seeing the plants would easily consider them to be three distinct kinds, and buy perhaps one of each. It is too much the habit of some men to give grand names to mere varieties, treating them as species. But my opinion is that while we have botanists in England such as Sir William Hooker and Dr. Lindley, willing at all times to determine the names of new introductions, there is no excuse for furnishing plants with names which only lead to annoyance and confusion. The object is evidently to catch the eye or ear and so the pocket of unwary purchasers, among whom is to be included *One who has Suffered.*

Grape Growing.—I have been waiting 12 long years for Grapes, and had only two bunches about three years back. My gardener promised me Grapes this year for certain, but alas ! there is not a single bunch. There are shoots from 3 to 4 feet long, and plenty of wood but rather weak : the roots are good—I have had them brought to the surface three times. My gardener proposes turning the Vines out until this time next year. Do you approve of this ? *M. K.* [Discharge your gardener.]

Fern Judging at the Crystal Palace Show.—There are several of our British Ferns that are not hardy. Among these I will confine my attention, for reasons to be mentioned presently, to Adiantum Capillus Veneris, Asplenium marinum, and Trichomanes radicans ; neither of these will bear the brunt of exposure to the climate of London at any rate, nor have I either heard or read of their being found or planted in such situations as would entitle them to the designation of hardy plants. Mr. Moore, speaking of the first named ("Handbook of Ferns," p. 198), says :—"Adiantum Capillus Veneris.—This Fern does not bear exposure, but flourishes in a confined damp atmosphere, attaining its greatest luxuriance when supplied with a moderate degree of warmth." Mr. Williams, speaking of the same plant ("Hints on the Cultivation of British and Exotic Ferns," p. 36), says :—"A rare species, found growing in moist caves and on damp rocks by the side of the sea. It is rather tender, and should be planted in a sheltered part of the fernery, similar to the stations in which it is found wild." And Mr. Newman ("History of British Ferns," p. 7) says :—"It grows freely in a greenhouse, without any artificial heat beyond that which the protection of the glass supplies ; it should never be exposed to the rays of the sun." Of Asplenium marinum, Mr. Moore writes (p. 161) :—"No one, as far as we are aware, has been successful in cultivating the Sea Spleenwort in the open air in the climate of London, exposed unsheltered to which it perishes." Mr. Williams says (p. 33) :—"This is a tender species, requiring to be planted in a sheltered part, as, for instance, in a cave." Mr. Newman says (p. 241) :—"This is a most difficult Fern to deal with in cultivation, unless carefully protected from exposure ;" and page 242, "I find this plant invariably killed by severe frost ; I lost every plant in the frost of January 1854." And of Trichomanes speciosum, Mr. Moore writes (p. 202), "This Fern requires a damp calm atmosphere, without which it will not thrive, hence all attempts to cultivate it artificially, other than under close confinement, have failed." Mr. Williams (p. 37), "This is a tender evergreen species." And Mr. Newman (p. 294), "The main object to be achieved in the cultivation of this beautiful Fern is an atmosphere loaded with moisture. In the drier counties of England this can only be maintained by a constant covering of glass." The experience of every cultivator of Ferns fully bears out the statements of the above writers, so that the fact, that the above-named plants will not bear exposure to our climate, may be said to be fully established. These remarks have been provoked by the erroneous decisions of the judges of the Ferns at the Crystal Palace on Saturday last. First, second, and third prizes were awarded to collections containing each of them the above-named plants, while a fourth collection containing none but the most hardy kinds was entirely passed over, for you will recollect that in the schedule of the Company collections of hardy (not British) Ferns were invited. Now in order that you may be assured of the perfect hardiness of the plants in the overlooked collection, I will insert the names of those of which it was composed. Athyrium filix-fœmina, Lastræa dilatata, L. filix-mas, L. spinulosa, L. Thelypteris, L. rigida, Polypodium dryopteris, Asplenium Ruta-muraria, Ceterach officinarum, Polystichium aculeatum, Blechnum spicant, Allosorus crispus, Scolopendrium vulgare, var. crispum, with the seven following North American species :—Asplenium Thelypterioides, Aspidium acrostichoides, Osmunda cinnamomea, O. interrupta, Onoclea sensibilis, Lastræa intermedia, and Struthiopteris pennsylvanica. Possibly the judges were unacquainted with the North American species, or might have thought, because they were foreign, they must necessarily be tender. *William Chitty, Stamford Hill.*

Ants (see p. 376).—It may be useful to "A. L." to know that a small quantity of arsenic mixed about the thickness of paint, and put into a saucer with a little sugar and water or milk, will soon destroy his troublesome companions. I have stuffed rags in their holes, and soon had others made in the place of them. *Constant Reader.*

Vinegar Plant.—The following is an excellent receipt for making vinegar from this plant. To five pints of water add half a pound of treacle, heat to boiling, and then pour it on half a pound of coarse brown sugar, let it cool until about milk warm, and then put the plant into it, and set it in a moderately warm place; a cupboard in a recess by the kitchen fire is the best situation for it. A young piece taken from the mother plant should be used as soon as possible, but it may be kept an hour without injury. *J. R. M., The Cottage, Duxford.*

Bedding Plants and Bottom heat.—I quite agree with Mr. Ayres' plan of keeping flower-beds systematically turned or forked-up during seasonably warm weather, not only as a means of obtaining a considerable amount of bottom heat, but also as affording an opportunity of breaking up and exposing the soil to those atmospheric influences which are now so well known to be essential to the healthy development of plants. The plan of nursing young plants in prepared beds so early as April speaks for itself. A moderate quantity of heating material should be placed below the compost which is intended to adhere to the roots on taking up. This will encourage quicker growth. For I do hold that the larger we can get young plants for bedding out, so as to cover or nearly so the beds at once, the better. On coming to England some six years ago I was surprised to see so generally adopted the system of bedding out small plants, which in some cases took all the season to fill the beds. This seemed so much at variance with all my installed and preconceived ideas of bedding, that I could scarcely comprehend the reason of it till I discovered that no desire existed to have the plants so small but that there was no accommodation to grow them larger. Necessity is said to be the mother of invention, and probably this is the reason why people in cold climates are made more alive to their wants than those of more favourable climes. One thing I know is that until of late years I never saw small plants bedded out, but plants that filled the beds at once, and such as required it were pegged down in their place. Of the various modes, therefore, of getting bedding plants prepared for the parterre, that best fitted for the purpose well deserves our attention. *Peter M'Phail, Hammersmith.*

Hybrid Rhododendrons.—On the 8th of last month I sent you three flowers of hybrid Rhododendrons, the earliest then in bloom. I now send you 12 heads of flowers from as many different plants, to show their varieties of form and colour. Among them are umbels from the same plants from which the former flowers were gathered, and which are still in bloom. Some of these plants have had from 60 to 80 heads expanded upon them at one time. I send also a small and somewhat damaged branch to show the freedom with which they flower, and have selected for this purpose a branch whose flowers are not yet expanded. I would have sent many similar branches, the flowers of which were fully blown, but they would occupy too much room in the basket. The duration of the individual umbels is very remarkable; some have lasted in flower fully 10 days, whilst a succession of bloom keeps the plants in beauty for at least a month, during which time the splendour of their appearance can hardly be surpassed. The flowers are unquestionably more lasting than those of the American varieties, perhaps because they bloom at a cooler season. These plants have not received the slightest protection, either recently or during the winter. *J. R.* [These flowers were intended to have been shown at the Horticultural Society's meeting last Tuesday, but they arrived too late for that purpose. All of them were brilliant crimson kinds, and extremely handsome.]

Societies.

Horticultural, *June* 5.—The Rev. W. B. L. Hawkins in the chair. Mrs. J. H. Vivian, J. Stewart, Esq., W. E. D. Cumming, Esq., J. L. Ricardo, Esq., M.P., J. D. Cooper, Esq., G. Field, Esq., and Mr. J. Young, Elm Cottage, Taunton, were elected Fellows. There was again an excellent exhibition on this occasion. Of rare plants, Messrs. Veitch showed the golden Rhododendron Brookeanum, and R. californicum, mentioned in another column; also R. purpureum splendens, a purplish lilac kind, very much spotted in the upper petals; a large purple Moutan, and a branch of Embothrium coccineum. Messrs. Rollisson had the beautiful Indian shrub Meyenia erecta, alluded to in the report of the Crystal Palace Show. Of cut Rhododendrons there were several exhibitions. Mr. Ingram, gr. to J. J. Blandy, Esq., sent a boxfull, among which were Blandyanum, one of the best of the high-coloured kinds, Towardi, Ignescens, Elegans, Eminent, Captivation, Everestianum, &c.; and Messrs. Moore and Son, of Birmingham, also had a collection of 24 trusses, all numbered, but not named. J. Allnutt, Esq., of Clapham, showed Rhododendrons, both cut and in pots; but both were disqualified, owing to non-compliance with the regulations. Mr. Gaines sent a white and two pink and yellow coloured Ghent Azaleas. Pelargoniums, both fancy and other kinds, came from Messrs. Fraser, Dobson, Gaines, and Baron Goldsmid's gardener, Bray. All of them were well-flowered; but those from Messrs. Fraser were better covered with foliage and more perfectly grown than the others. Mr. Gaines also had examples of scarlet Unique, a useful variety for bedding purposes. Of Orchids six of the beautiful plants shown by Messrs. Veitch, at Sydenham, were reproduced here, and the same remark applies to the group from Messrs. Rollisson. The flowers on both these collections were perfect, and even as fresh and beautiful as if they had only newly expanded. Not a bruise could be seen on any of them, a remarkable fact considering the moving and travelling about to which they have been subjected. Messrs. Henderson, of Pine-apple Place, had a collection of stove and greenhouse plants, among which was a good specimen of Medinilla magnifica, and along with them Isolepis gracilis, an interesting little plant found on rushy moors in Germany, and extremely useful for hanging up in baskets, over the sides of which the foliage falls like masses of green hair. This plant was stated to stand smoke and dust better than most others; it may therefore prove suitable for windows. Mr. Ingram, gr. to her Majesty at Frogmore, sent cut specimens of Paulovnia imperialis literally loaded with blue Gloxinia-like flowers. They were stated to have been taken from a tree about 15 feet high, growing near the Terrace at Windsor. It had had no protection whatever; on the contrary it must have been much exposed, and yet its flowers wrapt up all last winter in their woolly envelopes have come out perfectly unscathed. To the dry warm autumn of last year and to the vigour of youth in the tree having settled down into more moderate growth, may, doubtless, be attributed its blossoming so finely this season. Now, however, that a flowering habit has been induced it will probably keep it, and certainly a tree in the condition in which the one in question is must be extremely handsome. Some small Tea, Noisette, and Hybrid Perpetual Roses grown in pots were shown by Mr. Wilkinson, of Ealing, in order to prove how well suited the Celine stock is for Roses cultivated in this way. Mr. Glendinning showed a seedling Heath, a dwarf and doubtless very useful kind. It had been raised between E. depressa and E. hybrida. Messrs. Veitch had a small plant of Lilium giganteum. Messrs. Rollisson produced one of the finest specimens of Erica ventricosa magnifica perhaps ever seen. It was literally a ball of flowers and healthy foliage nearly 4 feet in diameter. The same firm had also a potfull of the New Holland Pitcher plant mentioned in another column.

Among Fruits there were some good things. Mr. Dodds, gr. to Col. Baker, had a smooth-leaved Cayenne Pine, weighing 4 lbs. 5 oz; Mr. Davis, gr. to J. Dixon, Esq., a Jamaica Pine, weighing 3 lbs. 2 oz.; and Mr. Barron, gr. to Mrs. Vivian, of Singleton, a Queen, weighing 4 lbs. 9 oz. Mr. Tillyard, gr. to the Right Hon. the Speaker, exhibited three bunches of Black Hamburgh Grapes, well swelled and finely coloured. Murray Nectarines, and a dish of very fine May Duke Cherries came from Mr. Fleming, gr. to the Duke of Sutherland, at Trentham. Messrs. Toyne & Son, of Hounslow, had two pots of Cutbush's Prince of Wales Raspberry bearing fruit pretty freely. They appeared to have been last year's canes potted in autumn, and were very well done. Of British Queen Strawberries Mr. Dunsford had some very fine fruit, well coloured to the very points. This variety and also Myatt's Eleanor, famous specimens, came from Mr. M'Ewen, gr. to the Duke of Norfolk; but as only 30 of each sort were sent, instead of 50, the number required by the schedule, they were disqualified. The same grower had also a dish of Hautbois, which is still a favourite Strawberry with many. Mr. Allnutt showed Keens' Seedling, as did also Mr. Ingram, gr. to J. J. Blandy, Esq., and Mr. Chesher, gr. to S. Ware, Esq. Mr. Pestridge, gr. to E. H. Heyward, Esq., sent examples of Elton Strawberries. Of Melons the best, a green-fleshed variety, came from Mr. Boreham, gr. to Sir Fitzroy Kelly; it was incorrectly named Ispahan. Mr. Frost, gr. to E. L. Betts, Esq., had what was called the Preston Hall, hybrid green fleshed, apparently a good Melon. Finally, Mr. Ferguson, of Stowe, sent some 6000 green Peaches and Nectarines, the thinnings of trees that had never borne fruit till they were covered with glass, and now the crops they are producing were stated to be immense. So much for glass protections.

From Arundel Mr. McEwen showed 50 heads of Asparagus about 7 ins. in length, which weighed 2¼ lbs.

Of Miscellaneous subjects, Mr. Glendinning produced the Chinese garden pot, of which a representation was given the week before last, at p. 357. Mr. Kestell, of Burnham, Bucks, showed specimens of his labels, which have proved so useful at Frogmore, Dropmore, and other places about that quarter. They are made of iron with sunk faces, on which the names are written or printed; after some patent preparation glass is then put on, leaving no vacancy between it and the letters, and the whole is thus hermetically sealed. They are warranted by the patentees to stand all extremes of heat, cold, and moisture, and are manufactured in different forms and sizes to suit the different purposes to which they may be applied. They are uncommonly nice, and as regards prices were said to vary from 2*d.* to 1*s.* 6*d.* each.

From the garden of the Society came Viburnum macrocephalum and plicatum, the double yellow Datura, a singular looking herbaceous plant, and some other things, together with flowers of Mr. Fortune's Moutans, and of the white Glycine. The same establishment likewise furnished three pots each of four varieties of Strawberries, which have been treated exactly alike, with the view of ascertaining whether or not there would be any difference in their period of ripening. The sorts were Keens' Seedling, Ingram's Prince of Wales, Alice Maud, and British Queen. The result is that the three first had ripe fruit on them, ripe in the order in which they are mentioned, while the last had not begun to colour.

The list of medals, &c., awarded on the occasion will be found in our advertising columns.

Horticultural Show at the Crystal Palace, Sydenham, *June* 2.—How far the interior of this wonderful building is suited to the exhibition of plants will be explained in a leading article. Portions of what were shown there were accommodated in the nave, up the centre of the east end of which ran a double bank 281 feet in length and three stages deep, and in the west end was a similar stage full 156 feet in length. The rest of the exhibition was arranged in the tropical end of the building and in the open corridors facing the terrace gardens and park. Over the whole awnings were fixed, a few feet above the plants, serving to screen them from the sun. When we state that there were banks of Orchids 240 feet in length, Ferns and Lycopods 40 feet, Stove and Greenhouse plants 690 feet, plants remarkable for fine foliage 92 feet, Cape Heaths 200 feet, Azaleas 100 feet, Pelargoniums 180 feet, Calceolarias 66 feet, Fuchsias 40 feet, and "odds and ends" 72 feet, some idea of the magnitude of the show may be conceived. Its different parts were, however, so much scattered about that the general effect produced by so many plants was less striking than might have been anticipated.

The Azaleas, with the exception of a magnificent collection from Sir E. Antrobus's gardener, Mr. Green, were decidedly past their best, and some of them were even miserable specimens of cultivation. In this respect, indeed, the whole exhibition formed a striking contrast with that at Gore House, whose great distinguishing characteristic was that there was not a bad plant to be found, while here in nearly every class, to say the least of it, instances of indifferent cultivation might have been pointed out. This is the more remarkable when we know that the majority of the exhibitors kept back their plants as much as possible, in order that they might bring them forward on this occasion in the best condition of which they were capable.

The most important feature of the show was certainly the Orchids, which were, notwithstanding their great numbers, just in perfection, and altogether as fresh and beautiful as if it had been the middle of May. Messrs. Veitch had a remarkably fine group, in which were such masses of Phalænopsis, Dendrobiums, Aerides, Vandas, Lady's Slippers, Lælias (among which purpurata was conspicuous), and Anguloas, as have rarely been seen together before. Messrs. Rollisson also sent, among other fine things, a noble bush of Oncidium sphacelatum in admirable condition, Cypripedium Lowi, with two blooms on it; two large Sobralias, the rare Cattleya Aclandæ, and the curiously formed buff-flowered Bolbophyllum Lobbianum. Mr. Mylam, gr. to G. Reed, Esq., had some extremely good plants of the Moss Cattleya, the Fox-brush Aerides, the White Butterfly plant (Phalænopsis), Anguloa Clowesi, Cattleyas Skinneri and intermedia, Cypripedium Lowi with five flowers on it, and others in equally fine condition. These may be said to form the *élite* of the exhibitions of Orchids produced on Saturday last. Other groups demand little remark, having for the most part been fully noticed this season elsewhere. Some fine specimens of Phalænopsis in wire baskets, constructed on the principle of those permanently employed for "hanging plants" in the Palace, must not however be forgotten. These were furnished by Messrs. Veitch, and for the purpose of placing plants of this description in for exhibition they seemed perfect, their light and elegant forms associating well with the waving masses of flowers that overhung them.

The offering prizes for plants grouped for effect in or out of flower was a move in the right direction; but it was badly responded to by gardeners. Nurserymen did better, and the collections produced by Messrs. Veitch and Rollisson were really very skilfully and effectively staged. On the top shelf Messrs. Rollisson had a Norfolk Island Pine some 8 ft. in height, a Rhopala corcovadensis of similar altitude, with a pyramidal Erica Sindryana between them. In front of these were Nepenthes distillatoria loaded with pitchers; Cissus discolor clothed with foliage of remarkable beauty, and between them Oncidium flexuosum, while on the front or bottom shelf were Platycerium grande mounted on inverted pots (which, however, would have looked better had they been hid among Moss or Lycopods), and on one side of it was Aphelexis macrantha purpurea, and on the other Erica ventricosa magnifica—one of the very best of the class to which it belongs. On the left side of this centre piece were Gardenia Fortuni, with white flowers, large and double, and emitting a most delicious perfume; Angiopteris erecta, and Nephrolepis davallioides, a purple-coloured Azalea, a yellow Heath, two variegated Screw-Pines (Pandanus), the scarce Nepenthes lævis, Erica elegans, Lycopodium stolonferum, the rose-flowered Adenandra fragrans, and Caladium pictum, while on the right side were the Box and Oleander-leaved Eriostemons, Philodendron pertusum, Polygala oppositifolia (not in flower), a yellow Heath, a variegated Screw-Pine, Erica Westphalingii, Caladium hæmatostigma, a species with leaves spotted

with red, and Dendrobium nobile. The two sides of this group gradually fell from the centre to the extremities, and it will at once be seen that they were nicely balanced as regards colour.

Messrs. Veitch's collection was placed on the end of a stage with its wings extended on either side. On the top was the noble-looking tree Fern Dicksonia squarrosa, and in front of that a magnificent Cissus discolor, supported on both sides by Phalænopsis grandiflora, literally masses of flower. These last were backed—one by a yellow Oncid, the other by Dendrobium nobile. Each corner was furnished with a Norfolk Island Pine, associated with which were the yellow Dendrobium densiflorum, Azalea lateritia and coccinea, Philodendron pertusum and pinnatifidum, Aerides virens, and Cattleya Mossiæ. On the left of these were the fan-leaved Palm Livistona borbonica, Medinilla magnifica in the shape of a standard; Lilium giganteum, rising some 6 feet in height, and bearing a glorious head of a dozen large dropping white flowers, streaked with red; together with a yellow Heath, Platycerium grande, and Coleus Blumei, with reddish brown leaves, edged with pale green. The right wing comprised nearly the same plants as those just mentioned, in addition to which were a variegated Screw-Pine, and the Dragon tree, Dracæna Draco. The above were certainly the two most interesting groups exhibited, the intermixture of plants out of blossom, but with fine foliage, having the effect of setting off the others to more advantage than could otherwise have been the case.

Mr. Colyer's (of Dartford) collection consisted altogether of flowering plants, which exhibited little pretension of having been grouped for effect. The collection from Mr. Peed, gr. to Mrs. Tredwell, of Norwood, was tolerably well put up, but still its arrangement, compared with that of the two nurserymen just alluded to, was extremely deficient.

Of collections of Stove and Greenhouse plants, Mr. May, gr. to H. Colyer, Esq., of Dartford, had some immense bushes, among which the best were the fine Erica elegans which we have mentioned before; Leschenaultia formosa; Gompholobium polymorphum, a beautiful bush, trained so as to allow it to exhibit more of its natural habit of growth than usual; huge Epacrises, Boronias, Everlastings, Pimeleas, Eriostemons and Azaleas. Of these kinds of plants Mr. Green, gr. to Sir E. Antrobus, Bart., also had an exhibition, the chief feature of which was its Azaleas. Sir John Cathcart's gardener (Dods) and Mr. Farmer's gardener (Carson) likewise showed wonderfully fine specimens of stove and greenhouse plants; but these, as well as others produced on this occasion, were not sufficiently different from what have been already exhibited this season to render it desirable to occupy room with a detailed account of them.

Of plants with fine foliage Messrs. Veitch showed a large and striking collection. It contained Zamia pungens, Philodendron pinnatifidum, the Nepaul Berberry, Plectocomia elongata, Calamus viminalis, Sabal umbraculifera, Musa Cavendishi, Ceroxylon Andicola, and Dracæna Draco and indivisa; the last with a noble head of Yucca-like leaves mounted on a stem quite 3 feet in height. This, associated as it was with good-sized Palms and Cycads, had a very imposing effect. Much smaller than the foregoing, but still very handsome were the plants shown by Messrs. Rollisson. The more remarkable among them were perhaps Aralia integrifolia, Rhopala Estrellensis and magnifica, Dracæna gracilis and indivisa, and Lomatia australis. Other plants, with fine foliage, were Cissus discolor, Dioscorea zebrina, Maranta bicolor, Dracæna terminalis, Coleus Blumei, Canna discolor, and a Caladium or two.

Variegated plants were numerous; but being all, or very nearly so, small things, they produced no sort of effect. Messrs. Veitch had the best group, which contained Physurus pictus and argenteus, Coleus Blumei, Cissus discolor, a handsome variety of Maranta roseo-lineata, variegated Yuccas, Hydrangeas, Vines, and Screw-pines (Pandanus), Anæctochilus setaceus intermedius, Lowi, and xanthophyllus, Vriesia speciosa, Calathea zebrina, Caladium pictum, Maranta Warzewiczi, Dracæna terminalis, a variegated variety of Aspidistra lurida, and Ruellia maculata. Mrs. Lawrence's gardener (Franklin,) had Caladiums, Phryniums, Cissus, Marantas, Dieffenbachias, Crotons, the beautiful white-veined Aphelandra Leopoldi, Vriesia speciosa, with a long feather-like spike of scarlet bracts, and Eranthemum leuconervium. We also noticed some variegated Fuchsias, Ageratums, and hardy plants.

Ferns, both hardy and tender, were shown in abundance, and were much admired. The best came from Mr. Fletcher, gr. to J. F. Young, Esq., and from Messrs. Veitch. Of tender kinds the latter had fine plants of Nephrolepis davallioides, Asplenium nidus avis, an admirable plant; Adiantum cuneatum, trapeziforme, and pentadactylon, &c., all handsome; Acrostichum grande, Dicksonia Antarctica, Darea diversifolia, Blechnum braziliense, and one or two others. The hardy varieties were also well grown, and their peculiar colour and forms contributed greatly to the interest of the exhibition.

Lycopods were numerous, and some of them in their way extremely handsome. It is remarkable what fine forms have been introduced among these plants of late years. Mr. Williams, gr. to C. B. Warner, and Messrs. Veitch had both exhibitions of this singular tribe. Among them were L. braziliense, Willdenovi, denticulatum, cordatum, stoloniferum, cæsium and its arborescent variety, umbrosum, formosum, and apodum, the last a neat close-growing kind.

Cape Heaths, on this occasion, were in beautiful condition, more especially the fine plants shown by Messrs. Rollisson. Rhododendrons and Roses were also present, but the display they made was extremely poor. The latter, in fact, seemed almost lost in a corner by themselves. Tall Cacti were scarcely more effective, and we must not forget a large breadth of Gloxinias, among which, however, we saw nothing very new either in name or colour.

Of Pitcher plants there were some glorious examples from Messrs. Veitch. They consisted of Nepenthes ampullacea, Rafflesiana, Hookeri, lanata, and two unnamed sorts. Messrs. Rollisson also had a large pot full of the singular looking Australian Cephalotus follicularis, whose curious form attracted particular notice. Its rosettes of leaves and little pitchers half hid in a carpet of green moss were covered over with a bell glass.

Among new plants Messrs. Veitch had the golden Rhododendron Brookeanum from Borneo. It has glossy green foliage, and is altogether a fine addition to the genus. The same firm also showed R. californicum, a delicate pink kind, very different in appearance from those of the eastern mountains of America, or from any we have at present in cultivation, together with Weigela amabilis, and a branch of Embothrium coccineum from a wall literally loaded with brilliant orange scarlet flowers. This fine new Protead is said to be hardy in Devonshire, having stood these four last winters out of doors. This does not imply, however, that it will be hardy in other parts; but it may be expected to succeed with very little protection, and that much its beauty will amply repay. Messrs. Rollisson had Meyenia erecta, a shrub with a good habit, and covered all over with violet purple Achimenes-like flowers with a yellow eye. This will make an excellent addition to our present races of stove plants. Messrs. Jackson had a large flowered Clematis in the way of Azurea grandiflora; Messrs. Standish and Noble some Chinese Berberries, Azalea crispiflora, and Spiræa grandiflora; and Messrs. Veitch had Lomatia ferruginea, the Rice paper plant, a Sarracenia, and some variegated Orchids.

Florist Flowers were shown most extensively, and to think of alluding to the plants that made up the different exhibitions by name would be a hopeless task. Let it suffice to say that they formed no inconsiderable portion of the show. Pelargoniums were unusually abundant, and there were also Fuchsias, Calceolarias, Pansies, and Tulips; sufficient we should hope to satisfy the most ardent admirer of such things. What is wanted in these classes of flowers is variety, and this is a point to which exhibitors should pay attention when making up their collections, which should be varied in colour as much as possible. This seemed to have been very much overlooked on Saturday last.

The exhibition of fruit, as a whole, was a poor affair, and what was produced was most unskillfully arranged. Collections were furnished by Mr. Fleming, gr. to the Duke of Sutherland; and Mr. M'Ewen, gr. to the Duke of Norfolk. The most remarkable feature of Mr. Fleming's contributions was his Peaches and Nectarines, which were extremely good. He had also excellent Grapes, May Duke Cherries, and Melons. Mr. M'Ewen had well-ripened Grapes, a Queen Pine, Melons, Gooseberries, Currants, Raspberries, and some very fine Strawberries, among which was a dish of Hautbois.

Pine Apples, with one or two exceptions, were discreditable to the skill of British gardeners. Mr. Bailey, of Shardiloes, sent some well swelled fruit, especially a Providence, as did also Mr. Robinson, gr. to Lord Boston; and Mr. Barron, gr. to Mrs. Vivian, had a good Queen; but with these exceptions and perhaps a Queen from Mr. Constantine, there was nothing worthy of remark.

Grapes, as a whole, were better. Mr. Davis, of Oak Hill, had 12 lbs. of well swelled and beautifully coloured Black Hamburgh; Mr. Turnbull, gr. to the Duke of Marlborough, sent large and fine bunches of Muscat; but they were far from being ripe. Mr. Hill, gr. to R. Sneyd, Esq., had bunches of Black Prince well ripened and coloured. Black Hamburghs large, both in bunch and berry, and finely coloured, came from Mr. Dods, gr. to Sir J. Cathcart, Bart.; and Mr. Munro, gr. to Mrs. Oddie, had good fruit of the same variety. Very fine white Frontignans were communicated by Mr. Ayres, gr. to Lord Southampton; and Mr. Preller, of Ada Lodge, Tulse Hill.

Of Peaches and Nectarines the Duke of Sutherland's gr., Mr. Fleming, sent by far the best exhibition. It contained large and finely-coloured specimens of Violet Hative and Murray Nectarines, and Royal George and Grosse Mignonne Peaches. Mr. Constantine also produced well-ripened Royal George Peaches, and so did Mr. Gardiner, gr. to Sir G. P. Phillips, Bart. Of Nectarines, Mr. Fleming, Mr. Ayres, and Mr. Spencer, gr. to the Marquis of Lansdowne, all contributed good fruit. Among the sorts were the Violet Hative and Downton. Mr. Hill, gr. to R. Sneyd, Esq., had also fair fruit of the Elruge.

Melons were pretty plentiful. The heaviest (hybrid Persian) came from Mr. Munro, gr. to Mrs. Oddie. Mr. Boreham, gr. to Sir Fitzroy Kelly, sent a green-fleshed kind, which was considered second. Mr. Fleming had Trentham Hybrid. The best green and scarlet-fleshed fruits were exhibited by Mr. Munro, gr. to Mrs. Oddie, and Mr. M'Ewen, gr. to the Duke of Norfolk.

Figs came from Mr. Busby, gr. to J. S. Crawley, Esq.; Mr. Bean, gr. to H. Perkins, Esq.; Mr. Bailey, gr. to G. Harcourt, Esq., M.P., and Mr. Cotterill, gr. to the Earl of Lisburne.

Cherries, May Duke, Black Eagle, and Elton were furnished in beautiful condition by Mr. Fleming, from Trentham. The single dishes of this fruit were inferior.

Strawberries were excellent, especially the fine dishes of them from the Duke of Norfolk's garden at Arundel. The varieties were British Queen, not quite coloured to the point, Keens' Seedling, Myatt's Eleanor, and Trollop's Victoria. These were large and well coloured. Mr. Turnbull also furnished good dishes from Blenheim. Mr. Constantine sent Dickson's Pine and Sir Charles Napier. Other varieties of Strawberry were Nimrod, Alice Maude, British Queen, Mammoth, and Goliath.

Of Vines in pots Mr. Constantine had some remarkably dwarf plants, with fine bunches of fruit on them. Other exhibitions of this kind were anything but good.

Other fruit consisted of Oranges, Citrons, Prickly Pears, Bananas, and Winter Cherries.

Reviews.

On Human Longevity and the Amount of Life upon the Globe. By P. Flourens. Translated from the French (second edition), by Charles Martel. London: Bailliere. 12mo, pp. 180, price 3s.

Our readers will perhaps be surprised at being told that the normal age of man is 100 years, and that old age does not begin until threescore years and ten have been actually accomplished. And yet so it is according to one of the greatest of living physiologists, who, moreover, does not speak dogmatically, but rests his opinion upon many carefully observed facts. It has long been known that the duration of life bore a certain ratio to the duration of growth, but the certain sign that marks the term of growth was not known. M. Flourens finds this sign in the union of the bones with their epiphyses. "As long as the bones are not united to their epiphyses, the animal grows; when once the bones and their epiphyses are united, the animal grows no more."

"The relation pointed out by Buffon is very near the truth. He says that every animal lives nearly six or seven times as long as the term of his growth. The true relation is five, or very nearly. Man being 20 years growing, lives five times 20, that is to say, 100 years. The camel is eight years growing, and lives five times eight, or 40 years. The horse is five years growing, and he lives five times five, that is to say 25 years; and so with the rest. We have then finally a precise characteristic which gives us accurately the duration of growth; the duration of growth gives us the duration of life. All the phenomena of life are united by the following chain of relations:—The duration of life is given by the duration of growth; the duration of growth is given by the duration of gestation; the duration of gestation, by the height, &c. The larger the animal, the longer is the time of gestation. The gestation of the rabbit is 30 days; that of man is nine months; that of the elephant is nearly two years," &c.

Many other statements equally curious and interesting are to be found scattered throughout this little work. The most valuable portion of it is perhaps that which relates to species, and in which the *coup de grâce* is given to the metaphysical notion of the *pre-existence of germs;* but for the author's views on these matters we must refer to the book itself, which we venture to say no one will regret having perused with attention.

FLORICULTURE.

Pyramidal Fuchsias.—As decidedly the best collection of Fuchsias shown at Sydenham on Saturday last consisted wholly of plants of this shape, I give you my plan of growing them, and I hope that Mr. Bousie, the exhibitor of the group in question, will favour your readers with his mode of cultivation next week. I put a few old plants in a warm pit or Vinery, where the temperature ranges about 55°, about the end of January or beginning of February, in order that they may have pushed out plenty of young wood by the middle of March. I then take off what cuttings I can get from each sort, preferring the shortest jointed wood. First prepare as many 4-inch pots as you may require, taking care that they are well drained, and the compost of a sharp open nature—coarse river sand intermixed with leaf-mould will be found to answer very well with about one inch of silver sand on the top for the purpose of inducing the cuttings to root freely. Water gently with a fine rosed pot, then plunge the pots in the propagating pit, where there is a gentle moist bottom-heat, where in the course of three weeks they will have made roots enough to stand potting off. You may now pot off singly into 3-inch pots in a light open sifted compost of rich loam, leaf-soil, and sand, equal parts, and if you have any bottom-heat to spare they will be the better to be plunged in it for a day or two, to give the young roots a start. They may now be removed to a warm pit or Vinery, or whatever you find most convenient, where the atmosphere is kept moist, which will ensure a strong, healthy, and vigorous growth. When you find the pots full of roots repot into 6-inch pots, using for this shift a good rich compost of turfy loam two parts, one of old rotten cow droppings, leaf-soil and sand. As this will be their last shift this season, care must be taken to provide good drainage; this can be secured by putting in plenty of potsherds, with two or three bits of open turf or Moss

over all. As the plants will now be pushing strongly, they must be tied to a neat stake, as they will be sending out laterals or side shoots. As the making of these side branches secures the formation of the plant, a little weak sheep dung liquid manure will be found very beneficial at this period of their growth. As the first tier of laterals has made their first joint, pinch it at that; this will not only enable you to have two shoots from each lateral, but will cause the leader to push away, and furnish you with plenty of side wood. The four first tiers of laterals will be enough to pinch this season, the rest may be allowed to grow on. They will be forming nice little plants now, so they may as well be taken to the greenhouse or conservatory, where, with a gay profusion of flowers, they will assist in keeping the house "dressy" for a short time. By the middle of November water should be withheld gradually, in order to ripen the wood, and they may be placed in a dry cold pit, or any out-of-the-way place, such as under the greenhouse stage, for instance, where they must remain all winter, as they will require no more attention till the end of February, when a little water may be applied sparingly to induce them to start; the knife must now be applied to cut back the side shoots that were pinched last year, to the second joint on the wood they made after they were pinched, and a couple of tiers of single shoots to the second joint, the rest to the first, and the leader to within 4 inches; thus you will have a pyramidal basis to work on. Place them now in a warm Vinery, and they will soon show indications of rapid growth. After they are fairly started turn them out of their pots, and shake off all loose soil, and examine the roots; repot now in 10-inch pots, using strong fibry loam of a rich texture, old cow dung, leaf soil and sand, equal parts well mixed. As stated for last season, attend well to drainage, as they will require no more pot room this season; replace them again in heat, and pinch in according to the directions laid down for last season, always aiming at having the plant broad and full at the pot, and tapering to the top. Pinching should, however, be stopped after the 1st of June, for by the middle of the month they should get a prominent place in the conservatory, where, by July, they will be the objects of greatest admiration in the house; liquid manure must not be omitted upon any account, at least three times a week, as this is now the only thing the plant will derive its nourishment from, and will cause it to bloom right on till October, when it will be getting unsightly, and may be removed out of doors to make room for some other favourite. When cold nights set in remove them as before to a cold pit, &c. No more attention will be necessary till spring, when they may be pruned and started according to the time they are wanted in bloom. They can be had in bloom by putting a few into heat by the beginning of January, about the middle of May; others, started accordingly, will enable you to have them in flower all the summer. Mr. Bousie's plants to be so fine now were doubtless struck in autumn; mine are chiefly for display late in summer. *W. F.*

Calendar of Operations.

(*For the ensuing week.*)

PLANT DEPARTMENT.

Conservatory, &c.—Many of the twiners in this house, as Passifloras, Tacsonias, Bignonias, Mandevilla suaveolens, Tecoma jasminoides, &c., will be growing rapidly, and will require frequent attention to keep them properly trained. The young shoots must not be tied in too close, however, but should be carefully directed until the space allotted to each plant is fairly covered; and after this is accomplished, training and stopping should be done merely with a view to equalise the growth, allowing the shoots to ramble in a natural manner as far as due regard to space and the admission of light to the plants under them will admit; for these things never produce so pleasing an effect as when allowed to hang in graceful festoons, or to ramble in their own natural way. The blooming of the choicer varieties of Passion-flowers, Tacsonias, &c., will be considerably accelerated by stopping the shoots, but this should not be done until part of the branch is tolerably firm and ripe, otherwise the effect would be the opposite of that desired.

FORCING DEPARTMENT.

Pineries.—Where the quality of the fruit is the first consideration, which it is or should be in every instance, care must be observed to have the soil about the roots in a rather dry state during the ripening period, and where it can be done without injuring the rest of the stock the atmosphere should be kept rather dry, admitting air more freely while the fruit is colouring: for there is no chance of fruit of prime quality if the soil is very wet about the roots, and the atmosphere kept close and saturated with moisture during the ripening period. In the case of plants growing in pots the trouble of collecting and placing together those approaching ripeness, so as to be able to treat them properly, would be well repaid. Now that we have something like summer weather give air freely to the growing stock, particularly in the case of plants that may have been making rather weakly growth, but shut up early in the afternoon, dewing the plants lightly with the syringe, and sprinkling every available surface, so as to secure a thoroughly moist atmosphere. Use fire heat as sparingly as may consist with maintaining the proper degree of temperature. Be very careful to keep the plants properly supplied with water at the root, and give plenty of manure-water to those in vigorous growth, and also to plants swelling their fruit.

Vineries.—Where Muscats are grown for a late crop the night temperature of the house must not be allowed to fall too low after the bunches begin to appear, and a temperature of from 65° to 70° must be maintained while the fruit is setting to ensure good sized, close bunches. Keep a sharp look out for red spider in houses where the fruit is colouring, and if this pest makes its appearance lose no time in coating the hot-water pipes with sulphur. If not already done get the litter removed from the outside borders, but if it is found that the roots have crept up into it, which will probably be the case where the Vines were started early in the season, the decayed portion at the bottom should be left, and every caution used not to disturb the young roots. And if many roots are found at the surface it will be necessary, after removing the litter, to top-dress the border to prevent these getting dried up; a slight coat of turfy loam, leaf soil, and horse-droppings will answer very well for this purpose. See that the borders of houses, where the fruit is swelling, are not allowed to get too dry.

FLOWER GARDEN AND SHRUBBERIES.

The weather for some days past has been just such as we like for planting out the bedding stock—warm and rather cloudy, with occasional showers—and, of course, the work of planting-out should be well nigh if not altogether finished before this appears. Get Verbenas, Petunias, and other things liable to be injured by wind pegged down as soon after planting out as possible, placing the shoots so as to cover the soil equally; and let Dahlias be securely tied to sufficient stakes at once, if not already done. No labour should be spared which may be necessary to properly care for the plants until they get fairly established, when, if the beds have been properly prepared, they will care for themselves during the rest of the season. See that plants in vases are properly supplied with water, as, if allowed to get too dry at the root but for a single day in bright weather, before they get well inured to exposure and fairly established, the foliage is sure to be injured and the appearance of the plants spoiled for some considerable time. And should the weather prove warm and dry the whole stock of bedded out things must be well attended to with water, and will be greatly benefited by a liberal sprinkling every evening, but to water a large stock every evening is next to impossible where the amount of labour is limited and water not within reach; but those who expect their flower-beds to be as well filled and covered with flower in July as any in the country must make up their minds to maintain a successful contest with dry weather at any necessary expense. And in most situations proper arrangement and a trifling outlay in laying down pipes fitted with union-joints would, with a hose, render any amount of watering which might be necessary in the dry seasons a very trifling affair. We would not be understood, however, as recommending frequent heavy waterings, but merely that the soil should be kept in a healthy moist state, and any labour bestowed in the way of moistening the surface of the beds on the evenings of bright days will be well repaid. Use every possible dispatch to bring up any arrears of work in this department which may have accumulated during the time the hands have been employed in planting out; and now that the weather is such that the owners of gardens can enjoy them, let everything be in the most perfect order that circumstances will permit.

HARDY FRUIT AND KITCHEN GARDEN.

Now that we have nice growing weather, see that every shoot on the Peach and Nectarine trees is free from insects, and otherwise lose no time in getting them cleaned. If not yet done, disbudding should be completed at once, in order that the strength of the trees may be thrown into what is to be the bearing wood for next season. Where covering of any kind has been used, this should also be removed, if not previously done. See that Cherries are not allowed to suffer from their enemy the black fly, and endeavour to keep all fruit trees perfectly clear of insects. The early Celery should be planted out without loss of time, and this must be well supplied with water until it gets established, and indeed throughout the summer. If not planted between lines of Peas, or in a shady situation, the plants should be protected from bright sunshine for a week or so after planting, and see that there are plenty of plants coming on for the succession and late crops. Give all necessary attention to Tomatoes, ridge Cucumbers, &c., until they get fairly established. After well soaking the Strawberry beds with water the surface should be mulched in order to keep the ground cool and prevent evaporation. It is a very usual practice to use the mowings of the lawn for this purpose; but this is the very worst article that could be used, as it spoils the fruit by adhering to it, and in damp weather imparts to it an unpleasant flavour, and hastens decay. Next to tiles or slates clean straw is the best article for this purpose, and where this cannot be obtained the rankest portion of the litter from the stable-yard may be used instead, and there need be no fears entertained about this spoiling the flavour of the fruit for exposure to the air, and a few showers will perfectly sweeten it, and although more troublesome to apply it will be found to answer the purposes as well as clean straw. Give Asparagas beds a liberal supply of manure-water, and where there is plenty of this at command it may be given with advantage to such things as Cauliflowers, Lettuces, &c. Keep the surface soil frequently stirred among all growing crops, which will prevent the growth of weeds and strengthen the plants.

STATE OF THE WEATHER AT CHISWICK, NEAR LONDON,

For the week ending June 7, 1855, as observed at the Horticultural Garden.

June.	Moon's Age.	Barometer. Max.	Barometer. Min.	Temperature of the Air. Max.	Temperature of the Air. Min.	Temperature of the Air. Mean	Temperature of the Earth. 1 foot deep.	Temperature of the Earth. 2 feet deep.	Winds	Rain in inches.

Average.		29.899	29.823	69.3	46.5	57.9	54.9	53.9		

June 1—Densely overcast; cold at night.
— 2—Overcast; cloudy and fine; clear at night.
— 3—Fine; cloudy; overcast; rain.
— 4—Heavy clouds; very fine; cloudy and fine.
— 5—Cloudy throughout; fine at night.
— 6—Very fine; hot, and air excessively dry; thunder clouds; rain at night.
— 7—Cloudy and fine; very fine throughout.

Mean temperature of the week ½ deg. below the average.

RECORD OF THE WEATHER AT CHISWICK,

During the last 29 years, for the ensuing week, ending June 16, 1855.

June.	Average Highest Temp.	Average Lowest Temp.	Mean Temp.	No. of Years in which it Rained.	Greatest Quantity of Rain.	Prevailing Winds N	NE	E	SE	S	SW	W	NW
Sunday 10	71.0	48.4	59.7	13	0.95 in.	1	6	1	2	3	[illegible]	[illegible]	[illegible]
Mon. 11	71.8	49.4	60.6	10	0.47	—	7	2	1	3	[illegible]	[illegible]	[illegible]
Tues. 12	71.3	50.3	60.8	13	0.78	—	5	3	1	5	[illegible]	[illegible]	[illegible]
Wed. 13	72.0	49.3	60.6	13	0.77	1	5	3	1	2	[illegible]	[illegible]	[illegible]
Thu. 14	72.8	49.7	61.2	13	0.36	1	2	4	1	6	[illegible]	[illegible]	[illegible]
Frid. 15	72.5	50.2	61.3	13	0.38	1	4	5	2	4	[illegible]	[illegible]	[illegible]
Satur. 16	72.1	49.5	60.8	12	0.20	2	3	5	1	7	[illegible]	[illegible]	[illegible]

The highest temperature during the above period occurred on the 12th and 13th, 1842—therm. 90 deg.; and the lowest on the 15th, 1850—therm. 30 deg.

Notices to Correspondents.

Broccoli: *Melville.* The heads you have sent appear to be those of Dillcock's Bride, which is one of the most useful Broccolies we possess.

Deodar Seed: *M G.* Sow it like Larch or Cedar of Lebanon—nothing can be easier.

Diseases: *Colo.* It is almost impossible to ascertain the nature of disease from specimens subject to the pressure of stamping which destroys every character. Morbid specimens should be sent in little boxes whose walls are strong enough to resist a heavy blow. The foliage of your Onions, and their roots, were utterly destroyed. The growth of the first leaf is similar to that which usually occurs in what are called thick necked Onions; but, besides this, the whole plant is in a chlorotic state, accompanied by an unnatural succulence. The affection is new to us, and we should have been glad to have seen more perfect specimens. The only alteration we can suggest is to change your ground, and if you are in the habit of saving your own seed, do not trust to it, but get a supply from some other quarter. Had you sent your address, we should have communicated with you directly.—*W S.* The Peach leaves are very curious. It is not an ordinary case of curl, a disease which is usually attributed to cold; but though in general very common in this neighbourhood, I am unable to obtain a single specimen of the true curl for comparison. The white substance efflorescence is due to a very curious species of Ascomycon, of which we shall have more to say upon some future occasion. In the meantime we should strongly advise you to dredge your trees with sulphur. *M. J. B.*

Heating: *Barnstaple.* There is no objection to using gas for this purpose, provided you can secure the stove from leakage or allowing the gas to escape into the house. This is very difficult to accomplish. If you do use gas you should place an evaporating pan of water near the source of heat, with a view to preventing the air of your house becoming over heated.

Insects: *J S* says the early buds on a great number of young Plum trees in a nursery at Malton have been in a great measure destroyed by a small beetle, Sitona ruficlavis, one of the Curculionidæ, and he would be glad if any one can point out any method by which its devastations may be prevented.—*A Constant Subscriber.* 1, Curculio (Nemoicus) oblongus, occasionally injurious by eating Apple bloom; 2, Telephorus pallidus, harmless, larva in earth feeds on small insects; 3, Curculio (Phyllobius) Pyris, harmless; 4, Dilophus femoratus, harmless; 5, Bibio Johannis, harmless.—*T L, Broadstairs.* The branch has been weakened by the burrows of the caterpillar of the Wood Leopard moth (Zeuzera Æsculi). You do not state what tree it is?—*Even.* Your young Pears are infested with the larvæ of the Sciara pyri, a little gnat; the eggs of which were most probably deposited in the flowers. You will oblige us by sending a dozen or two more of the infested Pears that we may try to rear the fly.—*W W F.* The Sycamore leaves show minute blotches, which may either be incipient galls or exudations arising from the bites of aphides or spots resulting from diseased cells of the leaf. Mr. Waterhouse never supposed that the stag beetle sucks with its large horny jaws. W.

Names of Fruits: *W B.* Probably the Stone Pippin.

Names of Plants: We have been so often obliged to reluctantly decline naming heaps of dried or other plants, that we venture to request our correspondents to recollect that we never have, or could have undertaken an unlimited duty of this kind. Young gardeners, to whom these remarks more especially apply, should bear in mind that, before applying to us for assistance, they should exhaust their other means of gaining information. We cannot save them the trouble of examining and thinking for themselves; nor would it be desirable if we could. All we can do is to *help* them—and that most willingly. It is now requested that, in future, not more than four plants may be sent us at one time.—*W B.* 1, Omphalodes verna: 2, probably Boldoa fragans, but it has no flowers.—*Ashford.* Euphorbia Lathyris, a poison!—*M J B.* Pernettya mucronata.—*Constant Reader.* Lonicera tatarica.—*Buxton.* 2, Asclepias curassavica. 1 cannot be named without a better specimen.—*J P.* Plants not in flower cannot be named. It may be a leaf of Funkia ovata, *alias* Hemerocallis cærulea.—*Q.* 1, Some Gardenia or Tabernæmontana; not ascertainable from such a miserable morsel. 2, Cyanotis vittata.

Paris: *An Old Sub.* We can only answer horticultural inquiries. Since you can't speak French you must get an interpreter—that is indispensable. Then visit the nurseries of Cels, Mathieu, Noisette, Jamin, &c., the Peach gardens of Montreuil, and the Vine gardens of Fontainebleau. Look at Versailles for its Orange trees and Potager, the Garden of Plants for its rarities and capital Pear growing, the market gardens generally, and Père la Chaise to see how the French manage cemetery plants. If you return by Brussels look at the Botanic Garden there, and the establishments of Linden and de Jonghe. They will tell you what else to seek for on your passage homewards. Provide yourself with Murray's "Handbooks."

Vines: *Bradford.* Certainly not oidium; probably nothing more than blisters (or vegetable pimples) brought on by over-feeding.

Water: *G R.* The use of water from an artesian well is not prejudicial in watering plants of any kind, flowering or fruiting, either at the root or leaf, unless it is charged with lime, in which case it is fatal to Heaths, Rhododendrons, and all such calcareous races. It is, however, in every respect inferior to pond-water.

*** As usual, many communications have been received too late and others are unavoidably detained till the necessary inquiries can be made. We must also beg the indulgence of those numerous correspondents, the insertion of whose interesting contributions is still delayed.

PERUVIAN GUANO, Bolivian Guano, Superphosphate of Lime, Nitrate of Soda, Sugar Scum, and every description of Artificial Manures, Linseed Cakes, &c.
WM. INGLIS CARNE, 10, Mark Lane, London.

PATENT SANITARY SEWAGE COMPANY'S NITRO-PHOSPHATED CARBON OR BLOOD MANURE, 5l. 10s. per ton: delivered in London, bags included. Each ton contains 1350 lbs. Blood and 11 per cent. of Phosphate of Lime.—Agents throughout the country.
22, Lincoln's Inn Fields, London.

THE FOLLOWING MANURES are manufactured at Mr. LAWES' Factory, Deptford Creek:—Turnip Manure, 7l. per ton; Superphosphate of Lime, 7l.; Sulphuric Acid and Coprolites, 6l.
Office, 69, King William Street, City, London
N.B. Genuine Peruvian Guano, guaranteed to contain 16 per cent. of ammonia. Nitrate of Soda, Sulphate of Ammonia, and other Chemical Manures.

TURNIP MANURE.—Superphosphate of Lime delivered to any Warehouse in London at 6l. per ton.
Professor Nesbit's Analysis given with Invoice.
Apply to CHARLES TOTHILL & Co., Manufacturers, Plaistow Marsh, Essex.

TURNIP SOWING.—The Undersigned beg to offer their valuable Supherphosphate of Lime (See "Royal Agricultural Society's Journal," Vol. VI., Part 2), Turnip Manure, and Nitro-phosphate or Blood Manure.
Also on sale, Guano, Nitrate of Soda, Gypsum, Bone-dust, Sulphuric Acid, Salt, and all other Manures of known value. Agents for the sale of Peat Charcoal.—Apply for Prices Current to MARK FOTHERGILL & Co., 204A, Upper Thames Street, London.

CORN MANURE FOR SPRING SOWING.
CONCENTRATED URATE FOR GRASS, RAPE, AND ALL ROOT CROPS.
SUPERPHOSPHATE OF LIME.
THE LONDON MANURE COMPANY continue to manufacture the above Manures, which have been used with so much success for the last 14 years.
The London Manure Company also supply PERUVIAN GUANO (direct from importers' warehouses), Nitrate of Soda, Sulphate of Ammonia, Fishery and other Salts, Bone Dust, and every artificial manure of known value. EDWARD PURSER, Sec.
Office—40, Bridge Street, Blackfriars.

MANURES.—The following Manures are manufactured by HODGSON & SIMPSON, Calder Soap Works, Wakefield, and MATTHEWS & Co., Manufacturing Agricultural Chemists, Driffield. SIMPSON'S AMMONIA PHOSPHATE, a valuable Top-Dressing for Wheat, Barley, and Oats. SIMPSON'S NITRO-PHOSPHATE for Turnips, Potatoes, and all other bulbous root crops, price 8l. per ton. N.B. Manures specially prepared for Grass and Flax. The above have been successfully tested for the last Seven Years by the leading farmers in Yorkshire and Lincolnshire, and other counties, and were applied last season to a breadth of upwards of 15,000 acres of land with the most beneficial results to the crops. A List of Testimonials and other particulars will be forwarded by post on application.

UNIVERSITY COLLEGE, TORONTO, UPPER CANADA.
AGRICULTURAL DEPARTMENT.
THE PROFESSOR OF AGRICULTURE, who resides on the Experimental Farm attached to the College, is prepared to receive into his family a small number of Pupils, who will have the advantage of entering on an extensive course of Collegiate Studies in connexion with Agriculture, on very easy terms.—Particulars and References may be obtained of Mr. H. G. AUSTEN, 259, High Street, Borough, London; or by addressing Professor BUCKLAND, University College, Toronto, Upper Canada.—June 1855.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.
Professor WAY'S LECTURE, "On the Use of Fish as a Manure," is postponed from the 13th to the 27th of June, at 12 o'clock.—By Order of the Council, JAMES HUDSON, Secretary.

SMITHFIELD CLUB, 1855.—The CHRISTMAS SHOW of FAT CATTLE, SHEEP and PIGS, will take place on TUESDAY 11th, WEDNESDAY 12th, THURSDAY 13th, and FRIDAY, 14th of December, at the Carriage Bazaar, King Street, Baker Street, Portman Square.

HIS GRACE THE DUKE OF RICHMOND, K.G., *President.*

Vice-Presidents.
The Most Hon. the Marquis of Huntly.
Philip Pusey, Esq.
The Right Hon. the Earl of Hardwicke.
The Right Hon. Earl Spencer, K.G.
The Right Hon. the Earl of Yarborough.
The Right Hon. Lord Berners.

Trustees.
His Grace the Duke of Richmond, K.G.
Mr. B. T. Brandreth Gibbs.
The Right Hon. Lord Portman.

Stewards.
DRAFTS AND LONG-WOOLLED SHEEP: Mr. L. Willmore. Mr. Thomas Greetham. Mr. James Hole.
SHORT-WOOLLED SHEEP, CROSS-BRED SHEEP, AND PIGS: Mr. Edward Pope. Mr. James S. Turner. Mr. Edward Frost.

Bankers.—Messrs. Hoare, Fleet Street.
Honorary Secretary.—Mr. B. T. Brandreth Gibbs.
Office of the Honorary Secretary, at Messrs. Thomas Gibbs & Co., the Seedsmen to the "Royal Agricultural Society of England," &c., Corner of Half-Moon Street, Piccadilly, London.
A sum of nearly 800l. will be awarded in prizes and medals as under:—

	£.
Devon Steers, Oxen, Heifers, and Cows	120
Hereford " " " "	120
Short-horn " " " "	120
Scotch or Irish Steers and Heifers	15
Welsh Oxen and Runts—Heifers and Cows	30
Pure-bred Steers, Oxen, Heifers, and Cows, of any other breeds	20
Cross or mixed bred Steers, Oxen, and Heifers ...	40
Long-woolled Wether Sheep	80
Cross-bred " "	25
Short-woolled " "	80
Pigs of all Breeds	45
5 Gold Medals | 35 Silver Medals	

MEMBER'S SUBSCRIPTION.—The Annual Subscription to the Club is One Guinea, payable in advance for the year ensuing. Any Member of the Club who has paid up all Arrears of his Subscription, or any New Member upon his Admission, may compound for all future Annual Subscriptions, by the payment of Ten Guineas.
NON-MEMBER'S FEES.—All Non-Members wishing to exhibit at the Club's Show must pay a Fee of One Guinea towards the funds of the Club: such Fee to be paid to the Honorary Secretary previously to his furnishing the Admission Order, &c.
The last day for Certificates to be received by the Honorary Secretary is SATURDAY, November 10.
Prize Sheets are now ready, containing the Rules of Exhibition and all particulars, and may be had, free by post, on application to B. T. BRANDRETH GIBBS, Hon. Secretary,
Corner of Half-Moon Street, Piccadilly, London.
N.B. It is particularly requested that all communications to the Hon. Secretary bear *outside* the words "Smithfield Club."

COLLEGE OF AGRICULTURE AND CHEMISTRY, AND OF PRACTICAL and GENERAL SCIENCE, 37 and 38, Lower Kennington Lane, Kennington, near London.
Principal—J. C. NESBIT, F.G.S., F.C.S., &c.
The system of studies pursued in the College comprises every branch requisite to prepare youth for the pursuits of Agriculture, Engineering, Mining, Manufactures, and the Arts; for the Naval and Military Services, and for the Universities.
Analyses and Assays of every description are promptly and accurately executed at the College. The terms and other particulars may be had on application to the Principal.

ARTIFICIAL MANURES, &c.—Manufacturers and others engaged in making ARTIFICIAL MANURES may obtain every necessary instruction for their economical and efficient preparation, by applying to J. C. NESBIT, F.G.S., &c., Principal of the Agricultural and Chemical College, Kennington, London. Analyses of Soils, Guanos, Superphosphates of Lime, Coprolites, &c., and Assays of Gold, Silver, and other Minerals, are executed with accuracy and dispatch. Gentlemen desirous of receiving instructions in Chemical Analyses and Assaying, will find ample facility and accommodation at the College.

THE GENERAL LAND DRAINAGE AND IMPROVEMENT COMPANY
INCORPORATED BY SPECIAL ACT OF PARLIAMENT.
Offices, 52, Parliament Street, London.
DIRECTORS.
HENRY KER SEYMER, Esq., M.P., *Chairman.*
SIR JOHN V. SHELLEY, Bart., M.P., *Deputy-Chairman.*
George Thomas Clark, Esq.
John C. Cobbold, Esq., M.P.
Sir William Cubitt, F.R.S.
Henry Currie, Esq.
Thomas Edward Dicey, Esq.
William Fisher Hobbs, Esq.
Edward J. Hutchins, Esq., M.P.
Sir S. M. Peto, Bart.
William Tite, Esq., F.R.S.
William Wilshere, Esq.
Empowered to execute Drainage, Road-making, and other Land Improvements, and to Erect Farm Buildings upon Estates under Settlement, Mortgage, or otherwise; or Church property, and without investigation of Title to charge the whole outlay and expenses upon the Estate, to be repaid by instalments spread over any period determined by Landowners within the limits of 50 years for Drainage and Roads, and 31 years for Farm Buildings.
Landowners may arrange with the Company for the execution of the works by their own agents, with the use of their own or the Company's Capital. WILLIAM CLIFFORD, Sec.

THE LANDS IMPROVEMENT COMPANY, INCORPORATED BY SPECIAL ACT OF PARLIAMENT FOR ENGLAND AND SCOTLAND.—To Landowners, the Clergy, Solicitors, Surveyors, Estate Agents, &c.—Loans may be contracted for the execution by the proprietor or by the Company of every landed improvement, especially Drainage, Building, Clearing, Enclosing, Warping, Irrigation, Embanking, Reclamation, Roads, Planting, Machinery, &c. The plans (of buildings), specifications, and estimates are prepared by the proprietors, and are submitted to the approval of the Enclosure Commissioners. Proprietors may avail themselves of the powers of the Act to recover from the inheritance their own funds to be expended on improvements. They may also apply jointly for the execution of a mutual improvement, such as a common outfall, &c. For forms of application, &c., apply to the Hon. WM. NAPIER, Managing Director, 2, Old Palace Yard, Westminster.

IMPORTANT TO AGRICULTURISTS.

PATENT
LIQUID-MANURE DISTRIBUTOR OR WATER-CART.
ISAAC JAMES, Tivoli, Cheltenham, begs most respectfully to solicit the attention of Agriculturists and others, to his newly-invented Patent Liquid-Manure Distributor, or Water-Cart. The advance of science having so exhibited to Agriculturists the superior advantage of using Liquid-Manure, as to induce its almost general adoption, a great want was felt for a Distributor, so constructed, as to answer the purpose of equally distributing any quantity, without being liable to clog up, and thus hinder the progress of the work, and waste the time of the workman, and yet produced at a price alike available to the small farmer or gardener, as to the more wealthy and extensive cultivator.
I. JAMES warrants his Distributor to supply the desideratum so long felt. Its superiority consists in possessing the following advantages:—
1. It has two Strainers, so arranged as to prevent anything but liquid entering into the Distributor, so that it is impossible for it to clog up. 2. The liquid is forced through the Distributor so as scatter any quantity on the land, in a copious shower from 10 to 15 feet wide (according to size), which saves a great amount of time and labour. 3. It has waterproof joints, so that the liquid may be carted to any distance without wasting it. 4. It will work equally well on hilly as on level land, without any alteration. 5. It can be advantageously adapted for the Distribution of Guano, &c., on either Drilled Crops or Pasture Land. 6. It is so constructed as to be thoroughly adapted for Watering Streets. 7. It works so simply that even a boy can superintend it.
PRICES:—
250 gallons, suitable for working by horse, £22 weight of cart, 8¼ cwt., tire 4 inches.
150 do. do., £18 weight of cart, 6½ cwt., tire 3 inches.
70 do. by pony, 11 " 3½ cwt., tire 2½ "
40 do. by man, 9 " 2½ cwt., tire 2 "

WATERPROOF PATHS.
BARN AND CATTLE SHED FLOORS.
THOSE who would enjoy their Gardens during the winter months should construct their walks of PORTLAND CEMENT CONCRETE, which are formed thus:—Screen the gravel of which the path is at present made from the loam which is mixed with it, and to every part of clean gravel add one of sharp river sand. To five parts of such equal mixture add one of Portland Cement, and incorporate the whole well in the dry state before applying the water. It may then be laid on 2 inches thick. Any labourer can mix and spread it. No tool is required beyond the spade, and in 48 hours it becomes as hard as a rock. Vegetation cannot grow through or upon it, and it resists the action of the severest frost. It is necessary, as water does not soak through it, to give a fall from the middle of the path towards the sides.
The same preparation makes first-rate paving for BARNS, CATTLE-SHEDS, FARM-YARDS, and all other situations where a clean, hard bottom is a desideratum. May be laid in winter equally well as in summer.
Manufacturers of the Cement, J. B. WHITE & BROTHERS, Milbank Street, Westminster.

CAUTION.
PARKES' STEEL DIGGING FORKS AND DRAINING TOOLS.
Whereas very inferior descriptions of Steel Digging Forks are now manufactured and sold, and I have been informed that purchasers of the same have believed them to be the same as those manufactured by me, and to which the Royal Agricultural Society and numerous Agricultural Societies' prizes have been awarded, I hereby respectfully inform the public that every Fork manufactured by me is stamped with my trade mark "J. P.," and that Messrs. BURGESS & KEY, of No. 103, Newgate Street, London, are my sole Wholesale Agents, and I have authorised them to replace to the purchaser every Fork of my manufacture found defective; they will also on application send Wholesale and Retail Price Lists, &c., post free. FRANCIS PARKES & Co.

SAMUELSON'S REGISTERED LAWN MOWING MACHINES. To cut 16, 19, 22, and 25 inches wide. The Registered Improvement renders unnecessary the great care requisite in the handling of these Machines on the old plan. All that is now required can be done *by any unskilled labourer*, who has only to push the Machine before him, the Registered Adjustment insuring a clean cut of uniform height, and preventing the knives from cutting into the soil, however uneven the ground may be. Illustrated Price Lists, with copies of Testimonials, and a Catalogue of his other Agricultural Implements, may be procured, post-paid, on application to the Manufacturer,
B. SAMUELSON, Britannia Works, Banbury, Oxon.
The above may also be procured at the principal Agricultural Implement Depôts in London, and of all respectable Ironmongers and Seedsmen in the country.

BUDDING'S GRASS-CUTTING MACHINE, nearly new and in first-rate condition, to be Sold a bargain. Cuts, Rolls, and Sweeps the Grass whether wet or dry at one operation. Admirably adapted for lawns, pleasure grounds, &c. On view at W. S. MULLINGER'S, General and Furnishing Ironmonger, Enfield, Middlesex.
W. S. M. has also on sale a large and well assorted stock of Garden Tools of every description. Galvanised Wire Netting, 3-inch mesh, 2 feet high, 6d. per yard run. Iron Hurdles and Continuous Fencing made to order. Greenhouses or Conservatories heated with hot water apparatus on the best principle by experienced workmen. Estimates given.

CLAYTON, SHUTTLEWORTH, AND CO.'S PRIZE PORTABLE STEAM ENGINES, AND COMBINED THRESHING, STRAW SHAKING, RIDDLING AND WINNOWING MACHINE may be seen at their London Establishment, 6, Fitzroy Terrace, New Road, where all information relative thereto can be obtained. These Machines are constructed to horn Barley, and make a perfect separation of the chaff from the pulse. They are fitted with Elevators, which deposit the grain into bags, and beyond the feeder of Machine require no hands except to take away the Corn, &c., as threshed, the whole of the operations being performed by self-acting machinery, whereby the Corn, Straw, Chaff, and Pulse are delivered in the places assigned for them.
C. S. & Co. have paid special attention to this class of Machinery, and Fixed Barn Machinery, and from the position they have taken at the Royal and all the leading Agricultural Shows of England, flatter themselves that for efficiency, durability, and simplicity, their Engines and Machines are not surpassed by any other maker in England. All letters forwarded to the Works at Lincoln will have immediate attention; and Illustrated Catalogues forwarded to all parts of the kingdom postage free.

WEDLAKE'S NEW HAY-MAKER, only 10l. 10s. 6d., cash in advance. Wedlake's New Horse Hay Rake, cash in advance, 3l. 15s. 6d. Book on Making Hay Cheap, 1s. Book on Feeding Horses Cheap, 1s. List of 260 Cuts of Machines, 1s.—118, Fenchurch Street, City.

The Agricultural Gazette.

SATURDAY, JUNE 9, 1855.

MEETINGS FOR THE ENSUING WEEK.
WEDNESDAY, June 13—Agricultural Society of England.

WE direct the attention of our readers to the notice in another page of the Great Cattle Show at Paris.

Agriculture is not yet, nor will it ultimately be so fully illustrated in the Great French Exhibition as it was in our own Crystal Palace of 1851. The long supplementary gallery by the northern bank of the Seine has however its eastern end devoted to machines and products of the farm; and, thanks to English agricultural mechanists, it has, already placed, a well arranged series of specimens of farm implements and machinery—the only sign indeed of anything like completeness in the building. To Messrs. GARRETT, HORNSBY, CLAYTON, CLAYTON and SHUTTLEWORTH, HOWARD, RANSOME, and several other well-known names, we are indebted for this representation of a branch of industry now so important. We noticed, too, specimens of seeds and plants partly arranged in their cases by VILMORIN, and other seedsmen of Paris, and the only other suite of specimens in place are importations from Canada, which has sent a series of casks full of grain and seeds and flour. An immense number of chests lying still unpacked, and labelled as from different districts of France, indicate that an exhibition technically interesting to the agriculturist will yet make its appearance.

No true lover of the Soil can help wishing for the day when the interesting topics it hides within its bosom shall have become more common property, and more capable of common speech. None but the pedant or the sciolist can find pleasure, or indeed anything but pain, in talking over the heads of his audience, or in carrying on a discussion in language unfamiliar to a large proportion of those who should be not listeners only, but earnest partakers in the question. That a great, though gradual, change is stealing over the agriculture of this country in this particular, scarcely any one who has had long opportunities of observation will deny. The number is vastly increased, within the last 10 or 15 years, of those to whom the toil and tedium of

farming business are varied if not relieved by a livelier insight into the why and wherefore of things, and an awakening interest in the inner history and philosophy of the art. Still it is slow; slow to the eye that counts with eagerness years that roll with speed, and indulges the ever too sanguine expectation of seeing Discovery and its Consequence so far at least contemporaneous in generation, as parent and child walking hand in hand, and not separated by a gulf too broad for prescience to see across, or for hope to span.

Never was there a moment when a little, and even a very little cultivation of the chemistry of farming would be more pleasantly and amply rewarded than the present: for, never was a subject of more everyday interest to the practical man handled in the lists of science, or between champions better qualified for the task, than in the controversy now waging and at its height between—let us say England and Germany. Not at Vienna or Berlin! Thank Heaven for that. No world-shaming Christian slaughter roars and howls out o'doors a running accompaniment of blood and broken bones to the 'polite pauses' of our 'Conference.' The nitrates and sulphates we talk of don't mean Gunpowder, nor do our hottest disputes involve any such extra-super-phosphate as that which saturates the soil of the Crimean peninsula. Some sharp phrases and stinging words, there be; just enough to make men of science stare, and wonder, and rouse themselves to the recollection that it is war-time; but the chemistry of our profession with all its heat and transmutations keeps no laboratory for the manufacture of fatherless children and widows, and in the trenches it digs and defends, and the ground it gains from the foe, not even a tear bedews the furrow.

So, hoping for quieter times, let us return to the 'soil and the atmosphere,' and to the particular question on the nutrition of plants which has called forth, and is still calling forth such brisk reply and rejoinder between the advocate and the opponent of the 'so-called' (and, as far as we can see, properly so-called) "Mineral Theory."

We shall attempt, at all risk of apparent inadequacy of language, to reduce this question to its very simplest terms, to disrobe it down to its commonest dress; a fate that surely enough awaits it, as it becomes more talked of, and better known; and which, if it be true that contraries beget each other, no question ever better deserved; darkened as it has been by an involution and prolixity of language, that might be almost intended to hide all meaning from the common world.

Certainly to those who read the first translation of the Works of Baron Liebig that appeared in this country, the doctrine of that distinguished writer appeared to be plainly and distinctively this: that the analysis of the *ashes* of a plant, disclosing as they do its *mineral* constituents, afforded the formula, so to speak, of its specific *manure:* that in these lay as it were the skeleton of its structure, its earthy and earth-derived part. That the organic portion of its composition, obtained *chiefly* from the carbonic acid and ammonia of the atmosphere, and returned thereto by combustion, not being limited in quantity as the mineral constituents are, by the nature of the soil, but existing within reach of the roots and the leaves of the plant, and to the latter in unlimited amount; the conclusion plainly deduced was that the restoration to the soil of the *mineral constituents* carried off by the crop was the true aim and object of manure; and that every addition of *these* enabled the plant to take up a proportionately larger dose of organic food, and in a shorter space of time; thus answering in every way the special object of the farmer.

In the case of Wheat, for instance, the phosphates, sulphates, silicate of potash, and other mineral elements of its structure, in grain and straw, would be, according to this principle, the proper components of its specific manure: and so of every other plant in like manner. It was not said that additional supplies of ammonia and carbonic acid to those obtainable from natural sources, would be useless or inoperative, but that their appropriation by the plant would entirely depend upon the degree in which the *mineral* elements were available in equivalent proportion in the soil. So that in fact, doses of the former class (such as ammoniacal salts, for instance) were to be regarded as 'stimulant' or 'flogging' applications, taking up or exhausting the mineral 'equivalents,' and so far as these should be deficient, or not available, remaining as mere surplusage, unproductive of any addition to the crop.

This we believe to be a not unfair, though it may be a very inadequate statement of the mineral theory, as conveyed in Liebig's former works; nor can we gather any material qualification or variation of it from the volume lately published in answer to Mr. Lawes.

It will be in the memory of many of our readers that this 'Theory' had a sort of counter-reflection out-of-doors in public opinion for several years. Farmers of the elderly school, on the one hand, denounced the newly-introduced 'artificial' manures as 'mere stimulants,' 'exhausters of the soil'; and distrusted the use of dressings that yielded up all their virtue to a single crop; while authorities of the more scientific school were advising the application of guano (then regarded, erroneously enough, as the type of the 'artificials') to the Turnip-crop, and not to the cereals.

The experiments carried on at Rothamsted, and the doctrine deduced from them by Mr. Lawes, led him to conclusions very different from those on which Baron Liebig's theory had been constructed, and which had been carried into trial upon a sand-pit at Giessen. "Previous experiments, which I had made in my garden in the town," says Liebig, "had yielded no result. This induced me to purchase the land alluded to, a Sand-pit to the east of the town, which I found to surpass all others, in its nearly complete barrenness for the ordinary cultivated crops. I do not believe that, in a whole year, there grew naturally on the whole ten acres as much Grass or other fodder as would have sufficied for a single sheep. The land, therefore, was of the quality adapted to *the object I had in view.*"

We fear this would be an inauspicious opening of the Baron's case before a jury of English farmers. But it is impossible to pass over *ground* so important to the question at issue as that on which the experiments are respectively tried, on both sides.

What *was* the 'object in view'? Was it to prove that the mineral constituents of plants were the *first* essential of their growth upon an area (a *soil* you cannot say) *entirely* barren of them? If so the spot was well chosen. *e. g.*—To prove that the mineral parts of their structure, and not the ammoniacal and carbonaceous, are the proper *manure* of plants, take a piece of ground in which the former are totally wanting, and where the atmosphere will supply the latter!

But, surely, this was *not* the object. What agriculture wanted to know was whether in an ordinarily constituted soil, poor,—not by original denial of everything but "sand and quartz pebbles," but by the common infirmity of over-cropping,—the growth of cereal crops, whose scanty foliage derives less than others from the atmosphere, would be best promoted by mineral, or by nitrogenous applications to their roots.

Now, on this question, Baron Liebig furnishes us in his last work (p. 55) with the following condensed statement of his meaning, viz., "*that ammoniacal salts alone have no effect;* that, in order to be efficacious, they must be accompanied by the mineral constituents, and that *the effect is then proportional to the supply—not of ammonia, but of the mineral substances.*"

In the following page we have the counter-statement (given by Liebig) of the conclusion drawn by Mr. Lawes from his experiments on Wheat as follows.

1. *That the* mineral *constituents of Wheat cannot by themselves increase the fertility of land.*

2. *That the produce, in grain and straw, is rather proportional to the supply of* ammonia.

This is a clear issue. Now let us look at the land on which Mr. Lawes' experiments were made.

A field of 14 acres was divided into equal portions, of which one was without any manure whatever: one manured annually with 14 tons of stable-dung; the rest with different artificial manures, in various mixtures, viz., bone earth, bones with sulphuric acid, phosphate of magnesia, phosphate of soda, phosphate of potash, silicate of potash, and 'Liebig's mineral manure.'

The result of *seven years' experiments* was, that the lot manured with stable-dung yielded one half more than the unmanured lot; which, however, produced as much as either of those with the artificial (mineral) manures, except that which had 'Liebig's manure,' on which there was an increase of about 3 bushels of grain and 2 cwt. of straw; "a result," says Liebig, "which Mr. Lawes is inclined to ascribe to *the presence of a small quantity of ammonia in this manure, which he says he distinctly perceived by its smell.*"

Probably, Baron Liebig, not being himself the manufacturer, was not in a position to contradict this, from personal knowledge. It is *not* contradicted; and it is important. For ourselves meanwhile, we perfectly believe the tale told by the sand-pit at Giessen and have entire faith in the seven-years' chronicle of the fourteen-acre-piece at Rothamsted; and we hope, shortly, to exemplify, with their help, the logical warning, that 'there is a wide difference between *Contraries*, and *Contradictories.*' *H.*

EXPERIENCES IN LAND DRAINAGE.

No. XIV.—Result satisfactory, with some trifling exceptions, where much oxide of iron exists.—Parallel drainage generally, but following as much as practicable the declination of land.—Four feet (min.) depth.—Drains on Grass lands a little further apart.—With the fall; land laid as flat as possible, removing ridge and furrow.—Full-sized 2-inch pipes used for minor drains, $1\frac{3}{4}$ to 8-inch mains; collars in bog and unsound ground.—I have not kept air vents permanently open, but pits uncovered for months.—Perhaps 12 acres run out at one outfall, but this is altogether dependent on shape of ground, allowing more than an inch for outlet.—Soil—clay, gravel and peat, clay and gravel.—Rock basaltic and limestone; Newbrough lime and freestone. Height 450 feet; Newbrough is 350 feet (or thereabouts).—Rainfall 25 to 30 inches; Newbrough 20 inches.—I have had some very difficult drainage to execute on bog lands, but have fully succeeded by dint of care and time; proceeding step by step, allowing months to elapse between each successive "spading." In some instances there has been an average fall of surface of 3 or 4 feet on an extent of 30 or 40 acres; and in spots where the level has subsided into "basins" (the great danger to be apprehended and guarded against in rapid execution of similar works), has been much greater; on one considerable portion the drains were bled off, and kept open upwards of a year; on another double that time before they could be safely laid and closed. Two to 6-foot drains were, at 50 yards apart, quite effective, when the peat was black and fully decomposed. When the bog consists of partially decayed Mosses, &c. (which I have found to be the case to the depth of 3 or 4 feet), it is more difficult and expensive to cut than stiff and stony clay and gravel, and "draws" very badly; of course collars were used even with 4-inch pipes. It would be a great advantage were the Drainage Commissioners empowered to authorise limeing and soiling bogs. The only serious difficulty I have experienced in draining operations, is dealing with water charged with oxide of iron; I have known 3-inch pipes to be choked in one year by it, and this where there was a considerable flow of water. Where much lime is held in solution, it will sooner or later ruin the drain. In one instance I found pipes laid in open gravel stopped at the end of 3 years by small fibrous roots, in meadow land, depth 4 feet; no collars. After some years' experience I have no doubt as to the comparative inutility of shallow draining, and the great advantage, in the most tenacious clays, of at least a depth of 4 feet. *Gustavus H. Coulson, Newborough, Northumberland.*

No. XV.—I have the singular privilege, in reporting on the result of my drainage operations here, of being able to preface my own statements by a report from a high authority on the chemical and structural condition of the soil in which these operations have been effected, as it lay previous to their commencement. A specimen of the soil and subsoil having been submitted, in the year 1845, to Professor Johnston, he furnished the following analysis, appending thereto some valuable remarks and instructions (partially quoted below) which have been of much service in directing the processes of culture and management followed out.

Analysis of Trawig.	Soil.	Subsoil.
By Washing—Clay, fine sand, and organic matter	93.07	97.12
" Coarse sand and small stones ...	6.93	2.88
	10.10	2.44
By Analysis—Organic matter	0.91	0.15
" Alkaline salts soluble in water ...	0.19	trace.
" Gypsum, sulphate of lime	3.22	3.79
" Oxide of iron	2.13	2.61
" Alumina, soluble in acids	1.22	0.67
" Carbonate of lime	0.87	0.51
" Carbonate of magnesia	81.17	90.25
" Insoluble silicious matter		
	100.01	99.92

Remarks.—It is a stiff clay, formed, as your geological position would intimate, from the *debris* of the mica slate rocks, with a little assistance from the granite and from the old red sandstone. The proportion of oxide of iron, derived chiefly from the latter, is not excessive; and in a proper condition of the soil, properly drained, thoroughly opened and well tilled, would add to its productive character; but I observe that this oxide has formed itself into little red lumps indicating an unwholesome condition of the soil, that the air is not properly admitted, and that there exist among the soil particles of ochrey matter with which it will not be wholesome for the roots of plants to come in contact. The small quantity of organic matter in the subsoil would seem to imply that it has hitherto been in a condition in which very few roots would willingly descend into it. These facts all recommend thorough drainage and subsoiling as necessary to render available to the plant the different kinds of food which the soil so abundantly contains."

These remarks were written in July 1845. Perhaps their accuracy could not be better supported than by the simple statement that the Wheat crop of the outgoing tenant of that year was estimated by valuators at $14\frac{1}{2}$ bushels per acre, an estimate which was somewhat in excess of the produce actually harvested by me, the incoming tenant. The whole farm has been thoroughly drained, and the effects are eminently satisfactory, the produce being now in the aggregate fully three-fold of what it was prior to draining and deep tillage, though the ochrey matter which the learned Professor described as "not wholesome for the roots of plants to come in contact with," is not yet quite washed out or neutralised, hence the produce of Wheat and Oats disappoints expectation, while green crops are satisfactory.

Before entering on a brief description of the methods of draining adopted, I must advert to the rapidity with which agricultural improvement has developed itself. To many it will seem strange to see it stated that 10 years ago a pipe tile was a thing unknown and unthought of. Smith of Deanston's system of furrow draining was then beginning to be accepted by the more advanced agriculturists as a proved and practicable improvement; and his plan of 2½ feet drains, filled from a fork with broken stones, was the *ne plus ultra* of drainage engineering. Such was the system followed in the major part of the drainage I effected. My first change was to 3 feet deep, with 8 inches of broken stones; then came tiles with boards below for soles, and broken stones above. It was in 1848 that I put down the first pipe tiles, 3 feet in depth. Increasing that depth to 3½ feet, and placing 1½-inch pipe drains in the line of descent, at intervals of 8 yards, we attain to what may well and truly be termed "thorough drainage."

Drainage on each of these systems has, I must say, been efficacious, whatever preference I may give to one system over another. No water, even after heavy rain, lies for above a few hours on the least perfectly drained field. It is true that the run through stone drains is not so rapid as it is through tiles; that, therefore, the dissolving power of the percolating water is less active, but though this is a deficit in soils like mine containing deleterious substances, in a soil free from these and full of manure the slow percolation is advantageous, inasmuch as it carries off less of the fertilising substances. Those who have observed the results obtained by Mr. Hope, of Fenton Barns, which are largest from land drained on what the enthusiasts for deep draining would consider very faulty principles, are cautious about trying to "make good better" by going again over their drained ground; therefore I am content to allow my land, stone-drained at 2½ and 3 feet depth, to lie as it is. Pipe tiles I have uniformly used without collars; and I see no reason for their use. Having last year occasion to open a conduit through a field drained with pipes in 1848 (and these pipes of very indifferent make, the manufacture being then a novel one), I cut through many drains, and found no tendency to silt up with sand, though the "subsoil when dry was found to crumble into a state of very fine powder, containing an admixture of very fine quartz sand partially rounded and mixed with abundant scales of mica" (Professor Johnston's Report). I must say that collars appear to me a totally useless expense and complication of work. Having quarries of red sandstone in my immediate neighbourhood, the rubbish stones in which I had for the carting away, all my conduits and outfalls have been built with them. These vary from 6 inches broad by 9 inches high, to 9 inches broad by 12 inches high, and through a conduit of this last size I would not hesitate to conduct the drainage of 100 acres, provided there were a good outfall. The labour of opening, building, and filling in such conduits is paid for at less than 6*d.* per yard, a sum below the simple cost of pipes of much less capacity. This is a point worthy of the consideration of those having somewhat of the same advantages in proximity to stones. It is true that the cartage of such is a considerable item, if paid for, but when done by the horses of the farm, it is not more felt than the cartage of tiles from a not very distant work. Moreover, danger from breaking and consequent sinking in, which in pipes of large dimensions is considerable, is, by this plan, all but entirely guarded against; and this is an object well worth some extra labour. I have not made vent holes to give a circulation of air through the drains; indeed, with stone-built conduits, such as I have described, the covers of which at frequent hollows come within 2 feet of the surface soil, I am satisfied that a circulation of air takes place without this assistance. *Alex. Simpson, Teawig Farm, Inverness-shire.*

Home Correspondence.

Adulterated Guanos.—The shameless frauds practised by some dealers have been long known and exposed, but how are such to be detected by practical farmers, who are not chemists, and yet want a supply just at a time when a dealer is at hand and ready to sell? A case of this kind came under my knowledge some time since, when the sale and terms of purchase had been settled between the parties. It was then understood that the money was to be paid on the day following (10*l.* per ton); I therefore had little enough time to effect even a slight quantitative analysis. The sample I received was about four ounces. Having been accustomed to experimentalise with several varieties, it occurred to me that, by a few simple processes, it would be possible to attain to a pretty correct idea of the moisture contained in a given weight (which ought not to exceed 10 to 12 per cent.) of the quantity of ammonia in the soluble salts, of the insoluble matters, the most valuable of which is the bone phosphate, in its state of extremely minute division. I now, therefore, endeavour to recite, in the most simple terms, the processes adopted by me, and which I now venture to recommend to those who have not at command a more refined analysis:—50 grains of the sample to be examined are dried in a paper, placed upon the hob of a grate, then weighed to ascertain the loss of water, and rubbed in a small mortar to a fine powder; two-thirds of the quantity (say 36 grains) of fresh air-slaked lime are, in like manner, placed on the hob of the grate, and equally dried and weighed, and both are then triturated together. The weight being accurately noted, they are transferred to a small balanced saucer, moistened with a dessert spoonful of rain water, and stirred with a pointed quill. Ammoniacal gas is immediately developed, but in much greater volume when placed upon the warm grate till dry. The mixture is then to be treated with boiling water sufficient to bring it to a paste, stirred repeatedly, and left in heat till dust dry, when the volatile ammonia will have been totally expelled by the lime. The loss of weight will be found to vary according to the quality of the guano. In one experiment made by me it was proved that a mixture of 50 grains of dry guano, and only 26 of lime = 76 grains, so treated, had lost 6½ grains. This loss, if assigned to ammonia only, would indicate 13 grains in the 100 of the ammonia actually existing as a base to some or all of those acids which are found in the soluble ingredients of pure and sound guano. If by repeated experiments of the kind, with different samples, certain definite quantities are left, and the loss of weight ascertained, a pretty correct idea of the actual quantity of potential ammonia will be attained, sufficient, at all events, to guide the judgment of a discerning practical agriculturist. Professors Anderson and Way concur in the opinion that "there are only two constituents which practically require to be considered in the estimate of the commercial value of guano and the phosphates." This is admitted, for the phosphates which exist in some of the salts soluble in water contain ammonia. Yet the one most available in Turnip culture is the bone earth (phosphate of lime), which remains in the insoluble matters after water has taken up all that it can dissolve. These insoluble substances include more or less urate of ammonia—a valuable ingredient, but requiring time and accuracy for its development. Estimating it at 12 per cent., and the bone phosphate at 23 per cent.; also other organic and saline matters at 16 per cent., with 2 or 3 per cent. of sand in all; 47 per cent. may be taken (including from 6 to 10 parts of moisture) as the mean average of all the ingredients soluble in rain or distilled water. *John Towers, Croydon, May* 10.

Gas Water as a Manure for Grass Lands.—I have this year seen at the rate of 10 tons per acre of gas water applied against 20 tons of good rotten dung. I was surprised to see it on April 3d, the Grass where the water was applied having a fine green and grassy appearance, and the other parts of the field as brown as when the dung was put on. I have also seen gas lime used at the rate of 5 cwt. per acre with great advantage. *R. Gilbert, Haxby.*

Mangold Wurzel.—I forked up and left in ridges during the winter some land where I intended to plant some Mangold Wurzel; put on the land a good dressing of farm-yard manure, and at the end of April planted it with Mangold seed by dibbling it in. Here and there patches of the seed have come up, but very weakly, and on using my knife in places where no plants appear, but where the seed was sown, I have found worms, some of them in the seed and the seed generally eaten through. I send you two of these worms. Can you tell me their names, whence they arise, and acquaintance with a suitable preparation in which to steep the seed for the future, so as to prevent their ravages? I propose to sow again those portions where no plants have come up, first of all using guano, then covering the guano with a little of the soil, and soaking the seed in water, so as to expedite the growth of the plant and recover lost time. *G. P.* [We did not receive the specimens sent. Soak the seed in dilute liquid manure so as to hasten its growth.]

The Wheat Plant.—From various parts of England and Scotland have been reported the loss of Wheat plants from effects of the late excessive frosts and droughts, inasmuch as hundreds of acres have been ploughed up as not worth standing. Judging from similar cases in our own neighbourhood, such alarms and proceedings may have been out of place. Many in this district, who have here and there on arable land lost some half or three-fourths of their plants from frost, drought, wireworms, maggots, &c., and who have had recourse to sowing afresh or ploughing the rest up, will no doubt have cause at the fall of summer to repent of their folly in not first rolling it with a heavy roller, and turning on to it a flock of sheep for a day or two, and then keeping it perfectly clean, thus securing the chance of getting some 5 or 6 quarters per acre. It may appear an anomaly, but the very circumstance last season, 1854, of the universality of lost or thin plants of Wheat, occasioned from extraordinary wet, &c., was without doubt the chief cause of so unusual an abundant crop; for in many other respects it had to fight through various unusual vicissitudes never before heard of, and, on the whole, was not expected to prove a good Wheat year. We allude to the circumstances of violent storms, blights, fungus and rust in the blade, and other strange atmospheric visitations, together with more abortive ears than in ordinary seasons. So far as appearances go, to inexperienced persons, at the present time the magnificence, luxuriance, fulness of the plants, and verdure of Wheat generally in this district, present themselves much more favourably than in the corresponding month of May, 1854, and augur well so far for a more abundant yield. But all is not gold that glitters, and we cannot forbear to remark that no such productions as last year can be reasonably expected from the very unusual and extravagant full crops which now appear; on the contrary, we must indulge our confidence that such as those which are called partial or misplants will in the fall of summer prove very far in advance, provided that such thin crops are kept clear of weeds. In confirmation of the folly of sowing too much seed, we respectfully invite to the notice of our agricultural friends our present crop of Wheat, growing on common ploughed land, planted at the extremely small quantity of from 6 to 8 pints per acre, which we venture to back against anybody else's full plants from 128 pints, or above 20 times the quantity. *Hardy & Sons, Seed-growers.*

Societies.

THE GREAT CATTLE SHOW AT PARIS.

France is proving that she is as capable as ourselves of directing attention to the arts of War and Peace at the same time. Her great Palais de l'Industrie, which is gradually becoming filled with her own handiwork and that of other nations, is not the only proof of this; an even more direct conversion of the sword into the ploughshare is seen in the allotment of a portion of the Champ de Mars for the purpose of a cattle show. A large collection of animals (very fully illustrative of our own breeds of cattle and sheep and pigs, and those of France, Holland, and Switzerland) is here gathered together. The scheme is admirably adapted for usefulness, especially, we think, to agriculturists of France, as our own breeds certainly approach the nearest to the ideal of form on which all are agreed as the proper goal for which to strive, but also to English visitors, most of whom must have been surprised at the distinctness and uniformity of character possessed by many of the French breeds of cattle. There was certainly nothing for us to learn in the pigs exhibited by Frenchmen—coarse, ill-formed, ugly specimens, such as might have been seen half a century ago with us, were alone exhibited in the native classes. And the English breeds, though furnishing many good animals, were far from being so satisfactorily represented as they are at Birmingham or Leeds. Mr. Williams, Mr. Northey, and H. R. H. Prince Albert are among the prize holders in this class.

Our sheep were fairly represented: four classes were exhibited,—1, Merinoes; 2, Long-wools, including Leicesters, Romney Marsh, &c.; 3, the Dutch races—also long-woolled, along with which were placed the Cotswold sheep; and 4, South Downs.

There were a great many pens of Merinoes of so very even a character that they had quite the appearance of one flock, but they came from widely distant parts, and thus proved the very uniform and definite character of the breed. The 2d class was due almost wholly to English exhibitors, among whom were the names of Kingdon, Radmore, Creswell, Watkins, Ashley, and George Turner. The 1st prize for young rams was awarded to Mr. Kingdon, of Thorverton, Devonshire; the 2d to Mr. Creswell, of Raventon, Leicestershire; the 3d to Mr. Radmore, of Thorverton, Devonshire. There were 22 animals exhibited. For old rams, of which 24 were shown, the 1st prize went to Mr. Watkins, the 2d to Mr. Creswell, the 3d to Mr. Turner. For pens of three sheep Mr. Turner, Mr. Watkins, and the Vicomte de Curzay carried off the prizes, the last as well as the others being English sheep. Among other long-woolled sheep, Mr. Beale Browne and Mr. Ruck, near Cricklade, carried off the prizes with young Cotswold rams; Mr. Handy and Mr. B. Browne with old Cotswold rams; Mr. B. Browne, Mr. Burgess, and Mr. Ruck with pens of Cotswold, Romney Marsh, and Cotswold sheep. Of the 83 pens of sheep in these two classes 68 were from England, and all the prizes, except one, and that was for sheep imported from Worcestershire, have also come to us. There is a very good show of South Downs, as there always must be when such men as Messrs. Jonas Webb, Rigdon, and Ellman choose to exhibit. Six young rams are shown by Mr. Webb, to whom was awarded the first prize in that class, while M. Bella, of Grignon, took the second with a ram, also imported from Worcestershire. The first prize was not awarded according to English judgment—other sheep of Mr. Webb's lot being considered superior to the one which received the prize—the aim of the French breeder is somewhat different from that of the English, and their opinions of merit thus do not agree. For old rams the first prize was awarded to Mr. Rigdon; the second to M. Allier, père, for sheep of Mr. Jonas Webb's breeding. The pens of three sheep in this class were all exhibited by foreigners, the first prize being, however, awarded to sheep of Mr. Webb's breeding.

The show of sheep is eclipsed by that of cattle, which is especially interesting to English visitors from the very complete and satisfactory illustration it affords of the native breeds of France. The first section, however, relating to foreign breeds, is extremely interesting, and very well represented also. In it are, of course, included the Short-horns, Herefords, Devons and Sussex, Ayrshire, and other dairy breeds; together with the Dutch and Swiss breeds. Among our own breeds most of the prizes are, of course, carried off by Englishmen, though foreign breeders have been successful to some extent with all excepting the Devons. In Short-horns the young bulls were all English but one, the first prize being awarded to the Marquis de Talhouet, for an animal of Mr. Richard Stratton's breeding, Mr. Marjoribanks carrying off the second, and the third being awarded to Mr. Botton-Levêgues, for an animal of Mr. Towneley's breeding. Among the old bulls the prizes were awarded to Lords Feversham and Talbot, Messrs. Crisp and Stratton, and H. R. H. Prince Albert—the first to Lord Feversham for a red and white bull, bred by Lord Ducie (by Duke of Gloster out of Beatrice), and bought by his Lordship at the Tortworth sale.

He is a very fine specimen of the short-horn race—the finest specimen of the genus Bos, we heard it stated, ever shown in France, and well worthy of his high rank in this great national exhibition. For heifers of the short-horn breed, the prizes were awarded to Captain Ball, le Comte d'Aspiemont (for an English heifer), and H.R.H. Prince Albert; and for cows, to Mr. Stratton, Captain Ball, le Marquis de Talhouet (for a cow of Mr. Stratton's breeding), and Mr. Cartwright. The Hereford breed is remarkably well represented; as fine a lot of animals being shown here as will be, we doubt not, at Carlisle next July. Lord Berwick takes the first prize with a remarkably well made large bull; Mr. Price is second, and M. le Vicomte de Curzay is third, with a bull of Mr. Yeoman's breeding (Stratton House, Herefordshire). Messrs. Perry and Walker, of Leominster, take the prizes for Cows. The Devon and Sussex breeds are shown in a class together, and Mr. Turner, Mr. Farthing, and H.R.H. Prince Albert take the prizes, all with Devon animals. The Ayrshire cattle are not very well represented, neither are the Scotch, Alderneys, &c., shown along with them. The first prize among bulls is given to Lord Talbot for a large polled Angus bull, and the second to a small Ayrshire; the prizes for cows and heifers are all given to Ayrshire cattle.

And now we come to the breeds of Holland, Switzerland, and France, which must be characterised generally, without any special reference to the prize animals, in which our readers are not likely to be interested. The Dutch breed is chiefly useful as dairy stock—they are large coarse animals, of black and white colour, with tight skins, handling very hard, and anything but attractive to those who have Short-horns, Herefords, and Devons to draw from; nevertheless importations have, we understand, been made by Irish breeders—not, we imagine, with any probability of improving the native stock. Two classes of Swiss cattle were exhibited, the one chiefly from Canton Berne, the other described as of the Schwitz race, both large and generally well-made animals, the former chiefly red or black and white, the latter of a dun or mouse colour of various shades, both very well made and good dairy breeds. Their *entrée* on Friday of last week decorated (both to eye and ear) with the large bells that are part of their constant dress at home, must have been something remarkable. Upwards of 80 animals of these two breeds are shown, and their Swiss attendants and owners, fine, tall, well-made men, with intelligent thoughtful faces, reminding one of the men one meets on market days in country towns of Scotland, were as striking a feature of the gathering as the cattle they have brought. These large animals—such large-framed heavy cattle—are the breeds characteristic of the mountain districts of Switzerland!

Among the French races represented in the Champ de Mars are, (1) the Normandy, a large, coarse, parti-coloured breed, chiefly dark brindled brown and dun. (2.) The Flemish, chiefly red, dark red, and red and white, reminding one in form of short-horn cows, and in colour frequently of the Herefords or more often of the Devons and the Sussex; they are a large and useful dairy race. (3.) The Charolaise, a pure white breed of great beauty and remarkable symmetry: many among the bulls exhibited would have passed for very decent shorthorns, and French agriculture need not depend upon imported blood for improvement, having the excellent stock of this race as the groundwork of a breed which may become as good as any we possess. (4.) The Garonnaise, a light dun-coloured breed of remarkable uniformity of character, some of which, with their remarkable horns, are imported for sale at Smithfield. (5.) The Comtoise, chiefly white, a well formed breed of moderate size; and—besides other classes from the mountain districts of France—(6.) the little black and white breed of Brittany, reminding one exactly of our own small breed of the Shetland Islands. Almost all of these races are shown in considerable numbers. Besides these classes there is one for short-horns of French breeding, in which, however, the race is not as well represented as it is in the English specimens shown. The cattle classes include not fewer than 643 entries, and have well justified the interest excited by them. One very interesting feature of the exhibition is the number of cattle shown by the Emperor and by the National School of Agriculture. His Majesty does not enter into competition with his subjects—his cattle are shown in a class by themselves; and among them are some good Ayrshires, Short-horns, and cross-bred stock—the result of experiments between the native breeds and our own Devons, Durhams, Ayrshires, &c.

The show of poultry includes many very fine kinds, but is not equal to what we have in England, either in the merit of individual specimens or still more in the classification and arrangement of them, which would have made the work of comparison easy to the visitor.

As a whole we should imagine that the result of the prize list offered by the French Government will be considered satisfactory by the promoters of this movement. The animals exhibited must be a useful lesson to the agriculturists of France and of the other countries from which their visitors and exhibitors have come. It is to be regretted that a larger number have not availed themselves of the opportunity of examining so varied a collection. The English visitors are not so numerous as might have been expected, and the whole are far from equalling in number those that flock to the annual gatherings of our own national societies. A larger number availed themselves of the free admission given on the Wednesday, and the pavilion in which the prizes were distributed to exhibitors by the Minister of Agriculture was crowded with spectators.

Farmers' Clubs.

London: *Economy and Cost of Good Roads.*—This was the subject of a lecture last Monday evening by Mr. J. Bailey Denton, of Stevenage. After a few words of introduction from the chairman,

Mr. Denton said,—I believe, with the late Sir Robert Peel, that true economy in road management consists in that combination of care and judgment which shall ensure the best result from the least comparative outlay, without any other consideration whatever; but as superiority in result is only one element in that combination, and as the occupiers of land (that class especially represented by this Club) are by far the largest contributors towards the cost and maintenance of roads, it becomes quite as much our duty to check ill-advised expenditure in all its details as it is the object of the general public to have good roads at any price. Perhaps nothing could more appositely preface our discussion than the definition of what a perfect road is, as it will enable us to comprehend how far from perfect our roads still are, though so vastly superior to what they were 50 years ago, and how susceptible they are of further improvement. "A road, to be theoretically perfect," says Dr. Lardner, "should be—first, perfectly straight; second, perfectly level; third, perfectly smooth; and fourth, perfectly hard. If it possessed all these qualities in absolute perfection, the consequence would be that it would require no tractive power at all—an impulse given to a load at one end would carry it to the other by its inertia alone. This is the ideal limit to which it is the business of a road maker to approximate as nearly as he can, all practical circumstances being considered." But the doctor further observes "that it is obviously impracticable to make roads in the country which would be perfect; there arises in most cases the extremely difficult inquiry as to the best possible compromise which can be made between all the inevitable imperfections, the existence of which we are forced to admit."—See evidence before Committee of the House of Commons, 1836. Now, although this definition will serve the good purpose of showing us our defects, it is not my intention to rest upon anything that savours of theoretical and impracticable perfection, but to proceed with the subject in that way which shall most pointedly and in the shortest manner bring us to a true understanding of our own position as tenant farmers, who are not only maintaining for the most part the public thoroughfares of the country, but are necessarily obliged to maintain the private or farm roads within our own occupations, where we are fortunate enough to possess them. In the first place we will have regard to the turnpike and parish roads—those roads which are called "public," and are supported by tolls and rates; and in the next place, we will refer to those roads which afford internal accommodation to farms, which are called "private," and which are solely maintained by those who possess them. When treating of public roads, the question of their economy and cost has reference to their maintenance, rather than to their formation, and to this view of them we must confine ourselves on this occasion. It is in consequence of the vast change that has recently taken place in the system of our national intercommunication that the consideration of the matter should not be delayed. Railways are in fact fast superseding or detracting from the use of the principal coach roads, and we shall therefore be better employed in considering their future support and management than in discussing any improved means of making new ones, particularly as we find by every day's experience that the more railways are extended and appreciated, fresh lines of existing highways are opened up radiating to the numerous railway stations, by which neglected parish roads are brought into use and their imperfect character brought to light. The effect of this vast change is becoming gradually known to us all in one way or another. If we are trustees and bondholders of turnpike roads, we know it by the insolvent condition of our trusts, although the annual expenditure on turnpike-roads has been reduced in eight years to an extent of more than 400,000*l.* per annum. As rate-payers we know it by the increased amount of the highway rates, which, in the same period of eight years, have increased above 600,000*l.* per annum, with the outlay disproportionately increased in those particular parishes lying nearer the railway stations, and through which the traffic from the more distant must pass without contributing to that extra cost; and, as part of the general public, we know it by the total neglect of those roads which have had their traffic diverted, and by the unequal condition and the absence of judicious control of the roads generally. Of course there is no rule without an exception, and districts may exist where turnpike trusts are still thrifty, and where uniform good management by parochial authorities is prevalent, but I think there is no one here present who has failed to observe the ill consequences accumulating throughout the country from the bankrupt state of turnpike trusts through the neglect of irresponsible trustees, and from the fact that parish roads still remain under the control of unpaid and unpractised surveyors serving only for a single year. With respect to such roads, we have all I dare say, had some experience, and I am not misrepresenting the fact, when I say that there are not a few who have felt the necessity of acting as surveyor of highways in our several parishes, as a means of self-preservation, as a means in fact of remedying the omissions of preceding surveyors who may, perhaps, have been more liberal near their own occupations than ours. I will freely confess that it was the total neglect of the roads in that part of the parish in which I resided that induced me a few years back to seek the office, and then I did not fail to make the best use of the opportunity to give the neglected roads a dressing which I believe my successors have considered so abundant that they have done nothing to them ever since. But leaving individual cases out of consideration, we must all acknowledge that unpaid services are generally of little value, and that no man whose income depends upon a profitable use of his time ought to be called upon to devote a part of that time to periodical business without compensation, and further if we examine the matter attentively, we shall find that the knowledge and application essential to a good management and economical maintenance of roads is comparatively rare. It is too frequently believed that any parishioner who can be trusted to collect and dispense the highway rates is qualified to act as stonewarden of his parish, and it is this unfortunate theory that trustworthiness is synonymous with knowledge, supported by erroneous notions of economy, that has led to the defeat of every measure which has been proposed for the improved management and union of public roads in districts. It may be true that a person may be a good manager of existing roads without being able to enter into such refined calculations, for instance, as the resistance of friction and collision of material, the force of gravity in impeding draught on roads at different gradients, and the amount of impediment arising from elasticity of formation. These, however, are elementary data indispensable to a good road maker, and though, perhaps not so necessary to a road manager, it is manifest that a knowledge of the whole subject in its various details must better qualify him for his duties than the possession of accidental information, acquired in the pursuit of another business. Under any circumstances we shall all agree that any one taking the management of our parish roads should at least appreciate the advantage of a perfect surface draining and under draining roads, and the benefit of sun and of air; the proper sectional formation for different roads according to circumstances of position; the relative value of materials in comparison with the cost of procuring them; the proper size of material by which to maintain the bottom stratum as well as the surface covering; the quantity to be applied to the best advantage at each dressing, and the best time of applying it; and particularly the economical application of labour in a broad engineering sense, not as meaning the crowding of men on the roads when it is not possible to find work for them on the farm:—these and such like practical considerations, we must all admit it is necessary a surveyor of the highways should be able to apply in all the details of his office. How few there are who at the present time undertake the duties possess even this essential knowledge, or if they possess it how few will give the necessary time to its profitable application! But as we have now arrived at the critical period when the trustees of turnpike roads are taxing the parishes through which they pass, under Sir Charles Burrell's act, to contribute to the roads they undertook to maintain, and when the whole traffic of the country is being changed from former channels to courses at right angles to them, I venture to hope the farmers of England will see it is time we changed the system of management also, that, in fact, we should look to our own interests as ratepayers, and abandon the unsatisfactory, and in the main costly, agency of paid surveyors and paid clerks to turnpike roads, and unpaid and annual parish surveyors of parish roads, and adopt the more consistent and, in the end, less costly machinery of consolidated authority. It will hardly be credited that although there are only 10,700 parishes in England and Wales, there are 15,841 distinct places levying highway rates, and that, although the turnpike roads are constantly less every year to maintain, the expenditure on highways, which in 1827 was 1,000,000*l.*, and in 1839 was 1,1[illegible] amounted in 1845 to 1,717,334*l.*, without any appreciable increase in length of the highways themselves; but all this is true, and it is to the expediency of consolidating these numerous jurisdictions into unions with an equalisation of expenditure that I hope you will address yourselves this evening. In the year 1850 Sir George Cornewall Lewis, now the Chancellor of the Exchequer, introduced a bill into the House of Commons having in view the union of parishes in districts and the concentration of the unpaid officers of parishes into one paid officer for each union. As you are aware it did not become a law simply, I presume, because the time was not then ripe for the acceptance by the country authorities of the principles distinguishing that measure. But five years have since elapsed and the country, as well as town, is rapidly acknowledging the union of extended management as the most effective and most economical system of management. I shall, therefore, not be outstepping the duties I have taken upon myself in this discussion in placing before you the scheme of Sir George Cornewall Lewis, with such additions as shall retain in the hands of the rate-payers certain powers of appeal and scrutiny, which, I would submit, it is desirable they should continue to hold. Under any circumstances, although there may be difference of opinion in details, it will serve to bring into comparison with the present divided and unsatisfactory mode of management the principles of union management. The main points of the scheme are these:—1st. The districts of road management shall be coextensive with the unions. 2d. That a competent surveyor of roads shall be appointed to each union, or to two or more unions, according to the extent of mileage of roads within such union. 3d. That directly any portion of the highway rates of a parish is applied to the maintenance of a turnpike road, that turnpike road shall be placed under the management of the surveyors of the union. 4th. That the surveyor shall be nominated by the board of guardians, and if approved (after examination of his qualification for the office) by a central board of examiners appointed by the Board of Trade, shall receive the appointment. The board of examiners will be similar in character to the official referees of the metropolis where the district surveyors for buildings undergo examination as I propose here. 5th. That there shall be a select committee of the board of guardians to be called the roads committee to whom all complaints of ratepayers, and all accounts respecting the roads shall be referred, whose decision on such complaints shall be binding on the surveyor, except in such instances as the surveyor may elect to appeal to the central board of examiners. 6th. That the salary of the surveyor shall be regulated by the mileage of, and duties upon the roads under his management. 7th. That such surveyor shall make half-yearly statements, showing the length and cost of maintaining each public highway within the several parishes distinguishing the cost of labour and materials, and such half-yearly statements shall be affixed to the church door in each parish within a month of the termination of each half-year for the inspection of the ratepayers. 8th. That such surveyor shall furnish the board of guardians with a complete annual statement of the total cost of the maintenance and management of the roads under his charge, together with an estimate of the works required for the next year, which having been audited as part of the accounts of the union, the clerk of the board of guardians shall reduce the whole into an abstract form, and forward it to the clerk of the peace of the county, in order that it may be published in the county newspapers and forwarded to the Board of Trade once in every year concurrently with the other unions throughout the country. This will enable all persons to compare the cost of management and maintenance of the several unions and will prevent jobbery. 9th. That the several abstracts so published shall be formally collected by the Board of Trade from the several unions throughout the country, and presented annually as a parliamentary paper to the House of Commons. These suggestions will be found to differ in some few particulars from the *modus operandi* set forth in Sir George Cornewall Lewis's bill, though the principles involved in both are the same. They have in view the constitution of an uniform system of management with such security on the score of competency that, as the several turnpike-trusts expire or turnpike-roads are thrown on parishes to support, we shall have in existence an executive conducting the maintenance of highways superior to, and much less costly than, the divided and responsible system which prevailed in the management of turnpike-roads in their most palmy days, and which had the effect even before railways robbed them of much of their incomes of gradually bringing the majority of those trusts into irrevocable debt. I have laid great stress upon the perfect competency of the surveyor, for although there should be in each union a road committee, so as to preserve the English principles of leaving local affairs to local management, still it will be found in practice that the real onus will rest with the surveyor who should be obliged to devote the whole of his time to the duties of his office, and you will have observed that I have suggested by an appeal to the road committee a summary mode of redress for inattention on the part of the surveyor. This is desirable in order to avoid the expenses of an indictment. It is estimated that a person fully understanding the business of road management may look after from 150 to 250 miles of roads of ordinary character, and that this latitude in figures will represent the roads with an area 10 miles square, containing 64,000 acres. There are in England and Wales 104,772 miles of highways and 57,805 square miles of country, so that we may see at once that there is not on an average a length of 2 miles of highway to a square mile of country. In Westmoreland there is hardly one mile of highway to a square mile of country, whereas in Devonshire there are nearly three miles to the same area. Competent persons are to be found who will undertake the duties for from 150*l.* to 200*l.* a year, to which, if 40*l.* were added for keep of a horse, the average salary would be raised to about 250*l.* This would be equal to about 1*l.* per mile of ordinary country roads; or, to place the matter tangibly before you, so that we may see how such a salary would affect our pockets as ratepayers, it is estimated that from ¾*d.* to 1*d.* in the pound would satisfy the salary of the surveyor under such an improved mode of management. We can each of us compare this with the salaries paid to and duties performed by surveyors of turnpike-trusts, and with those isolated instances where salaries are paid to stonewardens in parishes where payment is made for superintending the highways, and I think we shall admit that, looking forward to the time when turnpike roads will come under the management of the surveyors of roads in unions, and the expenses attending the present management

of such turnpike roads may be saved, there will be little or no loss in the item of salaries by the change of system. To make this may be well to state that there are nearly 1200 turnpike trusts in England and Wales, having a management of a length of between 23,000 and 24,000 miles, of which a considerable number do not receive sufficient in tolls to cover the cost of repairs, and pay the interests of their debts (which amount in the aggregate to about 7½ millions), and must sooner or later receive assistance from the highway rates, if they do not do so already. These bankrupt trusts, however, are still represented by paid surveyors, whose salaries have to be paid; and though those salaries have been reduced, the aggregate amount of what is still paid would go far towards the cost of road management in districts. The salaries paid to clerks and surveyors for the superintendence, law, printing, advertising, &c., amounted, I find, in 1834 to above 180,889*l.*, or 8*l.* per mile. Now, as there appears to be in England and Wales about 130,000 miles of public roads of all kinds, the amount paid to lawyers and road surveyors for the 23,000 miles of turnpike roads alone would under consolidation more than pay the salaries of all the surveyors required for the management of the 130,000 miles of public roads of all kinds, assuming that the estimate of 1d. per mile is sufficient payment to the surveyor, with 25 per cent. added for costs and expenses attending the machinery of concentration. You will observe that I have said little about the financial position of turnpike trusts; it is too difficult a subject to introduce into this discussion; I am content to assume that as soon as any turnpike trust applies for parochial relief it shall be treated as a pauper and sent to the union, by which the expense of management attending such trust will be saved for the district through which it passes. I find the highway rates levied in England and Wales for the repairs of parish roads vary very considerably. In Lancashire, Lincolnshire, and Cambridgeshire the rates appear highest, and the cost of the repairs correspond. The rates in these counties are about 10*d.* to 11*d.* in the pound, and the cost of repairs from 17*l.* to 21*l.* per mile. In Westmoreland, Cumberland, Devon, and Norfolk, the rates are lowest. In these counties they vary from 3*d.* to 6*d.* in the pound, and the cost of repairs is as low as 4*l.* 6*s.* to 5*l.* 7*s.* per mile. The average cost of repairs of highway is 11*l.* 3*s.* These figures will enable us to contrast the single item of effective superintendence at 1d. in the pound, or 1*l.* per mile with the present cost of imperfect reparation, under management partly gratuitous and partly paid for, and it will not be difficult to believe that the gain in the cost of maintenance to be secured by consolidated management in qualified hands will be 10 per cent., which is more than enough to pay the whole cost of superintendence. In closing this part of the subject I have only to express the hope that the resolution which shall emanate from this Club will convey an acknowledgment of the evils attending the present mode of managing public roads and the advantage to be gained by consolidation. The experience or rather the want of experience we have had of the 5th and 6th William IV., cap. 50, (which enabled parishes to combine voluntarily and has remained a dead letter) will oblige us, I think, to add that legislative measures to be operative must be compulsory. Time will admit of my saying but little upon the second part of the subject now presented for discussion. I refer to the economy and cost of private roads, those internal communications within the farm which serve to reduce the cost of labour in the traffic through and upon it. It has fallen to my lot when acting as engineer to the General Land Drainage and Improvement Company, to hear all kinds of opinions of the value of farm roads. I have known good heavy land farms vacated and remain unoccupied for the want of internal roads; and as the very opposite of this fact I heard one farmer in the Vale of Belvoir assert last week, when the question was asked him, what additional rent he was willing to pay for the accommodation of a road through the middle of his land from the public highway to his homestead, that he could do as well without the road as with it, if he was to be charged anything for it. Now when I state that the farm referred to was entirely on lias clay, and that there was only a field track marked by ruts in which a dog could run without being seen, and that the homestead was 70 chains from the highway referred to, I am sure there is no one here but who will admit that if the tenant was paying a fair rent for the land without any road whatever, he could very well afford to pay something for a good one.

(*To be continued.*)

Miscellaneous.

The New Market at Copenhagen Fields is to be opened formally on Wednesday next, when H.R.H. Prince Albert will be present at an entertaiment given by the City of London.

Calendar of Operations.

JUNE.

Farm near Chelmsford, *May* 30.—Since our last communication we have had a continuance of cold northerly and north-easterly winds, with some showers about the 11th, and a few days of milder weather, from the 24th to 27th; but vegetation progressed slowly, and a week ago the best pasture land would not afford a good bite for cattle, and unless a large amount of rain falls, with warm weather, within the ensuing fortnight, the crop of hay, both of Grass and Clover, must be unusually light. Such has been the cold state of the weather by night, and the absence of sunshine by day, that although the rain which fell upon the 13th and succeeding days was sufficient to cause all descriptions of seeds to vegetate, yet here, on the 24th, Oats, Mangold, Carrots, &c., were but just appearing, and are consequently one month more backward than in ordinary seasons. This, however, would have been of little moment provided genial weather had ensued; plants at such periods making rapid strides, and in the end recovering the time lost in the early spring. Upon this farm the Wheat is unusually promising; the plant is generally good, it tillers remarkably well, is of a healthy green colour, and grows compactly and closely to the surface of the ground. Upon all the well farmed lands of this district it also promises well, and although deficient upon light gravelly soils and some of the strong clay lands after Clover, may upon the whole be considered as looking well; it is, notwithstanding, later than in ordinary years, which it will recover under a warmer state of atmosphere. Barley and Oats are also promising, and greatly exceed in appearance that of other seasons. Winter Beans are for the most part a failure upon this farm, as we before stated; they have been ploughed up, and the land fallowed, and, reduced to admirable tilth, is now planted with Potatoes, or sown with Mangold Wurzel and Swede Turnips. In our last communication we adverted to our Mangold Wurzel seed being sown; it has only recently appeared above the surface, but is a full plant, and although the plants are smaller than we recollect having seen them before, are healthy and free from attack by insects. Owing to some deficiency of plant on several previous occasions we this year took the precaution to mix a little Swedish Turnip seed with the Mangold seed, and it appears of itself almost sufficient for a plant. What are not required can be easily hoed out, but wherever the Mangold plants are deficient will be left. Before running it should be moistened with some clammy substance, such as treacle, to prevent its separating from the Mangold seed, as it has a tendency to do so, and to come up irregularly. But the better plan where a manure drill is used, is to incorporate it with the superphosphate or some other portable manure. From the scarcity of cattle food experienced this season this root must become more extensively grown in succeeding years, and perhaps as we are successful in its production a few hints may not be now out of place upon its cultivation. As early in autumn as possible plough up a Wheat stubble, to the depth of 4 or 5 inches if it requires cleaning from Couch and weeds. Then harrow and scarify it, and give a deep cross-ploughing or two before winter, make it into ridges or baulks of 30 or 32 inches in width, subsoil the furrows 5 inches more, and whenever the weather is suitable plough the ridges again and subsoil the furrows, but unless the weather is very suitable this last ploughing should be deferred until March or April. Carry on about 12 tons of partially decomposed manure of good quality, sow 2 cwt. of fish, or hide salt, if procurable, or common salt instead, with 2 cwt. of guano; plough the soil over the manure, roll closely if sufficiently dry, so as not to squeeze compactly; drill 3 to 4 lbs. of seed mixed with a little Swede Turnip seed and 1 cwt. of superphosphate of lime per acre, or it may be dibbled 16 inches from hole to hole at about 1 inch in depth, in either case taking care not to deposit the seed more than an inch in depth; roll lightly afterwards, but if the weather is showery leave the drills uncovered, horse hoe the furrows as soon as weeds appear, previously forking out by hand process every particle of Couch, Docks, or root weeds. Take care never to let weeds grow so as to choke the young plants; when 2 inches high single them out, selecting the best plants and pulling away the root, at 16 inches intervals, or chop out with a hoe and single afterwards by hand. This is best done by having a sufficient number of boys or women to keep close up to the hoers. Keep entirely free from weeds by the horse-hoe, and by hand-hoeing the earth from the plants. About the middle of September commence using the leaves by cutting up with straw into chaff, pulling and storing the roots soon afterwards This process may be continued until December, if it is desirous to economise the leaves, but the roots should be immediately pulled and stored also, or frost may injure them; pack them in oblong heaps 6 to 8 feet wide, with the crowns outwards, bringing them to a ridge similar to the roof of a thatched or tiled building to about the height of 6 feet, cover with Wheat-straw, then dig the surrounding earth and cover over 6 inches thick, leaving about 1 foot on each side for a week or two uncovered for the heated air to escape, and when earthed up afterwards a twisted bunch of straw should be inserted about every 5 feet, for the ventilation of the mass. The earth should be beaten compactly and stoutly thatched over with Barley or Wheat straw to keep out severe frosts. The roots ought not to be used until after January, or until their second vegetation has commenced, a chemical action upon the juices taking place at that time, so that the sugar becomes fixed; it should be plucked into small pieces or bruised with a heavy wooden mallet, pulped or sliced, and mixed with cut straw chaff, feeding cattle with from 40 to 80 lbs. per diem, as it consists of nearly four-fifths of its weight of water. This precaution is necessary to prevent scouring of the neat cattle, to which it has a great tendency in the early spring months; it improves gradually till July, up to which time it may be used for every description of live stock; it however should not be given to breeding ewes, &c., before lambing, or to sows whilst breeding, to little pigs it is also injurious, but those of five or six months old thrive remarkably well upon it. Much of the success attending its production depends upon the quality of the seed; there is little if any difference, as regards quality or value, betwixt the Long and Globe Red, and the Long Orange and Globe varieties. Upon the best and heaviest descriptions of mixed soils the Long Red is most productive, upon the lighter descriptions the Globe Orange is the best; the produce varies from 20 to 30 tons per acre. The roots should be selected for seed of a clear uniform colour, fine crowns, with bright glossy leaves, the root should end in a single top to each without fangs, and abundance of small fibres, and having such slight hold of the soil as to be pulled easily without the assistance of any implement, and by twisting, not cutting, off the leaves, which if not required for cattle should be ploughed in for manure. Upon strong soils it is usual to manure plentifully with long stable dung, ploughing deeply before winter and merely scarifying the land in the spring, about the middle of April drilling in the seed with about 1 cwt. of artificial manure or superphosphate of lime per acre. We have dwelt at so great a length upon this subject that your space will not allow much further remark, but as we sometimes in our experiments succeed well and sometimes on the contrary, it behoves us alike faithfully to mention those of the unsuccessful character. It will be recollected that we mentioned having applied lime combined with salt to our Potatoes at the time of planting to prevent disease, and so far as appearances lead us to judge, we fear most of the Potato cuttings are killed by the preparation accelerated by the dry state of the soil. We obtained the hint from the observations of an experienced farmer at the London Farmers' Club, and after having escaped miraculously from a conflagration of our premises by the lime and salt having caused ignition of portions of the building, we shall in addition forfeit the crop, wholly or nearly so, by this experiment. At present it is impossible to say what the result may be upon portions planted without the application of the lime and salt. The Potatoes are looking vigorous and healthy, whilst those so prepared cannot yet be seen. In your columns a correspondent remarks upon our having stated "that rooks never feed upon insects if they can procure grain," and proceeds to establish the facts to be otherwise, by showing that they have fed upon the larvæ of insects during the past month, but admits that his earliest grown crops have been devoured by them. Rooks, like most other birds, feed their young upon grubs and insects, but wherever grain is to be had, they prefer living entirely upon it. They doubtless effect a great deal of good at certain seasons, but like the sparrow it is certain that they effect much injury. The question is therefore whether under the present state of cultivation of our lands they should be suffered, as in the instance to which we alluded, to increase to such an extent as to lay the whole surrounding district under contribution of black mail for their support, as it is only when in great numbers that they become emboldened to do great acts of mischief, and in such instances it is next to impossible to prevent them accomplishing it, by reason of their vigilance and early and late habits. We have cultivated farms upon which rooks were never seen for many months together, but we have not any recollection of being more injured by insects than at present where they abound. Upon arable lands well farmed and kept clear of decaying vegetable matter and sour Grasses, scarcely any insects will be found to exist so as to be injurious, and in such cases the rooks would be better away. In the winter months they resort to marshes, and live principally upon grubs found at the roots of the decaying Grasses, especially those of the large gnat called "daddy-long-legs," so prevalent in autumn. Next to these grubs they appear to prefer the wireworm, but neither worms or slugs are ever eaten by them except in seasons of great drought. The advocates for their preservation inquire naively for what purpose except that of good were they designed? We do not deny the fact, and inquire in return, for what good purpose were rats designed? and pause for a reply. We shall have neither Grass, Clover, or Vetches; unless abundance of rain follows, these crops will be exceedingly deficient. Wheat and Barley, however, would doubtless be injured by rain; they are now over-luxuriant, and would ill succeed with any continuance of showery weather.

Notices to Correspondents.

Legal Questions: *J K and X Y Z.* We do not give professional answers except to purely agricultural questions. Unprofessional opinions as to what is justice do not always correspond with professional opinions of what is law. If any one, owing to faults in *his own* fence, suffers by the straying in upon him of his neighbour's cattle—*those cattle being of the kinds ordinarily grazed in fields*—we imagine he has no remedy against his neighbour, but is himself alone to blame.——As to the sheep sold to the butcher, if he bought a certain lot of sheep and had a certain time allowed him for their removal, the death of any during that time is his loss, not yours.

Steaming Apparatus: *G C* asks Mr. Horsfall to be kind enough to tell an intending imitator of his dairy management, whose steaming apparatus he employs.

SCYTHES.

BOYD'S PATENT SELF-ADJUSTING SCYTHES may be had of the Manufacturers, William Dray & Co., Swan Lane, London; and of all Ironmongers and Seedsmen. A liberal allowance to the trade.

PARKES' STEEL DIGGING FORKS & DRAINING TOOLS.

MESSRS. BURGESS and KEY, as Mr. Parkes' Wholesale Agents for England, have always in stock a large assortment. These Forks and Tools are now in use by upwards of 1000 of the Nobility and Farmers, members of the Royal Agricultural Society, who pronounce them to be the best ever invented, and to facilitate labour at least 20 per cent. Price Lists sent free on application, and Illustrated Catalogue of the best Farm Implements, on receipt of eight postage stamps.

RICHMOND & CHANDLER'S PATENT CHAFF-CUTTING MACHINE.

All the various modern Implements of Agriculture manufactured on the most scientific and improved principles, suitable for home use and exportation.—Address, Richmond & Chandler, Salford, Manchester; and 32, South John Street, Liverpool.

☞ Catalogues Gratis.

IMPROVED MOWING AND ROLLING MACHINE.

ALEXANDER SHANKS and SON, Arbroath, Forfarshire, Inventors and Sole Manufacturers, respectfully solicit the attention of the Nobility, Gentry, and Gardeners to this Improved Machine for Mowing and Rolling Lawns. The Machine is in operation in the Royal Gardens at Windsor Palace, Buckingham Palace, and at Osborne, in the Botanical Gardens at Kew, Regent's Park, Manchester, Sheffield, &c.; at Blenheim Palace, Trentham, Cleveden, Elvaston, Broadlands, Woburn Abbey, Clumber, Lilleshall, Castle Howard, Shrubland, Fridge Castle, Enville Hall, Tiptree Hall, Chatsworth, and in many other of the principal gardens in the kingdom as well as in the United States, British America, and on the Continent, where its merits have been fully proved, and its success established.

The machine is made to cut the breadth of 42, 30, 20, and 15 inches respectively, is exceedingly durable, easily managed, and adjusted to cut to the length required. The execution of the work is far superior to what may be attained by the most skilful mower, while at the same time a great saving of labour is effected, and the turf much improved. By the largest machine a Scotch acre may be mowed, rolled, and the Grass collected in one hour.

A. S. and Son have much pleasure in stating that they have made considerable improvements in their 15-inch or hand machine this year, by which the draught is considerably lessened. This machine combines all the merits and advantages of the larger machines with firm and secure construction, and is admirably adapted for borders and for lawns of no great extent.

Alexander Shanks and Son also respectfully solicit notice to "Fleming's Weeding or Salting Machine" for destroying weeds in gravel walks, court-yards, drives, &c. This machine is now in operation in many parts of England, where it has given ample satisfaction as the best and most economical means of thoroughly keeping down weeds or Moss.

Further particulars, with testimonials and prices, may be had on application.

"FRIGI DOMO."—Patronised by her Majesty the Queen, the Duke of Northumberland for Syon House, His Grace the Duke of Devonshire for Chiswick Gardens, Professor Lindley for the Horticultural Society, Sir Joseph Paxton for the Crystal Palace, Royal Zoological Society, Mrs. Lawrence, of Ealing Park, and — Collier, Esq., of Dartford.

PROTECTION FROM MORNING FROST.

"FRIGI DOMO," a Canvas made of patent prepared Hair and Wool, a perfect non-conductor of Heat and Cold, keeping, wherever it is applied, a fixed temperature. It is adapted for all horticultural and floricultural purposes, for preserving Fruits and Flowers from the scorching rays of the sun, from wind, from attacks of insects and from morning frosts. To be had in any required length, 2 yards wide, at 1*s.* 6*d.* per yard run, of Elisha Thomas Archer, whole and sole manufacturer, 7, Trinity Lane, Cannon Street, City, and the Royal Mills, Wandsworth, Surrey; and of all Nurserymen and Seedsmen throughout the kingdom. "It is much cheaper than mats as a covering."

WARNER'S IMPROVED LIQUID MANURE OR GENERAL PORTABLE PUMP.

The valve is a ball of imperishable material, and cannot clog in action. The barrel is of galvanised iron, not likely to corrode, and can be raised or lowered at pleasure. The legs will fold together, and the whole may be carried on shoulder to any pond or tank required.

Price of 4½ in. Pump, with legs, 3*l.* 3*s.* The barrel is 27½ in. long, and the legs are 5 ft. high.

1½ inch Gutta Percha Suction Pipe, 1*s.* 6*d.* per foot.

1½ inch Flexible Rubber and Canvas Suction Pipe, 3*s.* 6*d.* per foot.

May be obtained of any Ironmonger or Plumber in town or country, at the above prices, or of the Patentees and Manufacturers, John Warner & Sons, 8, Crescent, Jewin Street, London.

Every description of Machinery for Raising Water, by means of Wheels, Rams, Deep Well Pumps, &c.; also Fire and Garden Engines, &c.—Engravings sent on application.

WARNER'S PATENT VIBRATING STANDARD PUMPS.

PATENT CAST-IRON PUMPS, for the use of Farms, Cottages, Manure Tanks, and Wells of a depth not exceeding 30 feet.

Diameter of Barrel	Length of Barrel, under nose.		£ s. d.
2½ in.	short 1 ft. 7 in.	Fitted for lead, gutta percha, or cast iron flanged pipe, as required.	1 12 0
2½ „	long 3 „ 3 „		1 15 0
3 „	ditto 3 „ 6 „		2 12 0
3½ „	ditto 3 „ 6 „		2 18 0
4 „	ditto 3 „ 6 „		3 5 0
2½ „	short, with 15 feet of Lead Pipe attached, and Bolts and Nuts ready for fixing		2 12 0
2½ in.	long ditto	ditto ditto	2 15 0

The short barrel Pump is very convenient for fixing in situations of limited height and space, for the supply of coppers and sinks in Wash-houses with soft water from underground tanks, or in Hot, Forcing, and Plant Houses; they may be fixed, when desired, under the stage.

May be obtained of any Ironmonger or Plumber in Town or Country, at the above prices, or of the Patentees and Manufacturers, JOHN WARNER AND SONS, 8, Crescent, Jewin Street, London.

Every description of Machinery for Raising Water, by means of Wheels, Rams, Deep Well Pumps, &c.; also Fire and Garden Engines, &c. &c.—Engravings sent on application.

JOHN WARNER AND SONS,

Crescent, Jewin Street, London.

GALVANISED IRON TUB GARDEN ENGINE,

With Warner's Registered Spreader,

is strongly recommended, for durability and low price, viz., 2*l.* 19*s.*, to hold 10 gallons.

Larger sizes in wood or iron, viz., 14 gals., 24 gals., & 35 gals. May be obtained of any Ironmonger or Plumber in town or country, or of the Patentees and Manufacturers, as also Machinery of all kinds for raising Water from any depth to any height by Steam, Horse, or Manual Power. Prices sent on application. Syringes of various constructions and sizes from 9*s.* upwards. Metallic String from 5*d.* to 1*s.* 3*d.* per lb.

JOHN WARNER AND SONS, 8, Jewin Crescent, London, Manufacturers of FIRE ENGINES, PUMPS, GARDEN ENGINES, and SYRINGES.

Brass Syringes, 9*s.* to 18*s.*

All articles of John Warner & Sons' manufacture may be obtained of any Ironmonger or Plumber in town or country, at the advertised prices.

John Warner & Sons having been practical Horticulturists for many years, know exactly the requirements of both Amateurs and Gardeners. A gardener with a properly constructed pump will get through as much work in five minutes as he could with any Syringe in a quarter of an hour, and with half the labour to himself. Syringes are economical for small houses.

No establishment offers such a variety of effective machines for hydraulic purposes, whether to supply Gardens, Hothouses, Cottages, Farms, Mansions, or Boards of Health, with every requisite connected with the conveyance and distribution of liquids.

Fountains suitable for Conservatories, Lawns, &c.

Sheets of Engravings sent on application.

BLACK JAPAN VARNISH.—This article will be found from its durability and cheapness of the greatest utility for Painting Hurdles, Wire-work, Palings, Gates, Fences, &c., and out-door work of every description, whether of Wood or Iron. Its value has been proved by the test of time. It should be well stirred up before using and applied cold. This Varnish will retain its quality for any length of time, provided the cask be kept closed.

May be obtained through any ironmonger; or of John Warner & Sons, 8, Jewin Crescent, London.

N.B. Sold in casks containing 28, or 14 gallons, at 2*s.* per gallon. Casks (which cannot be returned), 5*s.* each.

WARNER'S SWING WATER-BARROW (TO HOLD THIRTY GALLONS)

Is intended for all large Establishments where much watering is done by the watering-pot. By its use much time and labour of the Gardener are saved, particularly where the Tank, Pond, or Pump, is at a distance from the garden. May be obtained of any Ironmonger in town or country for 3*l*, 3*s*.

Manufactured by

John Warner & Sons, 8, Crescent, Jewin Street, London.

(Fig. 1.) (Fig. 2.)

J. TYLOR AND SON'S BARROW GARDEN ENGINE (Fig. 1), in best well painted oak tub, fitted with improved Pump, universal joint, and registered Spreader, which answers the purpose of the separate rose fan and jet.

No. 1 holds 10 gallons, throws 30 feet high	...	£4	10
No. 2 „ 15 „ „ 45 „	...	5	10
No. 3 „ 28 „ „ 45 „	...	6	18

J. TYLOR & SON'S BARROW GARDEN ENGINE (Fig. 2), in strong tinned iron tub, well painted inside and outside, with improved Pump, universal joint, and registered Spreader, which answers the purpose of the separate rose fan and jet.

No. 10 holds 8 gallons, throws 25 feet high	...	£2	15
No. 13 „ 12 „ „ 30 „	...	3	5
No. 11 „ 16 „ „ 40 „	...	4	0

No. 14 „ 30 „ „ 45 „	...	5	18

A large assortment of every description of Garden Syringes, Pail Engines, Conservatory Pumps, &c., kept in Stock.

No. 1, Plain Syringe, with rose and jet, diameter of barrel, 1½ inch, 14*s.* 3*d.*; No. 2, do., diameter of barrel, 1⅜ inch, 12*s.*; No. 3, do., diameter of barrel, 1⅜ inch, 10*s.* 6*d.*

Read's Syringe, with two roses and one jet, 19*s.*

J. Tylor & Son's Horticultural Apparatus may be obtained at these prices from any respectable Ironmonger or Seedsman in town or country, through whom alone they will be supplied, and of whom Drawings and Prices may be had.

N.B. Cost of carriage, &c., not included in these prices.

J. Tylor & Son's Manufactory, Warwick Lane, Newgate Street, London.

J. TYLOR AND SON'S REGISTERED GARDEN SYRINGE.—Small size, for Amateur use, **21s.** each. Large size, for Gardeners' use, **25s.** each.

Extra for Telescope Tube as shown in engraving for watering plants on stands at a height of 8 feet, so that any quantity of water can be deposited in the pot without wetting the leaves, 10*s.*

By a simple arrangement this Syringe is rendered more effective than any portable Conservatory or Garden Pump ever offered to the public. It is equally adapted for Garden or Conservatory use, and is capable of discharging twice as much water in a given time as any other Syringe now in use. The arrangement consists in attaching a small flexible suction tube to the barrel of the Syringe, through which it is filled with water at every discharge of the previous contents. By this means the Syringe is always charged, and the pull-up stroke of the piston rendered perfectly easy, it having, indeed, no work to do, the barrel being previously full of water. Being thus made self-supplying, a great saving of labour is effected; and the necessity of stooping to fill the syringe at every discharge being done away with, the direction of the water can be maintained for any length of time. It is perfectly cleanly in its action, as it is not possible for any water to get on the outside of the barrel, which is a well-known inconvenience attendant on the use of every other Syringe. Its construction is perfectly simple, and cannot get out of order; the ground in ball valves and fittings used for filling all other patent Syringes being entirely superseded. To be had of any respectable Ironmonger or Seedsman in town or country.

J. Tylor & Sons, Manufacturers of Horticultural Apparatus Warwick Lane, Newgate Street, London.

N.B. These prices do not include carriage, package, or expense of delivery in the country.

FOR WATERING GARDENS.

HANCOCK'S IMPROVED VULCANISED INDIA-RUBBER HOSE AND TUBING is now manufactured especially for the above purpose: is of greater flexibility than any other description of Hose: is capable of resisting great pressure, and made suitable for attaching to the mains of water-works, or to tanks of high elevations.

WATERING HOSE fitted up with the necessary *brass pipes, stop-cocks, branches,* and *spreaders complete.*

VULCANISED INDIA-RUBBER SUCTION PIPES, made any length or size for Pumps or Garden Engines.

VULCANISED RUBBER WASHERS, and also in Sheet, any thickness, for all kinds of steam and water joints, or made any size or figure to order.

All communications and orders punctually attended to, addressed to the Manufactory, Jas. Lyne Hancock, Goswell Road, London.

WATER YOUR GARDENS WITH THE IMPROVED FLEXIBLE GUTTA PERCHA TUBING.

Half-inch, 4*d.* per foot, light; 4½*d.* per foot, strong; larger sizes in proportion, for manuring land, &c.

Brass-hand tubes, with rose, jet, and tap, from 4*s.* 6*d.* each.

Union Joints, 1*s.* 6*d.* each, fitted complete.

Instructions given to affix joints to Taps.

Garden Engines, of great power, 4*l.* 4*s.* each. Self-supplying do., 4*l.* 4*s.* each.

Post Office Orders payable at City Road Branch.

JAMES W. WATTS, Gutta Percha Factory, 27, City Road.

HOSE PIPING.

TO ENGINEERS, AGRICULTURISTS, GARDENERS, SHIP CHANDLERS, AND FIRE BRIGADES.

WAITHMAN'S PATENT FLAX TUBING (1 in. to 3 inches in diameter) will sustain a greater pressure, is lighter, less bulky, will wear longer, and is about 60 per cent. cheaper than the leather hose pipe. Manufactured only by Waithman & Co., Bentham, Lancaster.

Inches in Diameter and Price Per Yard.—⅝, 11*d.*; 1, 1*s.* 1*d.*; 1¼, 1*s.* 3*d.*; 1½, 1*s.* 7*d.*; 1¾, 1*s.* 9*d.*; 2, 2*s.*; 2½, 2*s.* 3*d.*; 2¾, 2*s.* 6*d.*; 3, 2*s.* 9*d.*

Testimonial from Mr. Wright, Lancaster.—I beg to inform you that I yesterday tested your piece of 2½ inch Patent Flax Tubing connected with the Lancaster Waterworks, in the presence of the Mayor, Mr. Rawlinson, Government Inspector, Professor Owen, &c. The column of water at which the tubing was tried was equal to 340 feet in height, or about 150 lbs. on the square inch, and I have pleasure in stating that the hose sustained the pressure most admirably.

Testimonial of Captain Martin, of the Great Britain Steam Ship.—I have much pleasure in being able to tell you that your hose supplied to the Great Britain and other ships, is well worth the attention of shipowners. It gives us great satisfaction.

Testimonial from Fairbairn & Co., of Leeds.—We have tested your hose, 2½ inch in diameter, with the pressure of the Leeds Waterworks, and found it highly satisfactory.

FOR LIQUID MANURE AND AGRICULTURAL PURPOSES.

EDWARDS' IMPROVED CANVASS SUCTION HOSE, is the Cheapest and Best in use. Wove Canvas Hose, without seam, &c.—32, Great Sutton Street, Clerkenwell.

COTTAM AND HALLEN have on Show, at their Repository, No. 2, Winsley Street, Oxford Street, London, a great variety of the following articles for the Garden, &c., at very low prices, viz.:—Garden Rollers, Cast-Iron Rickstands, Garden Engines, Mowing Machines, Garden Chairs, Superior Garden Tools of all kinds, Garden Vases and Pedestals in great variety, and a large assortment of Horticultural and Agricultural Implements.

Ornamental Wire Flower Stands, Pot Trainers, Rose Tree Guards, Flower Bordering, and every description of Wire Work, both plain and ornamental.

Hand Glass Frames, Cast and Wrought Iron Flower Stakes, Garden Arches, &c.

Strong Iron Hurdles, and best Wire for Strained Wire Fencing.

Hothouses, Conservatories, &c., made upon the most improved principle, either of Iron, or of Iron and Wood combined, which can be fixed complete, with Hot Water Apparatus, in any part of the Kingdom.

Show Rooms at the Manufactory, 2, Winsley Street, Oxford Street, opposite the Pantheon, where every information may be obtained.

GALVANISED WIRE GAME NETTING.—7*d.* per Yard, 2 Feet Wide.

		Galvanised.	Japanned iron.

COWS.

HARVEY'S CELEBRATED COW DRINKS, 1s. each, have been used with great success. Plain directions are given with each Drink for the treatment of most diseases incidental to Cows, for which they will be found a safe and effectual remedy. One Drink given at the commencement of the Tick, or Feet and Mouth Distemper, will perfectly eradicate it in a few days.—Compounded by R. HARVEY, Veterinary Surgeon, Macclesfield, Cheshire. Sold by all Medicine Vendors. Wholesale Agents, BARCLAY & SONS, and MARSDEN & SONS, London.

ASTROLOGY.—Persons residing in London or elsewhere can send any Address, Christian and Surname, and Age, in a letter containing 13 postage stamps, to Professor MELVILLE, Princes Road, Lambeth, London (the only Acrostic Astrologer in the universe), and they will receive by return of post special poems on their names, in which their Destinies will be revealed.

THE SUCCESSFUL RESULTS OF THE LAST HALF CENTURY HAVE PROVED BEYOND QUESTION THAT

ROWLAND'S MACASSAR OIL possesses peculiarly nourishing powers in the growth, restoration, and improvement of the human Hair, and is now universally acknowledged to be the cheapest, and superior to all other preparations for the hair. It prevents it from falling off or turning grey, strengthens weak hair, produces a thick and luxuriant growth, cleanses it from scurf and dandriff, and makes it beautifully soft, curly, and glossy. In the growth of the Beard, Whiskers, Eyebrows, and Moustachios, it is unfailing in its stimulative operation. For children it is especially recommended, as forming the basis of a beautiful head of hair. Price 3s. 6d. and 7s.; Family Bottles (equal to four small), 10s. 6d.; and double that size, 21s. CAUTION.—On the wrapper of each bottle are the words, Rowlands' Macassar Oil, in two lines.—Sold by A. ROWLAND & SONS, 20, Hatton Garden, London, and by Chemists and Perfumers.

DO YOU WANT LUXURIANT HAIR, WHISKERS, &c.?—No other compound for the Hair has maintained such an enduring celebrity as EMILY DEAN'S CRINILENE. It is guaranteed to produce Whiskers, Moustachios, Eyebrows, &c., in a few weeks, and restore the Hair in Baldness, from whatever cause, strengthen it when weak, prevent its falling off, and effectually check Greyness in all its stages. —Price 2s. per package (elegantly perfumed); sent post free, on receipt of 24 penny postage stamps, by Miss DEAN, 37 A, Manchester Street, Gray's Inn Road, London. Sold by every Chemist in the world.—"In one fortnight it produced a beautiful set of moustachios." H. ADAMS.—"It has prevented my hair falling off." J. HICKSON.—"It has quite checked the greyness that was coming on." MRS. ELDER.

Beware of imitations under closely similar names.

DINNEFORD'S PURE FLUID MAGNESIA has been for many years sanctioned by the most eminent of the Medical Profession, as an excellent remedy for Acidities, Heartburn, Headache, Gout, and Indigestion. As a mild aperient, it is admirably adapted for delicate females, particularly during pregnancy; and it prevents the food of infants from turning sour during digestion. Combined with the Acidulated Lemon Syrup, it forms an Effervescing Aperient Draught, which is highly agreeable and efficacious.—Prepared by DINNEFORD & Co., Dispensing Chemists (and General Agents for the Improved Horse-Hair Gloves and Belts), 172, New Bond Street, London, and Sold by all respectable Chemists throughout the Empire.

DEVONSHIRE CYDER.—A three dozen case (large bottles), of the very best DEVONSHIRE CHAMPAGNE CYDER, will be forwarded to any address on receipt of a Post-office order for 21s., payable to JOHN E. RENDLE, Martin Street, Octagon, Plymouth. Case and bottles, value 9s., included.

GLENFIELD PATENT STARCH, USED IN THE ROYAL LAUNDRY, AND PRONOUNCED BY HER MAJESTY'S LAUNDRESS TO BE THE FINEST STARCH SHE EVER USED.

Sold by all Chandlers, Grocers, &c. &c.

THE UNIVERSAL CAPE, Price 20s.; or Lined and Waterproof, 30s.; Reversible, 35s. A new and most gentlemanly full length sleeved garment, calculated by its lightness, utility, durability, and EXTREME CHEAPNESS speedily to be universally adopted. An inspection will render commendation needless. One of the largest stocks in London of Light Coats, Capes, &c.

W. BEBDOE, 96, New Bond Street, and 69, Cornhill (only).

METCALFE, BINGLEY, AND CO.'S OATMEAL and CAMPHOR SOAP, in tablets (registered Nov. 3, 1854). Price 6d. each. This soap will be found the purest and most perfect winter soap ever introduced to the public. It preserves the hands from chapping, and renders the skin soft and agreeable.—Sold wholesale and retail by the inventors and sole manufacturers, METCALFE, BINGLEY, & Co., Brushmakers and Perfumers to H.R.H. Prince Albert, 130B and 131, Oxford Street.

CAUTION.—To prevent fraud, each tablet bears the registered mark and the names and address of the inventors, as above.

METCALFE'S ALKALINE TOOTH POWDER, 2s. per box.—The above may be obtained of most respectable Chemists, Perfumers, &c.

DORKING BLUE MOTTLED FOWLS' EGGS, 12s. per dozen. Took first Prize at Brighton Exhibition of three counties, 1854.—Address Mr. ED. HENDEN, Beehive Inn, Dorking, Surrey.

GOLDEN PHEASANTS' EGGS, fresh from first-rate birds.—For price, &c., address GEORGE ROBERTS, Gamekeeper, Hunmanby, Scarborough, Yorkshire.

TO GARDENERS, FLORISTS, ETC.

ACACIA ROAD, ST. JOHN'S WOOD, NEAR REGENT'S PARK.

TO BE LET, on lease or otherwise, with immediate possession, the ACACIA ROAD NURSERY, situated in a first-rate neighbourhood for business, containing Greenhouses, Pits, and Frames, and every convenience for carrying out a good business. The Stock, containing many choice and various Plants in pots, &c., will be disposed of at a low rate. There is an excellent Residence with Coach and Potting Houses, also an Office and Seed Shop on the grounds; the whole well worthy attention, and will be disposed of at a very low rate. It may be viewed by applying as above.

NURSERY AND SEED BUSINESS.

TO BE SOLD, or LET for a term of years, a Nursery, Seed and Plant Business, which has been successfully carried on for the last 35 years in a rapidly rising and most fashionable watering-place in the south of England. The Nursery grounds are advantageously situated in the midst of the town, within half a mile of the Railway Station, and close to its principal entrance is the large Seed and Show Shop. The Grounds comprise about eight acres of good land, and four large Glass Structures, heated with hot water, with several pits and Frames, the whole being well furnished with a Young and Saleable Stock. Any person wishing to carry on the above business will find this well worthy of attention. Satisfactory reasons will be given for the retirement of the present proprietor.—For further information apply to Messrs. E. G. HENDERSON & SON, Wellington Road, St. John's Wood, London.

TO BE SOLD, the LEASE of a very compact NURSERY and GRAPE GROWING BUSINESS near London. Any person about entering into business will find this a genuine concern. The sum required to take it is 250l.—For further particulars apply to Mr. WARD, Stationer, &c., Camberwell, Surrey.

TO CORN DEALERS.

TO BE SOLD, an old-established CORN-CHANDLER'S BUSINESS, situate in a desirable part of the west end of town, having a large connection among the nobility and gentry. Premium 300l. Stock and Fixtures to be taken at a valuation.—Address and cards to view to be obtained at Messrs. MANSELL & ELLIOTT'S, Surveyors and Auctioneers, 13 A, Belgrave Square, and 12, Birchin Lane, London.

TO BE SOLD, with immediate possession, a HOUSE and SHOP doing a good ready money business, in the Seed, Herb, and Plant Trade. Jobbing may be added with advantage. —Apply by letter only to A. B., 25, Manor Place, Walworth, Surrey.

TO FLORISTS AND GARDENERS.

TO BE SOLD, A GREAT BARGAIN, by valuation or private treaty, a first-class stock of Geraniums, Fuchsias, Roses, Verbenas, Dahlias, Calceolarias, Mimulus, Chrysanthemums, Hollyhocks, Carnations, Picotees, Pinks, Phloxes, and a general good assortment of Plants for any one in the trade; consisting of a very large Greenhouse 150 feet long, Forcing and Propagating Houses, Cold Pits, and Box Lights, with all sorts of Tools for use; likewise three large Water Tanks, and a good supply of Water; Ground well laid-out; and also a good lot of Fruit Trees in full bearing.

N.B. Situated in Surrey, about nine miles from London, adjoining a railway station, and within half a mile of a good market town; a good Dwelling House upon the premises, can be taken by year or lease.

Dahlias from 3s. to 6s. per doz.; good sorts and strong plants.
Fuchsias „ 6s. to 12s. „ „ „
Verbenas „ 4s. to 6s. „ „ „
Pinks, Picotees, and Carnations, all named, equally cheap.

A good assortment of Bedding Plants cheap.—Apply to Mr. HOOK, 21, Brudinell Place, New North Road, Hoxton.

Sales by Auction.

12,000 BEDDING AND OTHER PLANTS.
WITHOUT RESERVE.

MR. J. C. STEVENS will sell by Auction, at his Great Room, 38, King Street, Covent Garden, on FRIDAY, 15th June, at 12 for 1 o'clock, in 200 Lots, about 12,000 BEDDING-OUT PLANTS, the property of the grower, who supplied 80,000 to the Crystal Palace Company. They consist of the best sorts of Scarlet and Variegated-leaf Geraniums, six of the best varieties of Heliotrope, 100 varieties of Chrysanthemums, and a large quantity of Hollyhocks, Verbenas, Fuchsias, Calceolarias, Salvias, Petunias, &c.—May be viewed on the morning of sale, and Catalogues had.

TO GENTLEMEN, FLORISTS, AND OTHERS.

MESSRS. PROTHEROE AND MORRIS will Sell by Auction, at the Mart, Bartholomew Lane, on WEDNESDAY and FRIDAY, June 13 and 15, at 12 o'clock, a first-class collection of Dahlias, Choice Roses, Petunias, Fuchsias, Verbenas, Calceolarias, Azalea indica, fine Geraniums, and other Plants in bloom, with a large assortment of Ornamental Plants for bedding.—May be viewed the morning of sale; Catalogues had at the Mart, and of the Auctioneers, American Nursery, Leytonstone, Essex.

LOUDON'S ENCYCLOPÆDIA OF PLANTS. New Edition, corrected to the Present Time, by MRS. LOUDON; assisted by GEORGE DON, F.L.S., and DAVID WOOSTER, late Curator of the Ipswich Museum.

*** This Edition contains nearly 250 additional pages, and above 2000 new Illustrations, without addition to the price.

Included in the above, and to be had separately, price 21*s.*

SUPPLEMENT: Comprising all Plants originated in or introduced into Britain between March 1840 and March 1855; with a new General Index to the whole Work, and above 2000 new Woodcuts.

"The first edition of this celebrated work, which is incontestably of the greatest utility to gardeners, and, indeed, to all who have not access to great libraries, consisted of 1159 pages; the latest in our possession filled 1329 pages; that now brought before the public occupies no fewer than 1574, forming a solid, massive volume of small print, comparable to nothing so well as to a dictionary. The great recommendation of the work has always been its woodcuts; which, although only miniatures, were nevertheless drawn by Mr. Sowerby with such happy art, and so skilfully engraved by Branston, that the plants could always be recognised, even by those little acquainted with the vegetable kingdom. The continuation in the form of supplements is executed in a manner more than worthy of the original, and brings down the subject to the latest possible moment..... How many figures the work contains we are unable to ascertain, but we estimate the number of plants actually represented by good woodcuts as amounting to something more than *nine thousand!*"—*Gardeners' Chronicle.*

London: LONGMAN, BROWN, GREEN, & LONGMANS.

NEW AND ENLARGED EDITION OF DR. LINDLEY'S THEORY OF HORTICULTURE.

Now ready, in 8vo, with 98 Woodcuts, price 21*s.* cloth,

THE THEORY AND PRACTICE OF HORTICULTURE; or, an Attempt to explain the chief Operations of Gardening upon Physiological Grounds: being the Second Edition of the "Theory of Horticulture," much enlarged. By JOHN LINDLEY, Ph.D., F.R.S., Corresponding Member of the Institute, Vice-Secretary of the Horticultural Society, Professor of Botany in University College, London, &c.

CONTENTS.

BOOK I.—The principal Circumstances connected with Vegetable Life which illustrate the Operations of Gardening:—

1. Vital Force
2. Germination
3. Growth by the Root
4. Growth by the Stem
5. Action of Leaves
6. Action of Flowers
7. The Maturation of the Fruit
8. Temperature.

BOOK II.—The Physiological Principles upon which the Operations of Horticulture essentially depend:—

1. Bottom Heat
2. Moisture of the Soil, Watering
3. Atmospherical Moisture and Temperature
4. Ventilation
5. Seed Sowing
6. Seed Saving
7. Seed Packing and Plant Packing
8. Propagation by Eyes and Knaurs
9. Propagation by mere Leaves
10. Propagation by Cuttings
11. Propagation by Layers and Suckers
12. Propagation by Budding and Grafting
13. Pruning
14. Training
15. Potting
16. Transplanting
17. The Preservation of Race by Seed
18. The Improvement of Races
19. Resting
20. Soil
21. Manure

"The author has always felt that the naked principles laid down in the First Edition of this work were less interesting than they would have been if they had received more extensive illustration from examples and frequent reference to practical operations. He has now therefore greatly extended the matter, and endeavoured, whenever it appeared necessary, to support the doctrines of physiology by an appeal to facts which are or should be familiar to all cultivators."—*Extract from Preface to Second Edition.*

By the same Author,

INTRODUCTION TO BOTANY. 4th Edition, greatly enlarged; with 6 Plates, and numerous Wood Engravings. Two vols. 8vo, 24*s.*

*** It has been the Author's wish to bring every subject that he has introduced down, as nearly as possible, to the state in which it is found at the present day. In doing so, he has added so very considerable a quantity of new matter, especially in what relates to Vegetable Anatomy and Physiology, that the present Edition may be considered, in those respects, a new work.

London: LONGMAN, BROWN, GREEN, & LONGMANS.

CHEAP STATIONERY, to be had only at ARTHUR GRANGER'S, 9, Holborn Bars, City, and 10, Fitzroy Terrace, New Road, London.

HORTICULTURAL SOCIETY OF LONDON.—NOTICE IS HEREBY GIVEN, that the NEXT EXHIBITION of FLOWERS and FRUIT, in the SOCIETY'S GARDEN, will take place on WEDNESDAY, June 20, at 2 P.M.

Tickets, price 5*s*. each, can be procured at this Office, upon presenting the order of a Fellow; or on the day of the meeting, at Turnham Green, price 7*s*. 6*d*. each.

SPECIAL PRIVILEGE OF FELLOWS.—Fellows of the Society not only enter free at half-past 12, but can also introduce two friends, WITH TICKETS. Or the Fellow's power may be transferred to a brother, sister, son, daughter, father, mother, or wife, residing in the Fellow's house, provided the person to whom the transfer is made be furnished with a ticket signed by that Fellow. That is to say, the power of entering early may be transferred, but not the right to FREE admission.

ROYAL BOTANIC GARDENS, REGENT'S PARK—THE EXHIBITION OF AMERICAN PLANTS will take place on MONDAY next, June 18. Tickets to be obtained at the Gardens only, by orders from Fellows or Members of the Society. Price 5*s*., or on the day of Exhibition, 7*s*. 6*d*. each.—Gates open at 2 o'clock.

AN EXTRAORDINARY MEETING OF THE BRITISH POMOLOGICAL SOCIETY will be held at the Rooms, 20, Bedford Street, Covent Garden, on MONDAY, July 2, at 1 o'clock. The object of this Meeting is to report upon the comparative merits of the fruits submitted for examination; and it is therefore hoped that all who have it in their power to contribute collections or single specimens of fruits will aid the Society in promoting its objects by forwarding them on this occasion. All packages should be delivered at the Rooms not later than 9 o'clock on the day of meeting, and addressed to

ROBERT HOGG, Secretary.

BRIGHTON AND SUSSEX FLORICULTURAL AND HORTICULTURAL SOCIETY, Royal Pavilion. The SECOND ANNUAL SUMMER EXHIBITION of PLANTS, FLOWERS, FRUITS, &c., will be held on WEDNESDAY and THURSDAY, the 27th and 28th of June next, on the same grand scale as last year. Schedules can be had by application to E. SPARY, General Superintendent of the Exhibition, or of the Secretary, E. CARPENTER, 45, Lavender Street, Brighton.

By the liberality of the London, Brighton, and South Coast Railway Company all plants will be conveyed to the exhibition and back carriage free from all stations on the lines.

By order of the Committee, EDWARD CARPENTER.

N.B. The Autumn Exhibition will take place on the 12th and 13th of September next.

SLEAFORD FLORAL AND HORTICULTURAL SOCIETY.—At the Annual Exhibition of this Society at Sleaford, on THURSDAY, the 26th of July next, an Extra Prize of Five Guineas, open to all England, will be awarded for the best collection of Twelve Stove and Greenhouse Plants, in addition to the usual Members and Cottagers' Prizes. The rules of the Society, with Schedules of Prizes, may be obtained on application to Mr. WARWICK, the Treasurer; or to Mr. PEAKE, Honorary Secretary.—Sleaford, June 16.

GARDENERS' BENEVOLENT INSTITUTION.—THOMAS JACKSON & SON respectfully recommend to the subscribers of the above Institution GEORGE KIDD, aged 70, who has followed gardening for 54 years, was a subscriber to the Institution 9 years, and now, from a fall rendering one hand useless, combined with age, he is unable to work. His case is strongly recommended by Messrs. OSBORN & SONS, Fulham; Mr. T. GAINES, Battersea; Mr. F. KINGHORN, Isleworth. Proxies will be gratefully received by T. JACKSON & SON, Kingston, Surrey.

EXHIBITION OF AMERICAN PLANTS.

KNAP HILL NURSERY, WOKING, SURREY.

WATERER AND GODFREY beg to announce that the AMERICAN PLANTS at this Nursery are now in great beauty, and may be seen daily gratis. The Nursery is readily reached by Railway to the Woking Station, where capital conveyances may always be obtained.

GREAT EXHIBITION OF AMERICAN PLANTS.

JOHN WATERER begs to announce that his unrivalled collection of Hardy, Scarlet, and other RHODODENDRONS, is now on view at the Royal Botanic Gardens, Regent's Park, London. Orders of admission are granted gratuitously by Fellows of the Society. The Plants at the Nursery are now in full bloom, and will continue in perfection throughout the month of June.—The American Nursery, Bagshot, Surrey, June 16.

SUPERB HOLLYHOCKS, SEEDS, ETC.

WILLIAM CHATER begs to offer packets of seed, consisting of 20 varieties, from his best Show Hollyhocks at 5*s*.; 12 varieties, 2*s*. 6*d*.; and from good double sorts, 1*s*. Superior Quilled German and French Asters, in 12 varieties, mixed, 1*s*. per packet; separate, 2*s*. Fine Quilled African Marigold, 6*d*. per packet.—Saffron Walden Nurseries.

MAY'S MAGNUM BONUM LETTUCE is by far the largest, sweetest, and crispest Lettuce known, in proof of which we possess numerous letters received from parties who grew it last season. The addresses of the writers can be had on application. It may be sown all the summer, and will stand the winter. Packets 1*s*. each.

HENRY MAY, the Hope Nurseries, near Bedale, Yorkshire.

TURNIP SEED OF PURE SELECTED STOCKS.

ORCHIDS.

TO BE SOLD, by Private Contract (the property of a gentleman), a most valuable collection of ORCHIDS; it contains large specimens of all the most esteemed and rare varieties, and is, it is believed, not excelled by any other collection in the kingdom. The plants are in the finest health.—For further particulars address by letter, to F. H. S., Messrs. C. & E. Layton, 150, Fleet Street, London.

AZALEAS AND ERICAS.

W. J. EPPS has much pleasure in offering the following fine, bushy, well-grown plants, and of the choicest and best varieties, in large 48 and 32-size pots.

AZALEAS 18*s*. per dozen; 5*l*. per 100.

ERICAS 12*s*. and 18*s*. per dozen; 4*l*. and 5*l*. per 100.

These will make very pretty specimens for the ensuing season; all orders to be accompanied with a remittance from unknown correspondents.—Maidstone, June 16.

CABBAGE PLANTS.

THOMAS WELLAND offers fine and true Drumhead for Cattle at 3*s*. 3*d*. per 1000; also fine Garden Plants, 3*s*. 6*d*. per 1000; crates and conveying to the station included.

Surrey Gardens, Godalming, Surrey.

EXTRA STRONG BEDDING PLANTS, 2*s*. 6*d*. per doz., INCLUDING PACKAGE, WHEN 10 DOZ. ARE ORDERED.

WOOD AND INGRAM beg to offer, at the above price, fine well-established plants of Anagallis, Ageratum, Calceolaria, dark, Cineraria amelloides, Heliotropes, Lobelia ramosoides, Nierembergia gracilis, Petunias, Senecios, Tagetes lucida, and Verbenas, all of the best kinds, and in great variety. Also a large quantity of good flowering plants of Show and Fancy GERANIUMS, and Show and Fancy DAHLIAS, of well known leading kinds, at from 4*s*. to 6*s*. per doz. The varieties to be sent may be seen in W. & I.'s Catalogue, which may be had on application.—Huntingdon Nurseries.

WILLIAM DENYER, SEEDSMAN AND FLORIST, offers the following RARE AND CHOICE SEEDS, suitable for present sowing:—

AQUILEGIA, 6 distinct and beautiful colours, 2*s*. These are quite hardy, and when planted out will last and flower for several years.

CALCEOLARIA, saved by an amateur from the most superb show flowers, 1*s*. per paper.

CINERARIA, from a splendid collection, 1*s*. per paper.

HOLLYHOCKS, from Chater's best varieties, 6 sorts, 2*s*.

STOCKS, Autumnal, or late flowering, 6 varieties, 2*s*.

" Emperor, or Perpetual, 6 vars. splendid, 2*s*. These are quite new, and different to any other Stock, being very double and of large growth, lasting and flowering for several years.

WALLFLOWERS, 6 gigantic double varieties, bright and singular colours, 2*s*. These are from a continental grower, who has gained many 1st class prizes.

ANTIRRHINUM, from a superb collection, 1*s*. Saved by an amateur.

PRIMULA SINENSIS FIMBRIATA, 1*s*. Saved from the best fringed flowers.

PANSEY, from the best flowers, 1*s*. Saved by Thompson and other eminent growers.—82, Gracechurch Street, London.

GARDEN VASES, FOUNTAINS, ETC.

THOMAS SOMMERVILLE, LANDSCAPE GARDENER, NURSERYMAN, SEEDSMAN, and FLORIST, Garden Road, St. John's Wood, London, begs respectfully to inform the nobility, gentry, and his patrons generally, that he has entered into arrangements with an eminent company in Scotland for the sole disposal in London of their highly ornamental and very durable Vases, Fountains, &c., samples of which may be seen at his grounds in the Garden Road, as above.

T. S. has much pleasure in being the first to introduce to the notice of the public a highly ornamental Vase, capable of resisting the most severe weather, and at little more than half the cost of any other possessing the same qualities; and he has no hesitation in stating that a more suitable Vase for the growth of plants cannot be manufactured.

CRYSTAL PALACE.

Verbenas
Miscellaneous bedding plants &c., &c.

Is now ready and can be had Post-free on application.
Paradise Nursery, Hornsey Road, Holloway, London.

NEW AND CHEAP FIRST-RATE SHOW AND BEDDING PLANTS.
The Cheapest Establishment in the Kingdom is at
HENRY WALTON'S, Florist, &c., Edge End, Marsden, near Burnley, Lancashire, where there are propagated annually for sale from 20,000 to 30,000 plants, which, for cheapness and quality, are not to be equalled, being robust and healthy.

GERANIUMS.—Strong blooming plants, of varieties of 1853, such as Empress, Carlos, Neatness, Glow-worm, &c., 25*s*. per dozen; older show varieties, 9*s*., 12*s*., and 15*s*. per dozen; 25 for 20*s*., 50 for 30*s*., good plants.
FUCHSIAS, new varieties of last season, 6*s*. to 9*s*. per dozen.
CINERARIAS, choice varieties, such as Advancer, Etoile de Vaise, Empress, &c., 10*s*. 6*d*. per dozen; older varieties, good show kinds, 3*s*. 6*d*. per dozen.
PANSIES, 12 distinct fine show varieties, 6*s*.; 25 fine vars., 12*s*.
VERBENAS, new varieties of last season, 4*s*. to 6*s*. per dozen.
DAHLIAS, all the leading show kinds of last season, 9*s*. to 12*s*. per doz.; older vars. 4*s*. 6*d*. to 6*s*. per doz., extra strong plants.
Bedding Plants, including Scarlet and other Geraniums Salvias, Heliotropes, &c., equally cheap.
H. W.'s Spring List may be had for one penny stamp.
It is respectfully requested that all Orders be accompanied with a Post-office Order payable at Marsden, Lancashire, unless a reference is given. Orders to the amount of 25*s*. paid to Liverpool, Manchester, Leeds, and Preston; 2*l*. and upwards free to Birmingham and Carlisle; and the like distance, or more distant, extra plants gratis.—Edge End, Marsden, June 16.

CINCHONA TREES, ORCHIDACEOUS EPIPHYTES, and other EXOTICS.
The undersigned, having obtained from the Government of New Granada a grant of an extensive district in which the above valuable plants are indigenous, has now well established and ready for sending to England fine young specimens of Cinchona (Lancifolia Mutis), C. cordifolia, and of a hitherto unnamed species, C. pubescens (Vahl.), the "tercio pelo" of the natives. Also ORCHIDACEÆ in numerous varieties, FERNS, &c. Prices as follows:—

	£	s.	d.
Packages containing 10 Cinchona trees, species assorted to order	25	0	0
Ditto 20 Orchideæ, various	15	0	0
Ditto 20 Epidendra, do.	15	0	0
Ditto 20 Ferns, the root-stocks	25	0	0
3 to 5 Tree Ferns	30	0	0
Ditto Lichens and Mosses in varieties	10	0	0

The state in which the plants may be expected to arrive in England may be inferred from the following extract of a letter from C. Loddiges & Sons, Hackney, near London.
"Dr. Blagborne, Bogota, Feb. 10, 1844. Dear Sir,—We have safely received your kind letter, also the plants in pretty good order, for which we are much obliged to you. . . Of the Espiritu Santo (Peristeria ittata) we will not trouble you for more, you having so liberally supplied us, but, &c."
The above prices include the heavy expenses to the coast, packing, &c., leaving nothing to be arranged by the purchaser in England but the maritime transit, which is trivial. All persons sending orders are requested to give their address with the greatest perspicuity, and, on receipt of bill of lading, to make immediate application for their plants to Messrs. Dunlop & Co., office of the Royal West India Mail and Steam Packet Company, Southampton. Orders from unknown correspondents must contain remittance in Bank of England paper, and be addressed Dr. Blagborne, Bogota, under cover to George B. Fisk & Co., Bogota, New Granada, South America, and lastly envelopped to Edward Herring & Co, Alkaloid Works, Trinity Street, Southwark, London.

JOSEPH NORRIS, Osterley Park, Hounslow, Middlesex, having an immense Stock of PANSIES, including all the finest and newest in cultivation, offers them at 6*s*., 9*s*., and 12*s*. per dozen, package included, sent to any address on the receipt of a Post Office Order, payable at Hounslow.
The Trade supplied.

H. LOW and CO. have to offer healthy plants of the undernamed. The list comprises many recent novelties of great merit, which are still rare:—

HENRY WALTON, Florist, &c., Edge End, Marsden, near Burnley, Lancashire, has now on hand a fine stock of the following, which may be had at the extremely low prices annexed:—Achimenes Carl Walforthi, 1*s*. 6*d*.; Cherita, 1*s*. 6*d*.; Louis Van Houtte, 1*s*.; Gigantea, 5*s*.; Madame Randatler, 3*s*.; Mr. Parparet, 1*s*.; Sir Traherne Thomas, 1*s*.; Hendersoni, 2*s*.; or the lot post free for 12*s*. Gloxinias, choice varieties, 1*s*. 6*d*. to 3*s*. 6*d*. each. Verbenas of this season, viz., Wonderful, Blue Beard, Lady Lacon, Commander-in-Chief, Empress of France, Florence Nightingale, Rose of England, Tyrian Prince, Eva, Boule de Feu, Lord Raglan, Empress, Mrs. M'Neil, Violacea, Silistria, and Mrs. Woodroffe, 1*s*. 6*d*., or 18*s*. per dozen post free. Clianthus magnifica, 2*s*. 6*d*. each. Begonia Prestoniensis, superb, 2*s*. 6*d*.; extra strong, 5*s*. Eugenia Ugni, 2*s*. 6*d*. Fine Show and Fancy Geraniums, 60*s*. per 100, or 50 for 32*s*. 6*d*. Scarlet and White, and older kinds of Geraniums, 3*s*. 6*d*., 4*s*. 6*d*. and 6*s*. per dozen. Dahlias, strong plants, 3*s*. 6*d*. per dozen. Bedding Plants, of sorts, equally cheap. Descriptive List may be had for one stamp.
It is respectfully requested that orders be accompanied with Post Office Order payable at Marsden, Lancashire, unless reference is given.

The Gardeners' Chronicle.

SATURDAY, JUNE 16, 1855.

MEETINGS FOR THE ENSUING WEEK.
Wednesday, June 20—Horticultural Gardens ..... 2 p.m.

A question was asked some time since by one of our correspondents, whether sulphuret of potash* had ever been employed as a remedy against mildew? We cannot say whether it has been so applied in this country, but it has been used in France successfully, and if an acid be added a fine precipitate of sulphur is deposited from the aqueous solution upon the leaves of the Vine or Hop, in a manner which would not be effected by any dredging.† It is, in fact, when properly diluted, precisely what is used very frequently for baths in certain cutaneous disorders. In all such applications the main question is how does the sulphur act? This is evidently a point of great importance, and from the insolubility of sulphur under ordinary circumstances not very easy of explanation.

We do not profess to be in a condition to answer this satisfactorily, but the observations we have to offer may induce some one to attend a little more closely to the matter. Sulphur has evidently a very prejudicial effect on fungi, as it has indeed on all organic beings if exposed to it in a proper form and in a sufficient degree of concentration. The use of sulphur in cutaneous disorders whether arising from insect or vegetable parasites; the effect of hypo-

* We suppose by sulphuret of potash, or more properly sulphuret of potassium, is meant what is known by chemists under the name of liver of sulphur. This is not a definite substance, but consists of tersulphuret of potassium, hyposulphite of potash, and sulphuret of potassium.

† Sulphuretted hydrogen is evolved at the same time.

sulphite of soda on the curious vegetable production known by the name of Sarcina, from its resemblance to little corded bales, which is so common in cancerous affections of the human stomach; and the destructive power which it has over parasitic moulds are all evidences of this fact. One particular instance may perhaps afford a clue to its action over the latter. It is well known that if a bundle of brimstone matches be burnt in a barrel, the fermentation of wine when placed in that barrel will be arrested. Now the fumes of brimstone consist of sulphurous acid, and as the whole body of the wine placed in the cask is affected, the quantity of the acid which is capable of arresting the growth of the yeast fungus must be almost infinitisimal. Now if the leaves of plants infested with mould are dusted with sulphur, though the sulphur is insoluble in water and may be exposed to ordinary air for a long time without change, it is very possible that the oxygen just separated from the foliage by the action of light in effecting the decomposition of carbonic acid, or arising from other chemical processes taking place within the plant, being in a nascent state, may readily combine with a portion of the sulphur, and thus form sulphurous acid, and still more in the application of a solution of sulphuret of potash with the addition of an acid, where the sulphur is in the act of being eliminated, and can combine at once, under the most favourable circumstances, with the nascent oxygen.

It would be easy for a good chemist to ascertain precisely whether sulphurous acid is really formed under such circumstances, or whether some other combination of sulphur and oxygen is given out, and it would be doing good service to the horticulturist to ascertain the point. Where sulphur is used to combat disease in the human frame, especially when applied inwardly, more than one combination takes place, and a large portion of the substance, when taken in a crude state, passes away unaltered. In its application to the purposes of cultivation it is likewise a small portion only in all probability which is effectual; and if the action could be precisely ascertained the results might be of great importance, in an economical point of view, where it is used largely, as in Hop gardens. *M. J. B.*

Botanical Gardens are on the Continent attached to all universities or collegiate establishments where the medical portion of the instruction imparted is considered as of any importance. For it is there universally admitted that botany, or the knowledge of plants from which the great majority of the most valuable medicaments are prepared, as well as chemistry, which teaches the mode of extracting the medicinal principle to the best advantage, are two most essential branches of a medical and especially of a pharmaceutical education; and a botanical garden, when well conducted with reference to its special object, is found to be of essential service in such a course of botanical lectures as the student in medicine requires. It is also of great assistance to the professor who would give to his pupils such an interest in botany as should induce them more or less to pursue it beyond the lecture-room, either as an independent science, or as a branch of general knowledge to be applied as occasion may point out in the various paths of life and business they may follow.

Personal visits, in many cases several times repeated during the last 20 or 30 years, to upwards of 60 of these continental botanic gardens from Barcelona and Palermo to Upsala and Petersburgh, from Paris and Brussels to Constantinople and Odessa, have led us to take much interest in the question of the real objects and practical working of these establishments. Watching such accounts of them as appear more especially in the German journals, official reports or extra-official complaints, we have been led to an examination of the causes why, notwithstanding the recognised utility of many of them, there are yet others which appear far from answering the expectations entertained respecting them as helps to useful instruction in medical or general botany.

One of these reports, recently published in the "Botanische Zeitung," that of Professor H. Hoffmann on the garden of the University of Giessen in Hesse-Darmstadt, contains more than usual of statistical detail, accompanied by an explanation of the principles laid down for its management, which might be usefully consulted by directors of other continental establishments much more liberally supplied with funds. This is not indeed one of the 60 gardens above mentioned, and we have no personal means of attesting that the directors' rules are practically carried out. But as the report appears to be fairly drawn up, without the usual desire to show off the garden, a condensed summary is given in another column as conveying an idea of what are the ways and means which the directors of the gardens of the minor universities have to work with.

Leaving out of the question such large establishments as the Botanic Gardens of Paris, Berlin, Petersburgh, Vienna, &c., where we every now and then hear of splendid outlays (not even then always backed by corresponding annual expenditure), the universal complaint at all these gardens is want of funds. But is the best use always made of the funds which they have? Are not sometimes the main objects interfered with or entirely lost sight of in the vain attempt to supply commercially the deficient means? And is there not, generally speaking, a desire rather to do much than to do well?—to crowd into the smallest space every variety of arrangement, scientific or practical, that has been thought of in the most magnificently appointed establishment, and above all to swell their lists with as large a number of names as possible, without caring for the reality or correctness of these names, or for the value or worthlessness of the articles represented? These are topics upon which it may be useful to enter into some further details. *G. B.*

New Plants.

131. Rhododendron Brookeanum. *Low in Journal Hort. Soc.*, iii. 82.

We have ascertained that the beautiful golden yellow Rhododendron which has been lately exhibited by Messrs. Veitch is one of those of which figures were published some years since in the Journal of the Horticultural Society, from materials sent to England by Mr. Low, jun. The drawing, however, represents the species with wider leaves than has been observed in cultivated plants, or even in the dried native specimens in our herbarium; so that we must conclude either that the foliage is variable or that the cultivated plant is not able to produce the perfect form of its leaves. The latter are bright green above, pale green below, and unstained with other colour; but according to drawings sent home by Mr. Low, there is a supposed variety with fiery red flowers of a much larger size, and leaves stained with red at the edge.

The ovary of this species, not mentioned in the Hort. Soc. Journal, is tomentose, 5-celled, with a large 5-lobed stigmatic surface (stigma) lying in the centre of a very conspicuous cup (indusium or termination of the carpellary organism). Botanists will understand the value of this fact.

The following account and figure are borrowed from the work above quoted:—

"This noble plant not only grows on trees but, according to one of Mr. Low's memoranda, is occasionally met with 'on Moss-covered limestone rocks, flowering from November to July.' Another note upon it is the following:—'I shall never forget the first discovery of this gorgeous plant; it was epiphytal upon a tree which was growing in the water of a creek. The head of flowers was very large, arranged loosely, of the richest golden yellow, resplendent when in the sun; the habit was graceful, the leaves large. The calyx of this and the other Borneo species is so small as to be scarcely perceptible. The roots are large and fleshy, not fibrous as those of the terrestrial Rhododendrons. It is the least common of all the genus in the island, and has many varieties, which differ in having larger flowers and leaves; the former of a more or less red colour. Very high and large trees in damp forests are its favourite haunts.'

"In his 'Sarawak' we find it mentioned in the following paragraph:—'The still river, winding its way amidst the limestone, which is shaded with overhanging trees, is nevertheless very pretty; and the hill opposite to which we now lie rises in a precipice 200 feet above our heads, its face being covered with climbing plants, and the projections of the rocks clothed with Ferns and other plants, among which I observed the bright flowers of the beautiful and new yellow *Rhododendron Brookeanum*, and the elegant Fern-like foliage of a large-leafed stemless Palm.'—P. 374.

"This species is allied to *R. javanicum*, from which it differs in having larger flowers, and nearly sessile, not long-stalked, leaves, the under side of which is entirely destitute of the rusty specks which characterise the Java plant. Coloured drawings of two varieties are before me—one yellow, the other rich red. The yellow is represented with 14 flowers in a loose cluster, of a rich buff colour, and 2 inches across the limb. The colour, however, is stated by Mr. Low to be incorrect, and it is probably much too dull. The annexed cut represents this variety diminished. The red has larger leaves, and only five flowers in a cluster, in colour resembling the *Azalea indica lateritia*, but richer. They are more than 3 inches across the limb.'

VEGETABLE PATHOLOGY.

No. LXXVI.

325. Senectus (*Old age*).—This is of all complaints to which organic beings are subject the most formidable and unavoidable. Vital structures have to a certain extent a power of reparation, and by judicious treatment dissolution may be deferred; but it is only for a short period; the vital energies sooner or later become impaired, the tissues thickened or consolidated so as to be unfit for their functions, and in the absence of all other disease death at length ensues by their gradual cessation.

326. The more independent each individual is, and the more complete the separation of new individuals from the parent stock, the more palpable are the effects of age. Both in the animal and vegetable world, where each individual is perfectly independent, the functions of life are limited within certain fixed bounds. The minute mould or day-fly, though differing so greatly in degree of organisation, springs up, full life in the morning, and has passed away before the sun has set. But in either kingdom again, where there is an external growth of new individuals, though they may be closely connected for a time with the older portions of the common mass, life may be prolonged almost indefinitely, as in the giant madrepores, or the primeval Oak. The annual and biennial plant ends its course with the perfection of its seed crop, while the Oak may yield its harvest for a thousand years with little decrease of fertility.

327. There are, however, unequivocal testimonies that even these aged relics of times long past are obliged to submit at last to the general law. According to the supply of nutriment in the soil, or in proportion to other favourable circumstances, is the time during which full vigour is retained in every part without flagging. The topmost branches are the first to give way, so that the tree presents at length a dead top, while the surrounding branches are in full vigour; contemporaneous with the failure of the top, and often in consequence of it, the central portion of the wood decays, letting in the wet, and communicating the taint to the surrounding rings of newer tissue. The decayed matter, consisting of humates and ulmates, is not however confined very rapidly outwards. Vegetation proceeds with almost as much vigour as ever; the fruit still comes to perfection; a new ring is added with every new year, and we have thus after a series of years a hollow trunk, long

which almost the whole of the central wood and harder tissues have gradually vanished, though there is life without. The shell at length is too thin to bear the weight of the branches, which in consequence give way; a fresh ingress of moisture leads to further decay, till after a thousand years' growth, a mere tuft of leaves * may be left, testifying that the struggle between life and death is still undetermined. The same process goes on in many other trees, the decay when once commenced being accelerated by boring insects, and the larger fungi. In many cases decay is far more rapid than in the Oak, from the facility with which the putrefactive ferment penetrates the neighbouring tissues. In most cases it is greatly accelerated by the large fungi which find a fitting matrix in the decaying matter, and rapidly exhaust the languid and almost exolete tissues which surround it. It is curious that in many instances the highest part is the first to suffer, as though the first sign of failing vital energy were a difficulty in conveying the nutritive fluid to the extremities, presenting thus a marked coincidence with phenomena common in extreme age to the most long-lived being in the animal world ;† and this failure of the extremities is quite independent of and distinct from the decay of multitudes of branches which takes place even in the most vigorous trees. If every shoot which is produced retained its vitality, the tree would be a crowded mass utterly unfitted to perform its functions, but by a sort of natural pruning those shoots which were originally weaker give way to their stronger and more vigorous neighbours, or decay from want of proper exposure to light and air; or from their want of vigour are less able to resist the cold. Though, however, this decay is often a sign of old age, it is sometimes due to other causes, as peculiarities of soil, as, for instance, where nourishment is abundantly supplied, until the roots penetrate into some barren or noxious stratum, or where they reach some impervious matter, having exhausted the nutriment in the superincumbent soil. In this case the effects are the same with those of direct old age, which indeed may be said to have come on prematurely. When once there is decay amongst the upper branches, the quality of the timber is sure to grow worse every day, and the only safe course is at once to fell the tree. Where the affection is general after the trees have attained but small dimensions, it is best to destroy the plantation altogether, and apply the land to some more profitable use.‡ *M. J. B.*

GARDENERS' ROYAL BENEVOLENT INSTITUTION.

The twelfth anniversary of this charity was held at the London Tavern on Monday last, the 11th inst., Sir S. M. Peto, Bart., in the chair, supported by Sir Joseph Paxton, M.P., E. L. Betts, Esq., A. Rowland, Esq., J. H. Schröder, Esq., Thos. Moxon, Esq., Henry A. Hunt, Esq., R. Wrench, Esq., E. Purser, Esq., H. G. Bohn, Esq., G. Reed, Esq., J. J. Mechi, Esq., and about 120 nurserymen and gardeners.

The usual preliminary toasts were proposed and responded to. The chairman then proposed the health of the Duke of Devonshire. Sir Joseph Paxton returned thanks. He afterwards proposed "Success to the Gardeners' Royal Benevolent Institution," and made a warm appeal to the company in its behalf, hoping that they would show by their subscriptions the interest they took in the charity. Sir Joseph Paxton proposed the "Health of the Chairman;" and after some other toasts were drank, the Secretary announced, among many others, the following subscriptions which had been handed in on the occasion.

	£.	s.	d.		£.	s.	d.
The Duke of Devonshire	21	0	0	Mr. Rivers	6	6	0
Sir S. M. Peto, Bart.	10	10	0	Minier, Nash, & Nash	5	5	0
Sir Joseph Paxton ...	10	10	0	Messrs. Lee	5	5	0
Edw. L. Betts	10	10	0	Alex. Rowland, Esq.	5	5	0
C. Dixon, Esq.	10	10	0	Henry G. Bohn, Esq.	5	5	0
Mrs. Deacon	10	10	0	Henry A. Hunt, Esq.	5	5	0
Miss Schröder	10	10	0	Robert Field, Esq. ...	5	5	0
Baron Rothschild ...	10	10	0	Messrs. Wrench & Sons	5	5	0
J. J. Mechi, Esq. ...	5	5	0	Mr. S. Thompson ...	5	5	0
Mr. Milner	10	10	0	Messrs. Gray & Ormson...	5	5	0
Mr. Eyles	10	10	0	Messrs. Veitch & Son	5	5	0
R. Low, Esq.	8	8	0				

The Chairman then proposed the health of the Stewards, which was responded to by Mr. Nash, and after two or three other toasts the meeting separated.

We may add that the room was tastefully decorated with beautiful specimens of Pelargoniums and other plants, brought there for the occasion by Mr. Turner and Messrs. Henderson and Fraser at their own expense. There was also a plentiful supply of fruit from Trentham, Chatsworth, Arundel, Somerleyton, Preston Hall, &c.

THE GIESSEN BOTANIC GARDEN.

The Botanical Garden of the University of Giessen was first laid out by Dr. Jungermann, in the year 1609, two years after the foundation of the University itself. In the year 1617 it was removed to its present site on the north-east side of the town, within the town walls. In the years 1824-5 it was enlarged by the addition of a shrubbery or promenade called the Herrngarten, and of a portion of the glacis beyond, obtained by the demolition of the city walls, so as to acquire its present dimensions. It now consists of 10¾ Hesse-Darmstadt morgens, or about 6⅔ British acres.

The funds for its support consist solely of the annual grants voted by the States and granted by the Government, as no sale of plants is allowed. These annual grants have for the last seven years (from 1848 to 1854) varied from about 1300 to about 2100 florins (105*l.* to 170*l.*). In the ten preceding years they seldom exceeded 100*l.*, and before that they were usually under 80*l.* All payments are made on the director's written order.

The direction is entrusted to the professor of botany for the time being, under the superintendence of the administrative council of the academy. In the commencement of the present century his emoluments consisted of a salary of 300 fl. (about 24*l.*), besides corn, wood, hay, and poultry, delivered in kind, which the professor either consumed or sold, and of the students' fees. The present amount is not stated. Among the professors named are Jungermann, the founder; Wilbrand, from 1817 to 1846; and A. Braun, the present distinguished professor at Berlin, who was a twelvemonth at Giessen before the appointment of H. Hoffmann, the present professor *; Rupp, Dillenius, and Borkhausen, who are among the best known botanists educated at Giessen, never professed there.

The head gardener with the title of University Gardener has a salary of 500 florins (about 40*l.*) direct from the university fund. He is allowed an assistant at 250 florins (20*l.*), and two day-labourers in winter, and as many as seven in summer, at a daily pay of 34, 30, and 22 kreutzers severally (11½*d.*, 10*d.*, and 7½*d.*).

The original or front portion of the garden, close behind the lecture-room, contains the plant-houses; the middle portion (the old promenade) is still a plantation; the hinder garden eastward is laid out for the cultivation of hardy plants. To vary the exposition a large mound was raised in 1825, forming at the same time a pond and a marsh. The herbaceous beds are planted according to the natural system with perennial, chiefly officinal plants; there are also beds for annuals, for biennials, and some miscellaneous ones. In 1851 Professor Braun established a shady quarter for Rhododendrons, &c., which has proved successful. An alpine collection was formed in 1852 on the north-east side of the mound. There are also a border for Orchideæ strewed with limestone, a bed for wild Roses and other shrubby Rosaceæ, for Liliaceæ, for Ferns, for Evergreens, and in 1854 an *œconomico-technicum* was planted with specimens of the more important herbaceous plants of central Europe which are used in the arts or for food. Moreover beds of showy flowers are scattered about for ornament.

There are three plant-houses: the oldest, attached to the gardener's house, was a narrow glazed passage, in which a number of tropical plants were already cultivated in 1788. It was enlarged in 1824 to its present size, and divided into three portions, of which the central one is a hothouse with some fine specimens of Dracæna, Papyrus, Chamædorea, Scitamineæ, Maranta zebrina, Rhaphis, Phœnix, Chamærops, &c. A second house was built in 1826, and filled in 1827; it is also in three compartments, in the centre one of which is perhaps the finest specimen of Ficus elastica in Germany. In 1836-7 a low pit was added, and first heated in 1851. It is used for tropical Orchideæ, &c., and includes an aquarium consisting of a large wooden vessel sunk in the bed, and containing a few hothouse aquatics surrounded by tropical Ferns. The houses contain also a Ward's case and a propagating frame. All the beds are filled with sawdust, in which the pots are immersed. The heating of the two last-mentioned houses is by hot water in copper pipes, which has answered admirably during the two last severe winters. The flues, on the contrary, of the older house are badly constructed, and not only require frequent repair, but injure the plants by the escape of smoke. The houses are generally too high and dark, being lighted only from the S.E. and early shaded by the high buildings adjoining. For this cause many plants will not blow, and others (such as the Australian Acacias, Mimosa pudica, Astrapæa, &c.) set no seed. The same want of light is felt for the hotbeds, which are, moreover, made of sandstone instead of wood, and are anything but warm. The garden is allowed annually 24 loads of dung from the university stables.

The garden is exclusively devoted to the cultivation of plants of scientific worth or for ornament. Their number, according to the general catalogue, is at present (March, 1855) 4500 species, of which 4217 are Phanerogams. These plants are obtained—

1. *By Exchange of Seed.*—The garden is in correspondence with the greater number of similar establishments on the Continent. In 1855, seed lists have been sent to 42 public and to many private gardens, and lists of desiderata received from 36 establishments. This interchange began about 30 years since. Unfortunately it does not supply what it ought to do, the seeds received are often old or unsound; species really wanted seldom occur among them; whilst a number of worthless fill-gaps are repeated in most catalogues year after year with wearisome uniformity. Lastly, very many of the seeds turn out to be different from what their names import. But little pains is generally bestowed on the determination of plants; the only attempt is to increase the number with perfect indifference as to whether the articles themselves are valuable or worthless, true or false. The correction of names in the Giessen garden is in progress, and for the great mass will be terminated in a few years.

2. *By purchase*, on which are expended annually from 16 to 20 florins (26*s.* to 32*s.*)

3. *By excursions* in the neighbourhood and journeys to a greater distance, as for instance into Switzerland.

4. *By presents*, to which the garden owes the best of its contents. In some recent journies, of which the Government defrayed the expense, the University gardener Weiss brought as presents many valuable exotics from several of the German and Swiss capitals. Other donations are recorded from Dr. Juritz of the Cape, Prof. Liebig, Dr. Sundheim, &c.

The leading principles adopted as to the plants cultivated is a limitation to the extent of the borders, and especially to the number of species; but, on the other hand, so far as the funds will allow, the greatest attention is bestowed upon raising of vigorous specimens, and their good cultivation; few but good and useful species, weeded out with great care; but those that are left maintained in the best state and in a sufficient number of individuals to answer the end sought for—aid to instruction; and this whether they be in the houses or in the open air. Thus the garden keeps ordinarily 14 or 15 specimens of the Cotton and eight of the Tea plant. And as to the use of the garden, the rule is to give the greatest possible accessibility to everything the garden possesses. Since this has been adopted experience has shown here, as at Kew, that the garden far from being thus exposed to robbery is only the better for publicity, by the opportunities it gives for improved correspondence, and by the increasing number of visitors who take an interest in it.

The garden is open to the public the whole day with the exception of the dinner hours (from 11 till 1), the plant-houses on Wednesdays from 1 till 2. It is subservient—

1. *To Self-instruction.*—With this view the old numbers attached to the plants have within the last few years been replaced by their names written in black upon white metal, or in the case of plants in pots, the names are written on the pots themselves in black lead upon a white ground painted in oil. Since this has been done students may be seen in summer, almost daily, book in hand, occupied amidst the borders. The majority of the plants in pots are, as elsewhere, brought out of doors in summer, and the greater number arranged in groups, which it has been the endeavour to render as instructive as possible with designating tablets. Thus, in 1852, were established groups of New Holland plants, Coniferæ, succulent plants, Fuchsias, Ericaceæ, Cacteæ, and Pelargonia; in 1853, African succulent plants opposite the American ones, tropical groups, characteristic Mediterranean plants, herbaceous and ligneous forms from one and the same family contrasted; in 1854, an Orangery, chief types of monocotyledons, the Alpine flora, types of the flora of the coal formation, &c. These groups attract, more especially, the attention of the public, and by their arrangement, the position of the garden-seats, &c., afford very inviting resting-places.* The garden takes part also in the Horticultural Exhibitions, which are held sometimes in the large hall, and sometimes in the Riding School of the University.

2. *To Public Instruction.*—For this purpose, for all lectures on morphology and on the natural orders, a sufficient number of specimens is provided (of four or five species each lecture) to give one to every student before the lecture. They are calculated to serve, after having been examined during the lecture, for forming afterwards for each of the audience a small specimen herbarium of the chief types of the natural order. It required many years before it became possible to accommodate the collection to this system. The garden supplies also for each lecture characteristic specimens of typical groups of plants in pots, such as Cacteæ, Coniferæ, Orchideæ, Proteaceæ, Ericaceæ, &c. Unfortunately the want of a proper lecture-room is on these occasions much felt.

The botanical audience consists almost exclusively of medical and pharmaceutical students; foresters and financial students generally attend the lectures on forest botany, which are supplied with materials partly also from the botanical garden, but mainly from the forest-botanical establishment, lying at a distance from the town, and planted in 1825. The greatest number who have attended the botanical lectures within the last 30 years has been 47. If we consider that this number of instructive specimens must be supplied of all the more important plants, the above-mentioned principle of restriction in the number of species attempted to be grown will be fully justified. We have already succeeded in providing in sufficient abundance many which we much wanted, such as Rice, Lobelia inflata, Gratiola, Gentiana lutea, &c., and we shall soon have enough of Coffee, Cotton, and several others. Some which only flower in winter—such as Tea, Ipomœa purga, Helleborus niger, &c.,—are then dried in sufficient numbers to distribute to the students at the lectures; so also in the case of Mosses, Lichens, &c.

The garden possesses, moreover, a small Herbarium, arranged according to the natural system of which Professor Wilbrand's, containing 5700 species, chiefly

* The Oaks at Morehay Lawn, in Northamptonshire, were certainly of full growth in the reign of King John. Specimens may be seen there in every stage, from full maturity to extreme decay. I have myself watched one year after year, till it produced at last a mere tuft of leaves, from an active eye near the base.

† This appearance in trees is what is called popularly stag's head, and is identical with what is named in France *couronnement*.

‡ In my own neighbourhood there are whole woods where the Oaks are uniformly stag-headed. Some of these have lately been grubbed up, and the produce of corn has been extremely good. Such woods do not pay the expenses in their natural condition, and are valueless except for the production of game.

* Professor Baumer (who died in 1788) used to go out botanising with his pupils, all, as was then the custom, in bag-wigs and swords; one day in an excursion on the Bieber, they were set upon by the peasantry, who mistook them for a band of robbers which then infested the neighbourhood.

* The great taste displayed in the arrangement of the greenhouse plants when brought out of doors in summer, is especially observable in several of the German gardens.

garden plants, formed the basis, to which have been gradually added various private donations, amongst which may be mentioned a *Herbarium normale* of the Hessian flora, formed by the present director, and a general collection of duplicates from the Grand Duke's private herbarium, presented by him to the University. There is also a small museum of fruits, seeds, wood specimens, monstrosities, and botanical curiosities; a library, containing but very few works of any importance; an excellent microscope, by Keller, of Wetztlau, purchased in 1853, and a set of meteorological instruments. The meteorological observations are regularly made and published in the "Proceedings of the Upper Hessian Society of Naturalists and Physicians;" "For," observes Professor Hoffmann, "public botanic gardens are peculiarly adapted for making these observations, both as to locality and the necessary *personnel*, and no one is so dependent on weather as the gardener."—(Abridged from Professor H. Hoffmann's Report in Mohl and Schlechtendahl's *Botanische Zeitung*, April 1855). *G. B.*

Home Correspondence.

The Mangosteen.—Having resided for some years in a tropical country not many degrees from that where the Mangosteen flourishes, I am induced to mention the idea entertained there, that it will only prosper within 3° of the equator. I have seen the fruit produced in Ceylon, but which was said to be very inferior to that in its native clime. Greater skill in gardening might perhaps have had better success. There is however another fruit, I believe a native of Java, which bears freely in Ceylon, and which, if it has not yet been cultivated in England, would be well worth trying. The Rambutan, the only name for it with which I am acquainted, is a pretty plant as to foliage. The fruit grows in bunches. The shell or rind bright red and rough, almost prickly; and when that is opened, the *fac simile* of a plover's egg prepared for aspic jelly presents itself, and is of a very pleasant sweet acid. *Constant Reader.* [The so-called Mangosteens of Ceylon and of the Ghauts are not Mangosteens at all, but merely inferior species of Garcinia. The Rambutan is very nearly the same as the Litchi; no doubt it ought to be tried here, and so should the Lansch and Duku.]

Mistletoe on the Oak.—From an article in your last number there appears to be still a doubt as to the fact of the Mistletoe growing upon the Oak-tree. I remember having seen it once, and but once, growing upon that tree. Having (about 17 years ago) occasion to walk from Glanusk Park, in Breconshire, to Abergavenny, I took the foot-path along the bank of the Newport and Brecon canal, and in the course of my walk was most agreeably surprised at finding an old Pollard Oak completely covered with Mistletoe. I took great pains to examine the tree, and I am quite satisfied of the fact. I do not at this distance of time recollect the precise spot, but any gentleman residing in that locality who has leisure and would feel sufficient interest in the case, might set the matter at rest by procuring a portion of the tree with the Mistletoe growing upon it and sending it to your office. The Mistletoe grows plentifully upon the Apple tree in Breconshire. *T. Ann, Redland Court, Bristol.* [We should be very much obliged for such a specimen of the Mistletoe on Oak.]

Spring Protection of Apricots.—Allow me to correct a misprint in my communication of the 28th May. I should not have troubled you about it had not "G. W." accused me in common with another correspondent of "coddling." My words were, "In 1853 I used double netting as a protection." Double mats, in my opinion, are a worse than useless protection for Apricots, and I think that if the foliage is kept healthy and the trees divested of all unnecessary wood, so as to allow what is left to get perfectly ripened, a better crop of fruit will be produced without protection than can be had from badly matured wood, as is often the case, protected on the most approved principles. *John Stevens.*

Epidendrum bicornutum.—This truly fine Orchid is so seldom seen in perfection at our metropolitan exhibitions that I am led to infer its cultivation must be insuperably difficult. I will, therefore, endeavour to lay before your readers the method I have adopted with it, and which I am happy to say has proved successful. In the first place, I will just mention the climate of the country from which it has been introduced; and then recur to the treatment it should have in an Orchid-house. If we take into consideration the climate of Guyana (Guiana of some), Trinidad, and other places from whence it comes, we at once see the treatment it requires. Its natural habitat, I am credibly informed, is upon rocks and stumps of old trees, contiguous to the sea; and is constantly washed with salt water, particularly when the tides are high; which is very different treatment from what it receives in England. Guyana possesses two rainy and two dry seasons. The long rainy season sets in about the middle of April, and torrents of rain descend until June, when the long dry season commences, and continues to November; December is generally showery, and in January much rain falls. February and March constitute the short dry season. The mean temperature of the year, according to Mr. Thompson's invaluable tables published in the Journal of the Horticultural Society, is 81° 38′; which is not so high as might reasonably be expected, considering the position of the island to the equator. The trade winds, which cross the Atlantic, probably reach the coast impregnated with moisture which no doubt keeps the temperature comparatively low. Having described the climate, I will now make a few remarks upon the cultivation of this plant. It should be potted in a compost of good fibry peat, plentifully intermixed with soft sandstone and river sand, and then suspended close to the glass. As soon as it commences growth it should be well supplied with tepid water, and occasionally syringed with salt water, or, what is preferable, fill a pan with salt water and suspend it immediately under the plant; the saline vapour constantly and gradually ascends, and it is surprising to see the effect it produces upon the constitution of the plant. During winter the temperature and dryness of the air should be considerably reduced, but not to the extent generally recommended by some writers upon Orchids. There are many other very fine Orchids, which are seldom seen in perfection, and upon which I may at some future time offer a few remarks. *H. M., Axmouth, Devon.*

Hardiness of the white Indian Azalea.—It may interest some to know that I have four plants of Azalea indica alba in very fair blossom, which have stood in my garden on the borders of Kent and Sussex without any protection for the last seven years at least. They have been planted among and treated like the common Rhododendrons and Azaleas. *W. C. M.*

Grape Growing (see p. 389).—I should advise "M. K." to get some information on this subject by visiting the numerous houses recently built by gentlemen, whose gardeners have shown more practical knowledge than "M. K.'s." Having been permitted to examine a great many houses, I have not seen anything to equal one built about three years ago at North Frith, near Tunbridge, by Sir Jasper Atkinson, whose gardener, Mr. Webb, very kindly gave me every information how he has been enabled to secure this season such an extraordinary abundance of six different sorts of Grapes in so short a period. I would recommend "M. K.," and in short, any person who feels an interest in these matters, to pay him a visit; it would fully compensate his trouble; the inspection would not only gratify him, but he would obtain some useful and practical hints on the subject of Grape growing. *A. B., County of Kent.*——Your correspondent who has "waited 12 long years for Grapes and had only two bunches about three years back," would have been doing an act of justice to himself and to all connected with horticulture if he had taken your advice "discharge your gardener" nine years ago. If he had done so it might perhaps have been the means of putting a stop to so many garden labourers setting themselves up as gardeners, and doing what no one who had served a regular apprenticeship would do. Perhaps "M. K.'s" gardener is one of that sort. *O. P.*

Fern Judging at the Crystal Palace Show.—I observe (see p. 389) that Mr. Chitty, of Stamford Hill, finds fault with the judges of Ferns at the Crystal Palace. He is of opinion that certain beautiful collections of hardy Ferns there ought to have been disqualified because they contained several of our rare and most beautiful native species which he declares are not hardy enough to bear exposure to our climate, at least that of London. Now every experienced cultivator knows that many herbaceous plants (which everybody calls hardy), including Ferns and Alpines, will not bear this test, and it is mainly owing to the very varied and humid climate of the British Islands, that our flora is comparatively rich in Ferns. It is quite clear that three out of the four exhibitors in question were of the same opinion as the judges about the propriety of calling our native Ferns hardy. The collection which Mr. Chitty patronises was not overlooked, but examined and found to be wanting, both as regards good cultivation and choice species. Let us hope that the exhibitor of it may be more successful next time. *A. S., One of the Judges.*

Nursery Names of Plants.—We notice, at p. 389, a complaint from a correspondent that the same plants are frequently sold by different nurserymen under different names, and referring particularly to the case of a "Maranta" exhibited at the late Crystal Palace Show by Messrs. Jackson of Kingston, Messrs. Rollisson of Tooting, and ourselves. We join most heartily in repudiating the system of nurserymen or any other persons not duly qualified giving fancy names to newly imported introductions. We appeal confidently to Dr. Lindley and Sir W. J. Hooker if it be not our custom to submit to them our new plants for naming, so that there may be no confusion, and that plants of our own introducing at least may not, as far as it is in our power to prevent it, be sold out under different and erroneous names. In this particular instance we made a point of getting from Sir W. J. Hooker the name under which we showed the plant, viz., Maranta roseo-lineata, variety elegans of Kew Gardens. Sir W. J. Hooker does not consider it a species but merely a fine variety of M. roseo-lineata. It may be, and no doubt is, all very well for persons who raise Hybrid Geraniums or Fuchsias, or indeed any kinds of cross-bred plants to name them Queen Victorias, or Almas, or any fancy name they like, but we join your correspondent in repudiating imported plants being sold out under names not sanctioned by botanical authority. We have thought it right to explain our authority for the name we used on the occasion referred to and leave the other nurserymen named by your correspondent to do likewise. *James Veitch & Son.*

Societies.

Royal Botanic, Regent's Park, *June 13.*—This Society's second exhibition took place on Wednesday last under rather unpropitious circumstances as regards weather, heavy rain falling at intervals during the whole afternoon. The exhibition itself was in all respects a good one. Stove and greenhouse plants were abundant, and the same may be said of Orchids, Roses, too, were excellent, and of Pelargoniums, Fuchsias, and other florist flowers there was a large display.

Of Stove and Greenhouse Plants, Mr. May, gr. to H. Colyer, Esq., sent a collection, whose distinguishing feature was its beautiful examples of Allamandas and Dipladenias. These were in admirable condition. It also contained some well-managed Everlastings, a famous Pimelea decussata, Dracophyllum gracile, the blue Leschenaultia and a pyramidally trained Stephanotis floribunda. Mr. Barter, gr. to A. Basset, Esq., of Stamford Hill, also had a good group, in which were Phænocoma proliferum, well grown, but with no open flowers on it; Stephanotis floribunda, Pimelea decussata, a very fine Statice Holfordi, together with Vinceas, Franciseas, and other plants. From Mr. Green, gr. to Sir E. Antrobus, Bart., came good specimens, among which the more remarkable were Polygala Dalmaisiana, Pimelea spectabilis, Aphelexis purpurea macrantha, the yellow Azalea sinensis, the glowing red A. optima, and Rondeletia speciosa.

In collections of 12 Stove and Greenhouse Plants, Messrs. Fraser contributed Phænocoma proliferum, Pimelea Hendersoni, the fine variety of Erica tricolor called Wilsoni, Adenandra fragrans, and a charming Stephanotis floribunda. Messrs. Rollisson had Gardenia Fortuni beautifully flowered; Mitraria coccinea, finely grown but not well flowered; some admirable Cape Heaths, and Acrophyllum venosum. Mr. Cutbush exhibited two well bloomed Everlastings, Pimelea spectabilis, Dipladenia crassinoda, and the Cavendish Heath. Messrs. Pamplin also sent a group in which the most attractive plant perhaps was Stephanotis floribunda.

In the class of 10 Stove and Greenhouse Plants Mr. Frost, gr. to E. L. Betts, Esq., had the best group. It contained a lovely Echites splendens, also excellent plants of Allamanda cathartica, Polygala Dalmaisiana—one of the best of the genus—a well-flowered Kalosanthe, and Statice Holfordi. Mr. Taylor, gr. to J. Coster, Esq., produced small, but well grown plants of Boronia pinnata, Pimelea Hendersoni, Leschenaultia formosa, Dipladenia crassinoda, the pretty Azalea Iveryana, and an Everlasting. Mr. Peed, gr. to J. Tredwell, Esq., sent a white Vinca, a Cape Heath or two, Clerodendron fallax, Allamanda neriifolia, Gardenia intermedia, and Boronia pinnata.

In collections of 6 Stove and Greenhouse Plants, Mr. Williams, gr. to Miss Traill, of Bromley, furnished admirable examples of Boronia tetrandra, Pimelea decussata, and Allamanda neriifolia, the latter a neat little bush covered with yellow flowers. Mr. Morris, gr. to Coles Child, Esq., produced Aphelexis purpurea macrantha, in good condition; a well-flowered Hoya imperialis, a white Azalea, Vinca rosea, and Kalosanthes versicolor. Mr. Roser, gr. to J. Bradbury, Esq., sent Erica ventricosa magnifica, certainly one of the very best of the class to which it belongs; an Everlasting, Pimelea Hendersoni, and a handsome variety of Chorozema varium.

Tall Cacti were contributed in good condition, and to some extent supplied the place of Azaleas, of which there were only a few plants present, and those much past their best. Of the former Mr. Grix furnished well-flowered plants of Epiphyllum speciosum and Jenkinsoni, Cereus speciosissimus and Egertoni, the latter a handsome small-flowered hybrid. Mr. Mortimer and Mr. Green also showed examples of these showy plants, among which was the white-flowered Cereus crenatus.

Orchids were more numerous, and appeared to better advantage than they did at this Society's exhibition in May last. In groups of 20 plants Mr. Williams, gr. to C. B. Warner, Esq., sent beautiful specimens of Aerides odoratum, Calanthe veratrifolia, Saccolabium guttatum and præmorsum, the lovely Cattleya superba, and the Bearded Lady's Slipper (Cypripedium barbatum). Mr. Woolley, gr. to H. B. Ker, Esq., produced some good Saccolabiums, Dendrobium Paxtoni and formosum, Barkeria spectabilis, a remarkable plant, some Cypripediums, &c. Mr. Hume, gr. to R. Hanbury, Esq., furnished Aerides odoratum, Cattleya ianthina, which as we have said before, is merely a bad variety of C. intermedia; Barkeria melanocaulon, Oncidium pulchellum, some of the best varieties of Cattleya Mossiæ, and Dendrobium Dalhousieanum.

In collections of 16 plants, Messrs. Veitch produced Oncidium ampliatum, the Fox-brush Aerides, Dendrobium anosmum, and formosum; an extremely well-flowered Sobralia macrantha, the best variety of Cypripedium barbatum, two very fine examples of Phalænopsis, and some Saccolabiums. Messrs. Rollisson had large bushes of Sobralia, Dendrobium nobile, Cattleya Mossiæ and Aclandæ; also C. Leopoldi, Phalænopsis grandiflora, Oncidium sphacelatum, Vanda insignis, and Brassia verrucosa, the latter an extremely well-flowered plant of the kind.

In the class of 12 Orchids, Mr. Gedney, gr. to Mrs. Ellis, sent fine plants of Saccolabium guttatum and præmorsum, a very fine white Butterfly plant (Phalænopsis), Aerides odoratum, Calanthe masuca, and handsome plants of Cattleya Mossiæ. Mr. Clarke, gr. to Mrs. Webb, contributed Phalænopsis grandiflora, Aerides affine, Saccolabium præmorsum, Cattleya Mossiæ, and an Oncid. Mr. Keel, gr. to A. Butler, Esq., of Woolwich, sent Epidendrum verrucosum, the yellow Cattleya citrina, Brassia verrucosa, Phaius Wallichi, Dendrobium tortile, and Cattleya Mossiæ.

The best group of 6 Orchids came from Mr. Green,

who sent Dendrobium densiflorum, D. nobile, Aerides odoratum and crispum, Cattleya Mossiæ, and Oncidium divaricatum.

Roses in pots were in admirable condition, and we need not say contributed greatly to the beauty of the show. Messrs. Lane had Coupe de Hebe, Paul Perras, Baronne Prevost, and Chénédolé literally beset with blooms just in perfection; also Souvenir d'un Ami, not so well grown perhaps, but with flowers matchless in point of shape and richness of colour. Messrs. Paul had likewise extremely well managed plants, and so had Mr. Francis; Mr. Terry, gr. to Lady Puller; A. Rowland, Esq.; and Mr. Sage, gr. to W. R. Robinson, Esq. These groups contained some of our most favourite Roses, among which Mrs. Bosanquet, Solfaterre, and Souvenir de Malmaison were conspicuous. Mr. Francis had a collection of well-flowered small plants of R. Devoniensis on the Manetti stock. These, as they deserved to be, were much admired.

Cape Heaths were contributed in good condition by Messrs. Rollisson, Fraser, May (gr. to H. Colyer, Esq.), Williams (gr. to Miss Traill), Frost, Roser, &c. Among the different varieties were tricolor Wilsoni, metulæflora, ventricosa grandiflora (a fine kind), Cavendishi, Bergiana, Westphalingia, mutabilis, Massoni, perspicua nana, and gemmifera.

Of Miscellaneous Plants Messrs. Henderson, of Pine-apple Place, had a collection in which small flowering New Holland and other shrubs were intermixed with Rhopalas and other plants possessing fine foliage, the whole producing an excellent effect.

Of novelty there was little beyond what was shown at the Crystal Palace on the 2d inst. Rhododendron formosum elegans. Veronica Luscombeana, a kind in the way of Andersoni, Embothrium coccineum, and Achimenes gigantea, a sort like picta, came from Messrs. Veitch. Messrs. Rollisson sent Meyenia erecta, and A. Farrie, Esq., of Liverpool, furnished a flowering plant of what was called Rhododendron Keysi, from Bootan. It had clusters of little orange tubular blossoms very much like those of a Manettia on the ends of the last year's wood, the young shoots of the present season extending beyond them some 5 or 6 inches; altogether it looked very unlike a Rhododendron. Messrs. Veitch had a handsome Gloxinia with upright flowers like those of Fyfiana, but white with a carmine throat. It was called Comte de Talleyrand.

Pelargoniums, as might be expected in the middle of June, were produced in large numbers, and generally in fine condition. Among new varieties, *i. e.*, those sent out in the autumn of 1853 and 1854 there were some good flowers. Mr. Turner, of Slough, had Governor-General, Carlos, Omer Pacha, Serena, Zeno, and Majestic. These were all extremely well bloomed plants. Mr. Nye, gr. to E. Foster, Esq., of Clemer Manor, sent nice plants of Attraction, Phaeton, Purple, Perfection, Rosa, Carlos (Hoyle), Pandora (Turner). The first four are of Mr. Foster's raising; Attraction and Phaeton were particularly fine. Messrs. Dobson sent Conqueror, a bright crimson, with dark top petals; Empress, Rebecca, Laura, Gem of the West, and Lucy. The first four are varieties raised by Mr. Beck. Mr. Holder, gr. to Rev. E. Coleridge, Eton College, sent a fourth collection, which contained Fair Ellen, Attraction, Carlos, Mary, Governor-General, and Seraskier.

Of 12 plants (Nurserymen) there were 4 collections. Mr. Turner's were large and striking plants, evenly matched in size, and covered with bloom. They consisted of Topsy, Rosamond, Mochanna, Portia, Esther, Leonora, Achilles, Sanspareil, Virgin Queen, Rosena, Majestic, and Astrea. The two next collections were considered to be equal by the Judges. These were contributed by Messrs. Dobson and Messrs. Fraser. Those varieties shown in good condition, and not in the first collection were Delicatum, Enchantress, Magnet, Vulcan, Magnificent, and Lucy. Mr. Gaines, of Battersea, had 12 plants, which included several of the French spotted varieties.

Of 10 plants from private growers there were many collections; by far the best came from Mr. Nye, gr. to E. Foster, Esq., all the plants in which, with one exception, were raised by that gentleman. It contained Phaeton, very fine, Lucy, Rosa, Queen of May, Ariel, Optimum, Purple Perfection, Enchantress, Eleanor, and Magnet. Mr. Holder had 10 large well-bloomed plants, but they were badly tied and put up; the best plant was Carlos. Mr. Wiggins, gr. to Mr. Beck, sent 10 neat well-bloomed plants.

Fancy Varieties of Pelargonium were also numerous. The most remarkable plant of this class was Perfection, an old kind, shown by Mr. Turner as a single specimen. This was more than 2 feet through, loaded with flowers, and yet in an 8-inch pot. The collection of six varieties by the same grower were also excellent examples of skilful management. These were Celestial, Gulnare, Jenny Lind, Electra, Richard Cobden, and Formosissimum. Messrs. Fraser sent Advancer, Celestial, Queen Victoria, Miss Sheppard, Madame Rosati, and Reine des Français. Messrs. Dobson and Mr. Gaines each exhibited six plants. In the Amateur's Class Mr. Wier sent Formosissimum, Hero of Surrey, Jenny Lind, Princess Alice Maude, Fanny, and Fairy Queen. Mr. Bousie, gr., Stoke Park, sent the next best collection; the plants in which were not large, but they were well bloomed.

Calceolarias.—These were shown in good condition by Mr. James, gr. to F. W. Watson, Esq., Isleworth. Their names were Antoinette Marie, St. Margaret, California, Chieftain, and Duke of Northumberland. Mr. Cole, St. Alban's, sent six nicely bloomed plants, all shrubby, a class that should be encouraged. These were King of Yellows, a fine bright rich yellow; Grandis, in the way of Kentish Hero; Negro, a small rich dark, and three others less attractive.

Fuchsias were shown rather extensively by Mr. Bousie, Mr. Gray, Mr. George, gr. to — Nicholson, Esq., Stamford Hill; Mr. Bishop, South Villa, Regent's Park, and Messrs. Dobson. The two first named collections were by far the best. The finest light varieties shown were Queen of Hanover, Duchess of Lancaster, Miss Haastrey, Pearl of England, England's Glory, and Elizabeth. In dark kinds, Vanguard, Macbeth, Glory, Verrio, and Autocrat were fine.

Passifloras were not very good, the season having now become too far for them. 36 blooms were shown by Mr. Turner. Mr. R. Bryan, Hounslow; and Messrs. Dobson. 24 blooms (private growers) were sent by Mr. James, Mr. Holder, and Mr. Thorpe, Fulham. What are called selfs appear to stand the hot weather best: far superior to the other kinds were Royal Albert, Member, Sovereign, Sir Colin Campbell, Purple Perfection, Uncle Tom, and some good seedlings of self colours.

Show and Florists' Flowers were numerous. The judges awarded the certificates Pelargoniums: Meteora (Foster), a bright orange variety, very fine, showy, and free flowering; Pallas (Foster), rose, with crimson spot, white centre: Quadroon (Beck), a very dark painted or spotted flower, small, but very attractive. There were several others we thought good and new, viz., Admiration (Hoyle), Leopard (Hoyle), and Corsair (Hoyle); also Edith (Foster), and Admirable (Turner). Mr. Turner sen 12 kinds of Seedling Fancy varieties: the best were Beauty of Slough, Masterpiece, Sir J. Paxton, Warrior, Purpureum album, Naomi, Carminatum, and Nonsuch. The judges selected the two first named for awards.

There were several good things in the way of bedding plants, particularly Geraniums. Mr. Kinghorn sent three of the scarlet class, the best being General Pelissier, the others, Countess of Warwick and Annie. Emperor Napoleon, shown by Mr. Butcher, Stratford-on-Avon, is a dwarf good scarlet for beds. Mr. Cole sent several good kinds of shrubby Calceolarias, Compacta, Leo, and a spotted kind, not named, were very good.

Messrs. Henderson, of the Wellington Road, sent a miscellaneous collection of small plants in bloom, containing some new things, amongst which we noticed six plants of the pretty free blooming fancy Geranium Cloth of Silver. This is a free flowering light kind, an improvement on Delicatum. Also six plants of Evening Star, a good shaped sort of the class, but more white than R. Cobden. This is very good.

Of Fruit there was a tolerably good display, but owing to the crowded state of the tent we only found opportunity to notice some of the best of it. Mr. M'Ewen, gr. to the Duke of Norfolk, at Arundel Castle, furnished a collection in which were very good white and black Grapes, Peaches and Nectarines, Melons, Apples in a state of good preservation, red and white Currants, and Raspberries. One of the Melons, a green-fleshed sort, on being cut was found to be extremely good; the Grapes were perfectly ripe and well-coloured.

Of Pine-apples there were nearly three dozen; but among them were no remarkably fine specimens. The best Providences came from Mr. Chapman, gr. to J. B. Glegg, Esq., and Mr. Robinson, gr. to Lord Boston; the heaviest of these, however, as far as we could ascertain, did not much exceed 7 lbs., and we saw no Queens above 4 lbs. The best examples of the last description of Pine came from Mr. James, gr. at Pontypool Park, and Mr. Turnbull, gr. to the Duke of Marlborough at Blenheim.

Among Grapes, Mr. Munro, gr. to Mrs. Oddie, had beautiful bunches of Black Hamburgh, extremely well ripened; Mr. Frost, gr. to E. L. Betts, Esq., also sent fine fruit of this variety; but the colouring was imperfect. Mr. Davis, of Oak Hill, and Mr. Harrison both had good Black Hamburghs; and so had Mr. Dods, gr. to Sir J. Cathcart, and Mr. Slowe, gr. at Bayfordbury. Mr. Tillyard, gr. to the Right Hon. the Speaker, produced good bunches of the same kind of Grape, and so did Mr. Turner, of Streatham. Very fine examples of Black Prince came from Mr. Hill, gr. to R. Sneyd, Esq., Mr. Turnbull, and Mr. Constantine, gr. at Hillingdon. Mr. Turnbull had Muscats, large both in bunch and berry, but not nearly ripe. Mr. Cook, of Tulse Hill, also showed Muscats, as did likewise Mr. Solomon, but the latter were unripe. Frontignans came from Mr. Parr, of Gloucestershire, and Mr. Henderson, gr. to Sir G. Beaumont, Bart.; the latter showed the Grizzly variety. Good Muscadines came from Mr. Williams, gr. to C. B. Warner, Esq., Mr. Ayres, Mr. Tillyard, and Mr. Bailey of Shardeloes; the exhibitions from the two last-named growers were, however, unripe.

Peaches.—Royal George, large and well coloured, came from Mr. Hill, Mr. M'Ewen, and Mr. Brown; and very fine examples of Grosse Mignonne were furnished by Mr. James, from Pontypool Park, and Mr. Tegg, from Roehampton. Mr. Raxton sent White Magdalen. Mr. Fleming, gr. to the Duke of Sutherland at Trentham, had Murray Nectarines, large and in every way excellent; and Mr. Ayres sent Elruge.

Of Figs, Mr. Constantine had good fruit of the Nerii.

Cherries may be said to have been confined to a dish of May Duke, large and well ripened, from Mr. Fleming.

Of Strawberries the best came from Mr. M'Ewen, who furnished beautiful dishes of British Queen, Trollop's Victoria, and Myatt's Eleanor. Mr. Constantine also sent examples of British Queen. Among other kinds we noticed Sir Harry, which was so well spoken of last year.

Melons were numerous, and generally speaking we understand good. Among the very best were the Bromham Hall and Golden Drop.

Mr. Williams, gr. to C. B. Warner, Esq., had dishes of Oranges, Lemons, and Shaddocks.

Entomological, *June* 3.—J. Curtis, Esq., F.L.S., President, in the chair. In addition to the various donations of publications presented by the Natural History Society of Ratisbonne, the Royal Society, the Entomological Society of France, &c., an extensive series of beautiful insects from India, selected from a very extensive collection recently formed in that country, was presented by S. P. Pratt, Esq., F.R.S. Among these were many nocturnal Lepidoptera of very considerable interest, including a number of Micro-Lepidoptera and five species of Pterophorus. A certificate in favour of Professor Pictet, of Geneva, as one of the honorary foreign members of the Society was read, and Herr Dohru, President of the Entomological Society of Stettin, was elected a member of the Society. Various interesting Coleoptera and Lepidoptera, collected by Mr. Foxcroft at Loch Rannoch, were exhibited; amongst the beetles was the very rare Dendrophagus crenatus, and amongst the moths was Anarta cordigera, with illustrations of its transformations. A specimen of the splendid new butterfly from Borneo, named after the Rajah Brooke by Mr. Wallace, was exhibited by Mr. Stevens. Mr. Stainton communicated a note by Mr. D'Urban concerning the cocoons of Saturnia cecropia, a species of large size common in Canada, which might easily be collected and employed in the manufacture of silk. Specimens of the cocoons were also presented to the Society by Mr. D'Urban. Mr. Curtis presented, on behalf of Mr. Spence, various interesting insects collected in Ceylon by Mr. Thwaites, including a small species of beetle allied to Polystichus, which he had found with its larvæ in the nest of a small black ant; likewise the pupa of a very small butterfly. Mr. Curtis also exhibited specimens of Langelandia anophthalma, a blind beetle collected near Paris under a water-butt at a considerable depth under-ground, by Mr. Charles de la Rouzée. A paper by Mr. Newman was read upon the rays in the wings of insects considered as nerves, veins, ribs, or tracheæ by previous authors, but which Mr. Newman regarded as simply organs of support analogous to those of the wing of the bat or flying dragon. Mr. Newman's views were opposed by Messrs. Curtis, Westwood, and Waterhouse.

Linnean, *May* 24. Anniversary.—The President in the chair. At the ballot for the election of officers for the ensuing year, Thos. Bell, Esq., President; W. Yarrell, Esq., Treasurer; J. J. Bennett, Esq., Secretary; and Richard Taylor, Esq., Under-Secretary; were severally re-elected: and the following were elected members of the Council, namely—G. Bentham, Esq.; G. Busk, Esq.; A. Henfrey, Esq.; W. W. Saunders, Esq.; and Dr. Seemann; in the place of Drs. Hooker, Thomson, Wight, and Burchell, and F. Walker, Esq. The auditors reported a balance in favour of the Society on the year's account of 38*l.* 10*s.* 6*d.*

June 5.—The President in the chair. Mr. S. Stevens exhibited a splendid new butterfly, named Ornithoptera Brookeana, collected in Borneo by Mr. Wallace. G. E. Dennes, Esq., exhibited fresh specimens of Orchis fusca, collected near Maidstone, in Kent. N. B. Ward, Esq., exhibited flowering specimens of Gentiana verna from Galway, and Cerastium latifolium and Draba frigida from the Dovre range of mountains in Norway; these species, in company with Andromeda tetragona, were flourishing on some peaty banks in his garden at Clapham. The following papers were read:—1. The first of a series of memoirs entitled "Horæ Carcinologicæ, being a paper on Leucosiadæ," by the President. 2. "Notice of a species of Carabideous insect found by G. H. K. Thwaites, Esq., together with its larvæ in ants' nests, in Ceylon," by J. Westwood, Esq.

Notices of Books.

Clark's Mollusca testacea (8vo, Van Voorst, pp. 536), describes minutely in a fair 8vo volume the marine testaceous animals of our islands. For many years Mr. Clark has devoted himself to this subject; he tells us that nearly every animal has undergone, in a living state, his personal examination; that he has had his own dredger, and that few individuals can have had better opportunities of observation than himself. The volume before us bears ample witness to the care and skill with which such opportunities have been employed. It is an invaluable magazine of facts in this department of natural history. We particularly recommend to the attention of our species-mongering friends the following observations, which apply to botany with as much force as to any branch of systematical natural history, and, we fear, to all in some degree.

"Before I give the descriptions of the types of the genera of the Littorinidæ, I will make some remarks on the prevalent practice of naturalists to create species from mere varieties: this anxiety can only be attributed to their wish to extend our knowledge of new and interesting objects. That these views are desirable and laudable cannot be questioned, but it is to be feared that the zeal of these gentlemen, combined with the ardour of rivalry in the race with their brethren in the same pursuits, have been the cause of a departure from those principles and laws which are considered indispensable to arrive at just conclusions in the establishment of genera and species; or, in other words, in laying down the true bases of the differential features of the families, genera and species of a class, so as to enable the student to deposit his objects with certainty in their natural position, and to distinguish them from others, however numerous, of the same family, by concise and well-defined specialities. If these rules were rigorously attended to, we should have fewer complaints of the almost impossibility of identifying many of the objects of natural history. The inconveniences that have arisen from the neglect of these precepts are so great and pressing, that I propose to attempt to point out their origin, and suggest a remedy as far as regards malacology and conchology, and to evidence and illustrate my arguments by references to the present state of certain groups of the Mollusca. If conchologists are determined to form numerous species from the same animal because it happens to present certain shell-variations, they must have their way, but malacologists will not concur with them in giving a dozen names to the same object. These gentlemen cannot escape having the phrase *dies docebit* verified; the day of retractation will assuredly arrive; it will therefore be better for the interests of science and their *amour propre*, at once to apply the remedy for this singular creative monomania,

. . . . 'O medici mediam pertundite venam.'

I apologise for my irreverent quotation, and trust I may claim for this once,

. . . . . 'Liberius si
Dixero quid, si forte jocosius, hoc mihi juris
Cum veniâ dabis.'

"The practice I have just described is fraught with great detriment to the advancement of science, because in many instances it destroys every attempt at identity, and renders our books bulky and expensive by the

insertion of worthless synonyms, which have no existence as objects; and every writer feels obliged to notice all, because he has not the means of separating the rigorously-defined and well-founded species from the pseudo and unsubstantial articles. It results from this false position of the science, that when a student, with his object in hand, consults the authorities, he finds 10 or 12 others so nearly resembling his, that he becomes bewildered in the mazes of distinctions, often without differences, despairs of identifying his object, and perhaps retires altogether from a rational and highly important pursuit, under the idea that the science is full of perplexities, which he, as a tyro, has neither time nor inclination to unravel."

Miscellaneous.

Northern Region of Russia.—"In the extreme north the corn is sowed and reaped in a few weeks. It is remarkable that the further north corn can be made to thrive, the shorter is the period of time in which it comes to maturity; it has also been observed that corn grown in the extreme north, when used as seed in a southern country, gives its first produce more speedily, ripening in a much shorter time, although at a second sowing it loses this quality," p. 347. "The heat and vivifying influence of the sun, and the quantity of organic matter, call into existence a prodigious amount of insect life, which is the case even where the water drowns the larger plants. Clouds of mosquitos, so large and dense that their humming can be heard for many miles, rise frequently into the air like huge columns of smoke. Everywhere in the woods the number of large bluebottle flies and other insects renders one's passage through them quite maddening, and explains why the elk, the rein-deer, and the bear, spend most of the day plunged up to the neck in the pools of the forests, or wallowing in its mire. The further northward one travels, the more annoying these tormentors grow." P. 348, v. 1, 2d edit., 1845.—*Revelations of Russia in 1844, by an English Resident.*

Calendar of Operations.

(*For the ensuing week.*)

PLANT DEPARTMENT.

It is a very common practice in the management of the show-house to huddle the plants thickly together in order to produce a dense mass of bloom; but this should never be done with hard-wooded plants, especially at this season when they are starting into growth, and most things, if they are to be of any farther service, require a fair share of light and air while in bloom. Valuable specimens of hard-wooded things, particularly Heaths, should be frequently examined, turning them partly round in order that their shoots may be equally exposed to the light; and if anything appears to be suffering from confinement, it should be removed at once to more airy quarters. Should the weather continue bright, the beds and borders of this house will require a liberal supply of water to keep them properly moist; and the soil about strong-growing plants should be occasionally examined to see that it is not too dry towards the bottom of the bed, for the amount of moisture absorbed by such things at this season is much greater than inexperienced persons are apt to imagine. Greenhouse.—Now that many of the inmates can with safety be removed to the open plant ground, where they will do quite as well or better during summer than under glass, there will be no necessity for crowding the specimens left; therefore see that every plant stands quite clear, so that all its parts may be fully exposed to light and air. In placing greenhouse plants out of doors, care should be taken not to rashly expose them to bright sunshine, particularly if they are at all tender through having been kept close, or are in a growing state. Indeed, the plant ground should be so situated that the plants will not be exposed to the mid-day sun, for few things in pots will do much good if exposed to the full force of the summer's sun. Stove.—Where this house is principally used to furnish a supply of flowering plants for the summer and autumn decoration of the conservatory, some foresight and care will be necessary in order to have the things in a fit condition for removal to the conservatory when they may be wanted there; for until the weather becomes warmer than it has hitherto been this summer, plants must not be removed from a warm close moist atmosphere to a cool airy house without some preparation. And plants that have been grown in the stove should either be removed to an intermediate house, or placed in the coolest end of the stove.

FORCING DEPARTMENT.

Vineries.—Borders that have been lately uncovered should be carefully examined, and if found too dry give a liberal soaking of good strong manure water from the stable or farm yard tank. It will be advisable however to mix the manure water with sufficient warm water to bring the temperature to from 70° to 90°. Take advantage of bright days to admit air freely where the Grapes are colouring, and avoid moisture in the atmosphere by removing all plants from under the Vines. Attend carefully to young Vines recently planted, keeping the soil about their roots in a healthy moist state, maintaining a moderately moist atmosphere, and shading, if necessary, until the Vines get a fair start. Melons.—Where the fruit is swelling, endeavour to keep the soil in a nice healthy state as to moisture, avoiding either extreme. Give air freely whenever the weather admits, and use every means to preserve the foliage in health. Keep the Vines thin, and prevent their being encumbered with useless laterals, and remove any decaying leaves immediately they are perceived, which, when left, only serve as nurseries for insects. There is yet a fair chance of obtaining a good crop in "dung frames," and if any of the frames which have been used for getting up the bedding out stock can be spared for this purpose, the beds should be made and the plants got in without loss of time. Very little artificial heat will be necessary at present, and the bed should not be made to heat too strongly, otherwise there will be time lost before the plants can be safely put in. The bed should be made high enough, however, to allow of applying a lining, if necessary, later in the season, but this will be easily managed by making the bed some two feet high with any useless material which will not ferment, and placing upon this sufficient well worked stable dung to afford a gentle heat.

FLOWER GARDEN AND SHRUBBERIES.

The weather during the last ten days has been very favourable for the newly planted-out stock and well prepared plants, which have only been planted this time, are rooting into the fresh soil freely, and those who delayed planting out until the first week in June, and were then prepared with strong plants in good condition, will probably have their beds covered before those who planted out earlier; should the weather continue dry and warm, however, the plants must be regularly attended to with water, for it will not do to leave them to take their chance because they have made a few roots since planting out. But daily waterings will not be so essential now that the plants have made some progress at the root, as the increased root action will balance the extra drain upon the system of the plant resulting from full exposure to sun and air; but the soil must be well supplied with water until the beds are fairly covered, by which time, if the soil is deep and open as it should be, the plants will find sufficient moisture in the soil. See that everything liable to be injured by a sudden storm of wind is well secured by pegging, or staking, as may be proper, and keep the surface soil about all recently planted things loose and open by frequent stirrings, which will greatly assist in promoting rapid growth. Where there is a large demand for cuttings for spring propagation, a number of plants of each variety proportionate to the probable demand for cuttings should be selected from the reserve stock, potted in 7-inch pots in light soil, and plunged in the reserve garden. These, with very little attention, will make nice stocky plants in course of the summer, and there is no risk of losing in winter plants prepared in this way, and this can hardly be said of autumn rooted cuttings of many things, and by repotting and placing them in growing circumstances early in spring, each plant will furnish a large number of cuttings sufficiently early to make good strong plants before planting out time. Young specimens of ornamental shrubs and trees which it is desirable to get to grow rapidly should be thoroughly soaked with water at once, especially coniferous plants. A liberal supply during the growing season is more beneficial to such things, particularly specimens on lawns, than is generally understood. In proof of this the authority of Mr. Barron may be cited, and probably no man has had as much experience in the management of out-door ornamental plants, or understands it better; and he regularly practised not watering, but flooding valuable specimens during their growing season, and states that the large Araucaria at Elvaston Castle, which under this treatment had made something like 2 feet of growth a season was altogether neglected with water one year, and made hardly any perceptible progress that year.

HARDY FRUIT AND KITCHEN GARDEN.

Trees that have not got fully established since replanting will be benefited by mulching over their roots, which will prevent rapid evaporation, and keep the soil in a healthy state as to moisture. And the same attention will be useful to trees in shallow borders, especially Peaches and Nectarines, which are very subject to the attacks of mildew if allowed to get too dry at the root in summer. Where it can be procured, a thin coat of half rotten leaves should be used for mulching, and in the case of trees inclined to weakness, a portion of good rotten dung might be mixed with the leaf soil, and would be of great service in strengthening the trees. Do not give up the war upon insects until they are entirely eradicated, and give timely attention to the stopping of gross shoots, &c., on pyramidal and other trees which it is desired to keep in form. Those who are fortunate enough to have a heavier crop of fruit set than the trees are likely to bring to perfection should thin at once, in order to secure fine fruit with a prospect of a crop next season; and in this neighbourhood Apples are set so thickly that without thinning there will be no chance of a crop next season. See that there is plenty of Peas planted for furnishing a late autumn supply, and also attend to keeping up a succession of French Beans, Spinach, and all kinds of salad. Where it can be done Lettuces should be planted on a north border at this season, as it is difficult, without more watering than can always be afforded, to have them crisp and tender in hot weather, unless they are in a cool situation. Sow Onions for drawing young for salad, also Endive for autumn use, and see that there is plenty of Parsley provided to furnish a supply in winter. Keep the soil loose and open among all growing crops by means of frequent stirrings.

STATE OF THE WEATHER AT CHISWICK, NEAR LONDON,
For the week ending June 14, 1855, as observed at the Horticultural Gardens.

June.	Moon's Age.	Barometer. Max.	Barometer. Min.	Temperature of the Air. Max.	Temperature of the Air. Min.	Temperature of the Air. Mean	Temperature of the Earth. 1 foot deep.	Temperature of the Earth. 2 feet deep.	Wind

Average		29.956	29.875	69.7	47.3	58.5	58.6	55.6	

June 8—Cloudy; very fine throughout.
— 9—Fine; low white clouds, with very clear intervals; showery.
— 10—Very fine throughout; cold at night.
— 11—Very fine; dry easterly wind; fine at night.
— 12—Very fine; overcast; clear at night.
— 13—Hazy; overcast; heavy rain in the evening.
— 14—Overcast; rain; fine; rain at night.

Mean temperature of the week 1½ deg. below the average.

RECORD OF THE WEATHER AT CHISWICK,
During the last 29 years, for the ensuing week, ending June 23, 1855.

June.	Average Highest Temp.	Average Lowest Temp.	Mean Temp.	No. of Years in which it Rained.	Greatest Quantity of Rain.	Prevailing Winds						
Sunday 17	73.0	49.8	61.4	16	0.80 in.	1	4	2	[illegible]	[illegible]	[illegible]	[illegible]
Mon. 18	72.7	50.9	61.8	15	0.30	2	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]
Tues. 19	70.8	49.2	60.0	14	0.37	1	3	1	[illegible]	[illegible]	[illegible]	[illegible]
Wed. 20	72.5	50.7	61.6	12	0.21	1	1	1	1	6	[illegible]	[illegible]
Thu. 21	73.9	51.0	62.4	13	0.68	2	3	3	2	1	[illegible]	[illegible]
Frid. 22	72.9	49.3	61.1	12	0.59	2	1	1	1	3	[illegible]	[illegible]
Satur. 23	73.4	49.4	61.4	12	0.44	1	1	3	10	[illegible]	[illegible]	[illegible]

The highest temperature during the above period occurred on the [illegible] and 22d, 1846—therm. 93 deg.; and the lowest on the 17th, 1850, and [illegible] 1851—therm. 35 deg.

Notices to Correspondents.

Books: *J St. J.* We are not surprised at your complaints. A large library is a great inconvenience to a small man. You should do what we do, weed your book-shelves every two or three years, and send duplicates, or old editions, or what are obsolete, to the auctioneer. It is true the price you will get is low, and that there is loss to sustain; but recollect that you have had the use of the books, and the difference between purchase and sale is the price you pay for that advantage.

Diseases: *E E.* Thanks for your second supply of specimens which arrived in good condition. The racemes of flowers are extremely imperfect, and a large proportion of the few scattered buds abortive. The branches have in fact run to tendril. As your foliage is so luxuriant, it is probable that the roots have access to improper nutriment. There is no fungus about your plants, and you must therefore look to other causes. If we are wrong in our supposition you will probably be able yourself to assign some cause from a careful consideration of the circumstances under which the Vines are placed. Since it appears that all the Vines were somewhat overcropped, the abundant fruiting of last year would have equally affected the whole house, and we should scarcely expect such a complete failure from such a cause.—*J B.* There is not the least doubt that the pitting at the lower side of the Melon where it touched the ground is due to the same disease with that which has affected the leaves you sent a fortnight since. The vine attached to the fruit is dead except close to the stalk, but it may have withered since the plant was packed. The brown cavity at the top of the Melon is different from anything we have seen before, and the subjacent flesh is differently affected. In the paler pits the walls of the cells are nearly in their natural condition, but in the brown spot, which resembles the canker of certain trees, the cell walls are greatly thickened and infiltrated with brown matter. It seems to be a distinct disease. Both Melons and Cucumbers should be grown in a good stiff loam, without much admixture of manure. We feel sure that where much manure is mixed with the soil the disease is aggravated.—*H F.* Your Grapes are affected with an aggravated form of rust, like that mentioned a week or two since. Nothing can be done for them now.—*J R M.* Your plant, as far as we can judge from the two leaves, is a variegated variety of Mentha rotundifolia. *M. J. B.*

Eriobotrya Japonica: *R.* This will flower and bear fruit in a common greenhouse if its roots have plenty of room. It may be treated like a Camellia. It flowers in winter time.

Feather Hyacinths: *E H.* Your plant is Muscari comosum, not monstrosum. The latter is a monster of the former, and it appears that in your case, owing to altered soil, the monster has reverted to its natural state.

Guano: *Clapham.* What *can* we say which has not been repeatedly said already. In gardens it is best applied in solution, the insoluble parts being scattered over the borders and slightly dug in. It suits everything which manure suits. Like all liquid manures it should be given in very weak doses, often repeated, while plants are in a state of growth. Upon this point you will find detailed information in the "Theory and Practice of Horticulture," chapter xxi., where 40 pages are occupied by manure.

Insects: *K W.* The insects you have sent are both scale insects of the two sent the white ones are most injurious; they are now full of eggs, and require immediate attention, or your plants will swarm with the active young. Crushing them with the nail is as good a receipt as any.—*A R.* The grub has neither cork nor insect in it when it arrived.—*A Jardener.* Your Peach tree is infested with the large scale insect (Coccus Persicæ): their appearance is in no way attributable to the twine nets, but they are produced from young which were hatched last summer. You must immediately destroy them, or your trees will swarm with the young brood. The ants were engaged in sucking the saccharine matter exuded by the scale.—*Mary Elizabeth.* Your Peach trees are also infested with the large scale. See the preceding reply. *W.*

Names of Plants: We have been so often obliged to reluctantly decline naming heaps of dried or other plants, that we venture to request our correspondents to recollect that we never have or could have undertaken an unlimited duty of this kind. Young gardeners, to whom these remarks more especially apply, should bear in mind that, before applying to us for assistance they should exhaust their other means of gaining information. We cannot save them the trouble of examining and thinking for themselves; nor would it be desirable if we could. All we can do is to *help* them—and that most willingly. It is now requested that, in future, not more than four plants may be sent us at one time.—*J F.* Anagyris indica.—*Tyro.* 1, Spurge Laurel, Daphne Laureola; 2, Daphne pontica.—*A Sub.* We know nothing about Hyacinthus belgicus cœruleus, much less which name we suppose some ignorant dealer has sold it to you. Its real name is Scilla campanulata.—*Constant Reader.* Bifrenaria vitellina.—*M C.* 1, Genista hispanica; 2, Pinguicula grandiflora; 3, Asplenium viride; 4, Jungermannia Blasia.—*R S Yates.* Oncidium crispum.

New Pea: *A Salisbury Paper* tells lately of "experiments being about to be made in several departments of France to naturalize a species of Pea, peculiar to China, which yields both oil and flour. The oil, like Colza or Rapeseed, is used largely for culinary purposes. It is also made into paste, and after fermentation is seasoned with pepper, salt, &c. Every year thousands of junks, freighted with paste and oil, leave Canton for the different parts of the Celestial Empire." Can any one say what this is?

Roses: *G P., London.* Your buds are attached by the fungus called Uredo Rosæ.

Misc.: *R T C.* Your inquiry has no relation to horticulture or rural economy, and we answer no questions except those which have.

PERUVIAN GUANO, Bolivian Guano, Superphosphate of Lime, Nitrate of Soda, Sugar Scum, and every description of Artificial Manures, Linseed Cakes, &c.
WM. INGLIS CARNE, 10, Mark Lane, London.

TURNIP MANURE.—Superphosphate of Lime delivered to any Warehouse in London at 6*l.* per ton.
Professor Nesbit's Analysis given with Invoice.
Apply to CHARLES TOTHILL & Co., Manufacturers, Plaistow Marsh, Essex.

TURNIP SOWING.—The Undersigned beg to offer their valuable Supherphosphate of Lime (See "Royal Agricultural Society's Journal," Vol. VI., Part 2), Turnip Manure, and Nitro-phosphate or Blood Manure.
Also on sale, Guano, Nitrate of Soda, Gypsum, Bone-dust, Sulphuric Acid, Salt, and all other Manures of known value. Agents for the sale of Peat Charcoal.—Apply for Prices Current to MARK FOTHERGILL & Co., 204A, Upper Thames Street, London.

PATENT SANITARY SEWAGE COMPANY'S NITRO-PHOSPHATED CARBON OR BLOOD MANURE, 5*l.* 10*s.* per ton; delivered in London, bags included. Each ton contains 1350 lbs. Blood and 11 per cent. of Phosphate of Lime.—Agents throughout the country.
22, Lincoln's Inn Fields, London.

CORN MANURE FOR SPRING SOWING.
CONCENTRATED URATE FOR GRASS, RAPE, AND ALL ROOT CROPS.
SUPERPHOSPHATE OF LIME.
THE LONDON MANURE COMPANY continue to manufacture the above Manures, which have been used with so much success for the last 14 years.
The London Manure Company also supply PERUVIAN GUANO (direct from importers' warehouses), Nitrate of Soda, Sulphate of Ammonia, Fishery and other Salts, Bone Dust, and every artificial manure of known value. EDWARD PURSER, Sec.
Office—40, Bridge Street, Blackfriars.

THE FOLLOWING MANURES are manufactured at Mr. LAWES' Factory, Deptford Creek:—Turnip Manure, 7*l.* per ton; Superphosphate of Lime, 7*l.*; Sulphuric Acid and Coprolites, 6*l.*
Office, 69, King William Street, City, London
N.B. Genuine Peruvian Guano, guaranteed to contain 16 per cent. of ammonia. Nitrate of Soda, Sulphate of Ammonia, and other Chemical Manures.

MANURES.—The following Manures are manufactured by HODGSON & SIMPSON, Calder Soap Works, Wakefield, and MATTHEWS & Co., Manufacturing Agricultural Chemists, Driffield. SIMPSON'S AMMONIA PHOSPHATE, a valuable Top-Dressing for Wheat, Barley, and Oats. SIMPSON'S NITRO-PHOSPHATE for Turnips, Potatoes, and all other bulbous root crops, price 8*l.* per ton. N.B. Manures specially prepared for Grass and Flax. The above have been successfully tested for the last Seven Years by the leading farmers in Yorkshire and Lincolnshire, and other counties, and were applied last season to a breadth of upwards of 15,000 acres of land with the most beneficial results to the crops. A List of Testimonials and other particulars will be forwarded by post on application.

SEWAGE CHARCOAL MANURE.—This highly fertilising Manure, which is Peat Charcoal completely saturated with London Sewage, will be found most efficient for every species of crop; more especially for Peas, Beans, Turnips, Mangold Wurzel, and other root crops. It will produce a greater return for the outlay than Guano or any other manure at an equivalent value: it also possesses the property of retaining its fertilising power longer than other Manures now in use. It may be obtained at the SEWAGE MANURE WORKS, Stanley Bridge, Fulham, at 4*l.* per ton, and in quantities less than half a ton, at 5*s.* per cwt., for ready money only; and in quantities not less than a ton will be delivered at the London Termini of the Railroads free of charge for cartage. No charge for sacks.
It may also be had from Messrs. G. GIBBS & Co., 26, Down Street, Piccadilly, Agricultural Seedsmen, Agents for London, and from all the other Agents of the Company.

TO ARTIFICIAL MANURE MANUFACTURERS.
TO BE SOLD, from 10 to 15 tons of GREAVES, to sample, at 4*l.* 5*s.* per ton, net cash, delivered at a wharf in the Pool. The sample to be seen and applications made to KINGSBURY & WHITMORE, Advertising and General Agents, 14, Tavistock Street, Covent Garden.—June 16.

UNIVERSITY COLLEGE, TORONTO, UPPER CANADA.
AGRICULTURAL DEPARTMENT.
THE PROFESSOR OF AGRICULTURE, who resides on the Experimental Farm attached to the College, is prepared to receive into his family a small number of Pupils, who will have the advantage of entering on an extensive course of Collegiate Studies in connexion with Agriculture, on very easy terms.—Particulars and References may be obtained of Mr. H. G. AUSTEN, 259, High Street, Borough, London; or by addressing Professor BUCKLAND, University College, Toronto, Upper Canada.—June 1855.

COLLEGE OF AGRICULTURE AND CHEMISTRY, AND OF PRACTICAL and GENERAL SCIENCE, 37 and 38, Lower Kennington Lane, Kennington, near London.
Principal—J. C. NESBIT, F.G.S., F.C.S., &c.
The system of studies pursued in the College comprises every branch requisite to prepare youth for the pursuits of Agriculture, Engineering, Mining, Manufactures, and the Arts; for the Naval and Military Services, and for the Universities.
Analyses and Assays of every description are promptly and accurately executed at the College. The terms and other particulars may be had on application to the Principal.

ARTIFICIAL MANURES, &c.—Manufacturers and others engaged in making ARTIFICIAL MANURES may obtain every necessary instruction for their economical and efficient preparation, by applying to J. C. NESBIT, F.G.S., &c., Principal of the Agricultural and Chemical College, Kennington, London. Analyses of Soils, Guanos, Superphosphates of Lime, Coprolites, &c., and Assays of Gold, Silver, and other Minerals, are executed with accuracy and dispatch. Gentlemen desirous of receiving instructions in Chemical Analyses and Assaying, will find ample facility and accommodation at the College.

CLAYTON, SHUTTLEWORTH, & CO.'S PRIZE PORTABLE STEAM ENGINES, AND COMBINED THRESHING, STRAW SHAKING, RIDDLING AND WINNOWING MACHINE may be seen at their London Establishment, 6, Fitzroy Terrace, New Road, where all information relative thereto can be obtained. These Machines are constructed to horn Barley, and make a perfect separation of the chaff from the pulse. They are fitted with Elevators, which deposit the grain into bags, and beyond the feeder of Machine require no hands except to take away the Corn, &c., as threshed, the whole of the operations being performed by self-acting machinery, whereby the Corn, Straw, Chaff, and Pulse are delivered in the places assigned for them.
C. S. & Co. have paid special attention to this class of Machinery, and Fixed Barn Machinery, and from the position they have taken at the Royal and all the leading Agricultural Shows of England, flatter themselves that for efficiency, durability, and simplicity, their Engines and Machines are not surpassed by any other maker in England. All letters forwarded to the Works at Lincoln will have immediate attention; and Illustrated Catalogues forwarded to all parts of the kingdom postage free.

SCYTHES.
BOYD'S PATENT SELF-ADJUSTING SCYTHES may be had of the Manufacturers, WILLIAM DRAY & Co., Swan Lane, London; and of all Ironmongers and Seedsmen. A liberal allowance to the trade.

SLATE WORKS, ISLEWORTH, MIDDLESEX
EDWARD BECK MANUFACTURES in SLATE a variety of articles for Horticultural purposes, all of which may be seen in use at Worton Cottage, on application to the Gardener, Sundays excepted.
Priced Lists of Plant Tubs and Boxes forwarded on application.

WARNER'S IMPROVED LIQUID MANURE, OR GENERAL PORTABLE PUMP.
The valve is a ball of imperishable material, and cannot clog in action. The barrel is of galvanised iron, not likely to corrode, and can be raised or lowered at pleasure. The legs will fold together, and the whole may be carried on shoulder to any pond or tank required.
Price of 4½ in. Pump, with legs, 3*l.* 3*s.* The barrel is 27½ in. long, and the legs are 5 ft. high.
1½ inch Gutta Percha Suction Pipe, 1*s.* 6*d.* per foot.
1½ inch Flexible Rubber and Canvas Suction Pipe, 3*s.* 6*d.* per foot.
May be obtained of any Ironmonger or Plumber in town or country, at the above prices, or of the Patentees and Manufacturers, JOHN WARNER & SONS, 8, Crescent, Jewin Street, London.
Every description of Machinery for Raising Water, by means of Wheels, Rams, Deep Well Pumps, &c.; also Fire and Garden Engines, &c.—Engravings sent on application.

WARNER'S PATENT VIBRATING STANDARD PUMPS.
PATENT CAST-IRON PUMPS, for the use of Farms, Cottages, Manure Tanks, and Wells of a depth not exceeding 30 feet.

Diameter of Barrel	Length of Barrel, under nose.		£	s.	d.
2½ in.	short 1 ft. 7 in.	Fitted for lead, gutta percha, or cast iron flanged pipe, as required.	1	12	0
2½ „	long 3 „ 3 „		1	15	0
3 „	ditto 3 „ 6 „		2	12	0
3½ „	ditto 3 „ 6 „		2	18	0
4 „	ditto 3 „ 6 „		3	5	0
2½ „	short, with 15 feet of Lead Pipe attached, and Bolts and Nuts ready for fixing		2	12	0
2½ in.	long ditto	ditto ditto	2	15	0

The short barrel Pump is very convenient for fixing in situations of limited height and space, for the supply of coppers and sinks in Wash-houses with soft water from underground tanks, or in Hot, Forcing, and Plant Houses; they may be fixed, when desired, under the stage.
May be obtained of any Ironmonger or Plumber in Town or Country, at the above prices, or of the Patentees and Manufacturers, JOHN WARNER AND SONS, 8, Crescent, Jewin Street, London.
Every description of Machinery for Raising Water, by means of Wheels, Rams, Deep Well Pumps, &c.; also Fire and Garden Engines, &c. &c.—Engravings sent on application.

JOHN WARNER AND SONS,
Crescent, Jewin Street, London.
GALVANISED IRON TUB GARDEN ENGINE,
WITH WARNER'S REGISTERED SPREADER,

is strongly recommended, for durability and low price, viz., 2*l.* 19*s.*, to hold 10 gallons.
Larger sizes in wood or iron, viz., 14 gals., 24 gals., & 35 gals. May be obtained of any Ironmonger or Plumber in town or country, or of the Patentees and Manufacturers, as also Machinery of all kinds for raising Water from any depth to any height by Steam, Horse, or Manual Power. Prices sent on application. Syringes of various constructions and sizes from 9*s.* upwards. Metallic String from 5*d.* to 1*s.* 3*d.* per lb.

JOHN WARNER AND SONS, 8, Jewin Crescent, London, Manufacturers of FIRE ENGINES, PUMPS, GARDEN ENGINES, and SYRINGES.

Brass Syringes, 9*s.* to 18*s.*

All articles of JOHN WARNER & SONS' manufacture may be obtained of any Ironmonger or Plumber in town or country, at the advertised prices.
JOHN WARNER & SONS having been practical Horticulturists for many years, know exactly the requirements of both Amateurs and Gardeners. A gardener with a properly constructed pump will get through as much work in five minutes as he could with any Syringe in a quarter of an hour, and with half the labour to himself. Syringes are economical for small houses.
No establishment offers such a variety of effective machines for hydraulic purposes, whether to supply Gardens, Hothouses, Cottages, Farms, Mansions, or Boards of Health, with every requisite connected with the conveyance and distribution of liquids.
Fountains suitable for Conservatories, Lawns, &c.
Sheets of Engravings sent on application.

FOR LIQUID MANURE AND AGRICULTURAL PURPOSES.
EDWARDS' IMPROVED AIR-TIGHT AND WATERPROOF CANVASS SUCTION HOSE is the cheapest and most durable in use for the above purposes. Wove Canvass Hose without seam, &c.
32, Great Sutton Street, Clerkenwell.

WEDLAKE'S NEW HAY-MAKER, only 10*l.* 10*s.* 6*d.*, cash in advance. Wedlake's New Horse Hay Rake, cash in advance, 3*l.* 15*s.* 6*d.* Book on Making Hay Cheap, 1*s.* Book on Feeding Horses Cheap, 1*s.* List of 260 Cuts of Machines, 1*s.*—118, Fenchurch Street, City.

CAUTION.
PARKES' STEEL DIGGING FORKS AND DRAINING TOOLS.
Whereas very inferior descriptions of Steel Digging Forks are now manufactured and sold, and I have been informed that purchasers of the same have believed them to be the same as those manufactured by me, and to which the Royal Agricultural Society and numerous Agricultural Societies' prizes have been awarded, I hereby respectfully inform the public that every Fork manufactured by me is stamped with my trade mark "J. P.," and that Messrs. BURGESS & KEY, of No. 103, Newgate Street, London, are my sole Wholesale Agents, and I have authorised them to replace to the purchaser every Fork of my manufacture found defective; they will also on application send Wholesale and Retail Price Lists, &c., post free. FRANCIS PARKES & Co.

TURNIP SEEDS, ETC.
PETER LAWSON AND SON SEEDSMEN to the QUEEN and to the HIGHLAND AGRICULTURAL SOCIETY, beg leave to intimate that they are sending out the following TURNIP SEEDS, for which they respectfully solicit orders. They are all of the most approved kinds of last year's growth:—

ANERLEY POULTRY SHOW.—
President—The Right Hon. the Earl of VERULAM.
Vice-President—Sir JOHN PETER BOILEAU, F.R.S., Vice-President of the Zoological Society.
The FIRST EXHIBITION will be held in the Anerley Gardens, adjoining the Anerley Station of the London and Croydon Railway, and near the Anerley entrance to the Crystal Palace grounds, on TUESDAY, WEDNESDAY, and THURSDAY, August 28, 29, and 30.
The value of the Prizes will exceed 300 guineas. A detailed List of the Prizes and Certificates of Entry may be had on application to the Secretaries at the Office, Anerley, Surrey.
EDGAR SMALLFIELD } Hon. Secretaries.

The Agricultural Gazette.

SATURDAY, JUNE 16, 1855.

MEETINGS FOR THE ENSUING WEEK.
WEDNESDAY, June 20—Agricultural Society of England.

The value of phosphate of lime as a manure has been long an established fact. The history of the use of bonedust, of the use of coprolites in its place, of Dr. DAUBENY's travels in Spain in search of the mineral phosphate, of Mr. PAINE's discoveries in the beds immediately under the chalk, furnishes abundant proof of the estimation in which this mineral is justly held by agriculturists. It was, therefore, with great interest that we read the following letter, communicated to us by Mr. WHITWELL, of Kendal, in reference to his discovery of the mineral phosphate in Connemara. He says:—

"In 1851 or 1852, I was led to suspect that there might be phosphate of lime in Connemara; this arose from reading an article in the *Agricultural Gazette* on the localities and circumstances in which mineral phosphate of lime is found, especially in the United States.

"I accordingly examined the district with great care, and especially the beds of primitive limestone and the neighbouring strata, and got several specimens analysed, and below I give you the result. Some of the old lands, where the rocks are found, were for sale; but the price asked was too high to have made it worth the risk of purchase. You see that the following table shows a considerable amount of phosphate of lime, which might be made very useful, and perhaps more valuable beds might be found which would be worth exporting.

	1	2	3	4	5	6	7	8

Moisture	...	...	2.		...	...	...	...

"No. 1 was only examined to find out the proportion of phosphate of lime. No. 7 strikes me as the most valuable; it exists in large quantities on one of the townlands of the Martin estate. As I was not likely to become a purchaser, and did

not wish to prevent others enjoying the benefit of this information, I have this spring communicated to the different proprietors the facts which I have ascertained on this subject as they referred to their several estates.

"As to the localities in which the rocks containing phospate of lime occur, you will remember that veins of primitive limestone run through the district of Connemara in a direction nearly east and west; that most of these veins consist of vertical beds alternating with micaceous limestone or sometimes mica slate, the latter rock constituting the prevailing rock of the district, excepting the mountain tops, which are generally formed of granular quartz rock. There is one range of mountains separating the baronies of Ross and Ballinahinch in which the primitive limestone is found in horizontal strata, and capped by mica slate and quartz rock.

"I was led by the hints given in the article of the *Agricultural Gazette*, on Mineral Phosphate of Lime, to examine carefully the different veins of primitive limestone which can be traced for several miles by following the direction of the strike of the beds. After considerable research I discovered No. 7, which is situated in the valley of Glencaghan, about two miles to the north of the Galway and Clifden road, and about 11 miles from Clifden, near what is called the Canal stage. The beds in which it occurs may be traced from near the half-way-house between Galway and Clifden to the promontory which separates Kingston and Streamstown bays.

"It is in this vein of rocks that the Connemara marbles are found, several of which were analysed.

"The first specimen that was analysed was part of one of the beautiful ornaments made of the Lessonter marble (near to Recess); it gave 7.16 of phosphate of lime.

"The next specimen, No. 2, was from the same quarry, and you have the result above.

"The results were encouraging, but the large proportions of silica and magnesia led me to look for purer combinations of lime, and I examined the rocks at the western extremity of these beds, and got No. 3 from Knockbaun, between Kingstown and Streamstown Bays; the analysis was discouraging, but Nos. 5 and 6, from the marble quarries of Letternoosh, at the head of Streamstown Bay, were promising, especially No. 5, from its containing 4.6 per cent. of potash, in addition to 8.5 per cent. of phosphate of lime. The next analysis was of a piece of marble from the Barnanoraun Quarries, and it had too great a proportion of silica and magnesia to be useful.

"I then made Recess once more my head quarters, and having given up the hope of finding the large proportion of phosphate of lime I was looking for in the Connemara marbles, I carefully examined all the beds of limestone in the neighbourhood, and the accompanying strata as well as the igneous dykes which crossed them.

"Having travelled round several of the lakes, including most of Derryclare, I visited the gloomy and roadless valley of Glencoaghan, where I discovered extensive beds of No. 7, apparently underlying the Connemara marbles, which are here found almost horizontal, cropping out beneath the mica slate and quartz rock.

"No. 7 is, I think, also to be seen near to Ballinahinch Lake, and at the Barnanoraun marble quarries. I have also discovered it since near to Clifden, and also in small quantities near to the half-way house; but all the specimens were got from the same beds, which run nearly parallel with and to the north of the Clifden road. No. 8 was also obtained from the same beds, but afforded only two per cent. of phosphate of lime. Another specimen was submitted to analysis, but the report given by the chemist was, that it had only a trace of phosphate of lime."

The above le ter will be an encouragement to landowners in situations geologically the same as the district here referred to, to examine the limestones to which they may have access. A limestone is so easily reduced to the condition in which it becomes available as a manure, that the comparatively small per centage of phosphoric acid here indicated will be agriculturally of great value, which it would not have been had it occurred in a siliceous or claystone rock.

We hear of at least two Steam Cultivators being entered for Carlisle, namely, Usher's and Boydell's. The latter invention consists of the patentee's "Endless Railway" applied to the driving-wheels of a locomotive engine. Many ingenious contrivances have been devised to enable a carriage to carry its own railway. Thus, in 1821, a Mr. Barry patented a machine of the kind, in which a number of carriage-wheels and friction-wheels were mounted upon endless chains passed around drums at the back and front of the vehicle; and each pair of wheels being taken up behind and set down in front in its turn, the carriage could be drawn smoothly along upon the friction-rollers, while the wheels in contact with the ground *stepped* (as it were) instead of rolling over stones or other obstacles. In 1825 Sir George Cayley patented a locomotive apparatus on the same principle, but differing in practical details. Mr. Gordon, in 1822, patented an endless railway, consisting of a large hollow cylinder with belted racks or rails upon its internal circumference; and a locomotive engine being placed inside the cylinder and climbing up its internal railway, caused it to roll forward. A large drum of this kind was once employed with great advantage to transport heavy goods over an American swamp. One of the first steam-ploughs (Heathcote's) had the same principle differently applied. Instead of a drum, an endless platform passing round two great wheels at each end, carried a steam-engine within it: and while by means of gear-work and traction-tackle the ploughs were drawn up and down the field, the engine shifted itself and its moveable hard roadway from time to time along the headland. Mr. Boydell has endeavoured to supersede all such ponderous and unwieldy expedients by shoeing a carriage-wheel with short straight pieces of rail. It is unnecessary to describe this ingenious invention, as full details appeared in the papers, and public trials were repeatedly made during the past winter. As far as the surmounting of obstructing stones, crossing holes and travelling over rough uneven ground are concerned, the performances were satisfactory; the principal doubt remaining with us relates to the action of the rails in a deep, muddy, "founderously" bad clay road. However, in cultivating land, the apparatus would seldom have to venture upon very wet and sticky ground; the surface of any soil in a cultivable state will always be tolerably dry, and either firm and smooth, in large clods, or soft, deep and spongy. The rails cannot work well with a very rapid speed, and for tillage purposes this would never be required.

The steam cultivator, already constructed, consists (as we understand) of a common seven-horse portable engine, with reversing gear; to one of the hind wheels (each of which is 6 feet in diameter, and fitted with the endless railway) a spur-wheel of 5 feet diameter is attached: and this is driven by a pinion on the crank shaft. The forewheels are steered by means of a pole, with wheel, chain and pulleys, like those of a steamboat; and one man at this wheel has entire control over the engine, which can be turned in a circle of 40 feet diameter. It is intended that this engine shall *traverse a field, dragging ploughs or other implements behind:* the endless railway preventing it from sinking in soft earth, and laying hold of the ground so as to give a strong purchase for pulling. If the engine be only a common portable one, we suppose that it must prove useless upon sloping ground, but the merits and defects will quickly appear in the field. Mr. Boydell has been connected with agriculture and the management of landed property, and should therefore be a competent judge of the husbandman's requirements; but we think that when it has once become practicable and *admissible* for a locomotive engine to *travel over the land*, something more perfect than an old-fashioned horse implement ought to be actuated by it.

We will add a few words upon Mr. Usher's invention. Every one knows that it consists of *a locomotive engine having a revolving tiller mounted behind.* This tiller, driven by the engine, and rotating in the same direction as the paddle-wheel of a steamboat, not only digs up the soil, but in so doing urges forward the whole machine upon its carriage wheels; and so far from any extra power being needed for this propulsion, the propelling action of the tiller owing to the resistance of the earth is greater than is required. By this arrangement a great economy of power, and therefore of weight in the engine is obtained. The trials in 1852 were made with a machine of 10-horse power, and weighing 6½ tons; but Mr. Usher has lately completed an improved one of 14-horse power at 50 lbs. pressure, and weighing only 5½ tons. The breadth of work taken at once is 4 feet 2 inches; the rate of advance 1900 yards per hour, which accomplishes 2635 superficial yards per hour, or 6½ acres in a day of 12 hours. There need be little lost time in turning on the headlands, for the work may proceed round and round instead of up and down the field. The engine will ascend acclivities of one in ten, and turn in a circle of 16 feet diameter.

The quality of the work performed by it is the point of most interest to the farmer; and this appears to be very efficient for certain purposes, though not adapted for breaking up leas or any ground where the perfect burying of the surface is a matter of necessity. The cutters consist of curved *ploughs*, with coulters, shares, and mould-boards, only the latter do not twist over so much as those of a common plough. Each of these cuts off a sort of curved flake or slice of soil, turning it over sideways, and of course considerably crumbling and dividing it; but as the piece is thrown immediately before another cutter, it is again broken up and further comminuted. The tiller makes 30 revolutions per minute, and each plough takes a "bite" (or advance) of 9½ inches, the depth varying, according to the pleasure of the operator, from 6 or 7 to 9 inches: from these dimensions and this speed, the farmer may form some idea of the nature and appearance of any particular soil when dug by this engine; and he may also consider what would be the effect of pressing down every 4 feet breadth of his land with a roller more than 5 tons in weight.

We shall soon have three real steam-cultivators in the field, constructed upon as many distinct principles: there is Mr. Williams', ploughing by traction with a stationary engine; Mr. Boydell's, ploughing by traction with a travelling engine; and Mr. Usher's, tilling by a revolving apparatus attached to a travelling engine. Surely the true principle and the best practical embodiment of it may be educed from such a competition. *I. A. C.*

SHORTHORNS, THEIR PEDIGREES, AND MILKING POWERS.

In my last letter to you on the subject of short-horns, I mentioned that I had a cow in calf to the Duke of Glo'ster (11382). On Saturday last, the 9th of June, she produced a fine roan calf, which to my great satisfaction proved to be a bull. As the births of thorough-bred foals are recorded as they occur, so it would not be uninteresting if the births of the highest bred calves of the short-horn race were chronicled in like manner. In modern times, the latter have fetched prices quite as high as the former, and they certainly are as well worth them, since they conduce in an equal degree to the improvement of their race. In order to sustain the claim of my calf to the honour of his name appearing in your columns, I add the pedigree of his dam:—Ferret-Roan, of 1849 (bred by Mr. G. Bell), by 4th Duke of York (10167); dam, Fancy by Duke of Northumberland (1940); grandam, Fanny by Shorttail (262); gr.-g.-dam, Fletcher the 2d by Belvidere (1706); gr.-gr.-g.-dam, by a son of Young Winyard (2859), descended from Mr. J. Brown's old Red Bull.

It will be evident to any one conversant with the pedigrees of Mr. Bates' herd, that there is much very close breeding in that of my calf, and yet he far exceeds any calf I have bred this year in size and stoutness; in fact, his size is considerably above the average. This is another confirmation of the truth of Mr. Bates' view, that although to breed in and in from bad stock was, to use his own expression, "ruin and devastation," yet that the practice may be safely followed within certain limits where the animals so related are descended from first-rate parents, and are themselves of undeniable excellence. In this, as in every other point, success or failure depend upon the judgment of the breeder. It is, however, so much more common for men to over-estimate the merits of their own stock than to rate them too low, that it cannot but be useful to breeders carefully to guard against this tendency in themselves. It is certain that he who keeps his eyes open to excellence, wherever it exists, and avails himself of it whenever it is within his reach, will in the end have a better herd than he who, taking it for granted that his stock is perfection, never troubles himself to look beyond it. The history of short-horn breeding affords abundant evidence of the truth of this maxim, from the time when Mr. C. Colling purchased Hubback, which though of unknown pedigree, is an ancestor of many of our best short-horns, down to the introduction of Cleveland Lad by Mr. Bates into his herd.

I think that Mr. Horsfall, in his interesting record of his dairy practice, does not state whether he adheres to any one breed of cows, or whether he purchases such as he conceives best adapted for milking, irrespective of any other consideration. It would be both useful and interesting, however, if he and other agriculturists would state the results of their experience of the milk-producing powers of the principal breeds of cattle in the kingdom. As regards the short-horns, there is, I believe, a prevalent notion that they are indifferent milkers. Although facts may seem to lend a certain degree of support to this opinion, it is nevertheless a mistake which an impartial investigation must dispel. In the first place, the principal ancestors of the improved short-horns—the old Holderness cows—were, and are still, the deepest milkers in the kingdom. Is it likely, then, that these descendants should wholly have lost this valuable property? It may, indeed, be alleged that the celebrated cross with the Galloway cow resorted to by Mr. C. Colling may have produced injurious consequences in this respect. I think that the effects of this "alloy," whether for good or the reverse, have been over estimated, inasmuch as the cow "Lady," from which this family is descended, had only ⅛th of the Galloway blood in her veins. As Favourite (252) was quite unconnected with the "alloy," as were also several other celebrated originals of the short-horns, it is

evident that the union of them with the cow Lady would give ½d of that cross in the next generation. Except, therefore, in those herds where the "alloy" has been purposely followed out, it may be estimated that from th to th of Galloway blood is the utmost proportion which exists in modern short-horns, and it is obviously insufficient to obliterate any well established property belonging to the original race.

But leaving the domain of speculation to pass to that of fact, are the improved short-horns good dairy cows or not? From a considerable mass of evidence which I have collected to prove the affirmative of this proposition, my limits here only allow me to refer to the pamphlet of the Rev. H. Berry, who gives a long list of cows of the highest pedigree, with the measured quantity of milk given by each. Several of these gave 24 quarts daily; one 32, another 36, and one as much as 38 quarts. From this authentic testimony as to the early character of the breed, I must pass on to the valuable article of Mr. Dickenson (Journal of the Royal Agricultural Society, vol. xi.) on the farming of Cumberland, and the perusal of which I recommend to all who are interested in this subject. He mentions a high-bred cow called Kate, which gave 13 quarts at a meal, and from this quantity yielded at the end of a week 26 lbs. of butter! About the fact itself there can be no doubt, noting as it does on the testimony of her owner, Mr. Fisherson, of Harker Lodge. Another cow mentioned by Mr. Dickenson produced in 32 weeks 373 lbs. of butter, being at the rate of 11⅔ lbs. per week! My own experience on the subject is, that while their milking powers are at least equal to those of any other breed, they possess over all others the great advantage of keeping their condition on food on which common cows would starve. I am far from maintaining that all short-horns are good milkers. Two causes have contributed to injure them in this respect: 1st. That being a point to which many breeders are indifferent, they have selected their originals and continued to breed solely with reference to symmetry, size, and the propensity to early maturity. As therefore not only good qualities but the lack of them descend, it cannot be surprising that many short-horns give but little milk. 2d. From the emulation of breeders to show the finest animal at the earliest age, a system of pampering is begun at birth and carried on until the animal is either sold or slaughtered, which from the premature development of fat which it produces, tends to depress every other vital function. This system, unfavourable as it is for allowing the milk producing powers to develop themselves in any individual subjected to it, is fatal when pursued for generation after generation. After a time, "function," to use the words of Dr. Playfair, "begins to react on organisation," and a tribe of bad milkers is formed, among which individuals may even occur which will give no milk. Most sincerely do I wish that the forcing system were utterly exploded, injurious as it is alike to the short-horns themselves and their reputation. If they will not thrive on the ordinary keep of other breeding stock, the sooner they are abandoned the better. But it is their pre-eminent merit that they are the best thrivers in existence. As milkers, when well selected and rationally treated, it is not easy to find cows which will excel them. Sometimes even they will at one and the same time give large quantities of milk, and carry a great deal of flesh, although this is not in general desirable.

When I think of the number of good milkers I have known among the short-horns, and remember that it was an original characteristic of the tribe, it appears to me of great consequence, considering the national importance of dairy produce, to use every exertion to render so valuable a quality permanent. Good milkers are not over abundant among any variety of the vaccine species, and are most scarce among ill-bred mongrels. Mr. Atten, of Longcroft, had two or three years a white cow of the name of Penguin, descended from the stock of Mr. Robertson, of Ladykirk, which was an extraordinary milker. Colonel Kingscote's cow Honeysuckle is remarkable even in his herd, where this point is so successfully cultivated, for the same quality. Mr. Sainsbury is strenuous in attaining high excellence here as in every other point. Among my own cows, which are milking better this year than I ever knew them before, I may be allowed to name one which at nine years old is a most extraordinary milker, viz., Jessy, bred by Mr. R. Bell. She is by Napoleon (10552) dam by Cleveland Lad (3407), &c., and has bred a prize heifer. She may therefore be cited as a proof that is possible to combine the quality for which I am contending with the best short-horn blood. In conclusion I may add that I am preparing for publication an article on the breeding of short-horns, and shall therefore feel obliged for any communications from breeders containing facts in reference to this or other points worthy of notice. I shall also be glad to show my small herd to any breeder who may happen to be visiting this neighbourhood. They are as hardly kept as those of any neighbouring farmer, and as my object is to make cheese, the calves are weaned from new milk at an earlier age than is usual among the breeders of short-horns. *Willoughby Wood, Holly Bank, Burton-on-Trent, June* 12.

THE NEW MARKET AT COPENHAGEN FIELDS.

On Wednesday the opening of the new market was inaugurated by an entertainment given by the Lord Mayor and Corporation, at which H.R.H. Prince Albert was present. His Royal Highness arrived about 1 o'clock, and accompanied by a numerous suite proceeded to make the circuit of the market, and to inspect the arrangements which have been provided for the accommodation of cattle, sheep, pigs, calves, with their buyers and sellers. On reaching the pavilion an address was presented in which allusion was made to the benefits conferred on the metropolis by the transfer of its principal market from a central to a suburban locality, and to the interest shown by His Royal Highness Prince Albert in this, as in every other thing affecting the happiness and prosperity of her Majesty's subjects. His Royal Highness replied as follows:—

"My Lord Mayor and Gentlemen,—Accept the expression of my hearty thanks for your kind welcome, and for the gratifying assurance of your loyal and affectionate attachment to the Queen and her family. I have been much pleased by the opportunity which your kind invitation has afforded me of seeing and admiring the great work which you this day open to the public, a work which not only deserves all admiration in itself on account of the excellence of the arrangements and the magnificence of the design, but which will, I trust, be found eminently conducive to the comfort and health of the City of London. That its success will be commensurate with the spirit in which it has been undertaken and carried out, I cannot doubt. A certain dislocation of habits and interests must inevitably attend the removal of the great city market from the site it has occupied for so many centuries, and this may possibly retard for the moment the fullest development of the undertaking. But any opposition arising from such causes will soon cease, and the farmers will doubtless soon learn to appreciate the boon thus conferred upon them by the London corporation, in the increased facility which will be afforded to them for the transaction of their business, and the comparative security with which they will be enabled to bring up and display their valuable stock in this great metropolitan cattle-market."

Loud cheers followed his Royal Highness's reply. The procession then re-formed, and shortly afterwards the company, amounting to some 1100 persons, sat down to a most sumptuous cold collation, supplied by the Messrs. Staples.

The Lord Mayor gave the toast of "Her Most Gracious Majesty the Queen," which, it is scarcely necessary to state, was drunk with the greatest enthusiasm. The Lord Mayor next proposed "The Health of his Royal Highness Prince Albert, Albert Prince of Wales, and the rest of the Royal Family," and alluded to the affectionate regard in which his Royal Highness was held by all classes of her Majesty's subjects, as the promoter of the arts and sciences, and of the general welfare of the people of this country. —Prince Albert rose to acknowledge the toast amidst the most enthusiastic cheering. His Royal Highness said: My Lord Mayor and Gentlemen,—I beg to thank you for the very kind and flattering manner in which you have done me the honour to drink my health. I assure you it has given me great pleasure in being able to accept the kind invitation of the Lord Mayor, and to be present at the opening of this splendid and useful work. I can only add that the oftener he shall invite me to similar ceremonies the better I shall be pleased. Great works of this nature can only be undertaken by public bodies, and carried out with success by public spirit; and I hail the present instance as an earnest of your determination to accept the duties which your position has imposed upon you. Its future success, I will only add, will depend upon the bold and conscientious execution of those duties. Gentlemen, I again thank you, and beg to conclude by proposing "The Health of the Lord Mayor and Corporation of the City of London, and Prosperity to the New Metropolitan Cattle Market." His Royal Highness then departed, accompanied by the Lord Mayor, &c.

On Friday the market opened for the usual transaction of business. There was a much smaller market than usual; and it may be supposed that it will be some time ere trade flows freely in its new channel. The space enables all the arrangements of the market to be more orderly; and the lairage and other accommodation for both cattle and sheep will, no doubt, contribute to make the Copenhagen Fields more a market for store, as well as fat stock, than ever Smithfield was.

Home Correspondence.

Waste Land.—I was very glad to see your remarks, p. 361, on reclaiming or improving inferior land. It is a subject especially applicable to the Highlands of Scotland, where thousands on thousands of acres of good land are left in a state of nature and annually deteriorating, by the encroachment of Heather, Birch, Alder, &c., on what little Grass there is. As a general rule, sheep farmers do nothing to improve the pasture except now and then a surface drain or two, and of course it gets worse every year. In many places the ground would bear ordinary farm crops, and at any rate Mr. Fowler's plan might be adopted, or even cheaper modes of improvement; anything is better than going backwards. A large breadth is also cleared for deer forest. We read of the barbarity exhibited when the New Forest was made, but it seems the same thing in the nineteenth century is all right and proper when done by Highland lairds or English sportsmen. I wish some English agriculturist of Mr. Fowler's school would pay an agricultural visit to the Highlands, and give the world his opinion of the state of matters, leaving sporting out of consideration for the time being. *A. C.*

The Farmer's Rain Gauge.—The instrument on which I propose to furnish a few concise remarks has of late come greatly into vogue, and is constantly referred to in the leading periodicals. The object of a rain gauge is to ascertain the almost exact quantity of rain which has fallen in certain places, and within a precise period of time. Therefore, if the quantity be discovered, the depth of ground into which the rain has penetrated after a few hours' quiet interfiltration may be inferred with sufficient accuracy. The writer of these lines was applied to soon after the measures adopted by the sanitary Board of Croydon had been undertaken, and as some instruments were subsequently procured by parties interested in the inquiry concerning the quantity of rain which usually falls in this reputed dry locality, he resolved to prepare two instruments for his own experiments, the results of which have been so satisfactory as to induce him to offer the following simple directions, by which any intelligent person can possess himself of a good and trustworthy gauge at the outlay of from 3*s.* 6*d.* to 5*s.* It is customary to employ a round funnel as the recipient of the falling rain, made often 8 or 9 inches wide (with an upright, strong, and wired rim of the same width at the top) contracting to a neck an inch wide at the top, half or three quarters of an inch at the bottom, and about 5 inches long. This funnel is passed into a rather wide mouthed glass bottle, and adapted firmly to its neck by a linen compress wrapped round the junction of the tube. Safety from fracture is thus provided, and the funnel remains secure in its position even during a strong wind; evaporation is also prevented. As the quadrature or squaring of a circle is a problem which has never been absolutely solved, a square funnel 8 inches in diameter is recommended; and this can be made with great accuracy by a clever workman who appreciates the object and understands his business. The square of 8 inches (*i.e.* 8 × by 8) is 64; and therefore a divisor is at once provided by which the volume of water obtained can be accurately measured; whereas if the funnel be round and of the same width, its diameter must be multiplied by 3.142 decimal fractions to obtain an approach to a correct estimate of its superficial square inches. A cubic inch of rain water weighs 252½ grains, and this forms the basis of every calculation. A standard measure can be prepared by correctly weighing an ounce glass phial with so much rain water in it as will exactly balance the scales, the 252½ grains being added to the tare weight in the one scale. The water level should be marked either by a sharp file or by the point of a fine camel-hair pencil and a little paint. Thus also, the weight of any portion of a cubic inch can be ascertained and marked on the phial, and by this standard a glass vessel (with a lip) or an ounce medicine phial may be graduated from two to any number of cubic inches, with much accuracy. The apothecary's measure glasses might be used, provided allowances were made for a slight deficit in their capacity to the extent of 10 to 15 drops in each fluid ounce measure. It now remains to describe the method of fixing the rain guage. It should be premised that the instrument must be situated as nearly as possible to the surface of the ground, otherwise no just comparison can be drawn between the water in the bottle and that absorbed by the ground, for it has been proved that in proportion to the increased elevation of a guage, is the volume of water therein diminished. (See Dr. Charles Hutton's "Philosophical Dictionary," vol. 2, article Rain, p. 279). A flower pot of 24th or 16th size, sunk to its rim in any open spot of ground near the dwelling, may receive the bottle, which will be secured and protected by half a gallon of moist sand placed round it. The total fall of rain during the five months of this year, to June 1, amounted to no more than 5.62 inches. This deficiency of more than one-half of the usual average could not have been ascertained by other instruments or registers; and thus the utility of a simple gauge upon every farm is substantianted. And, in addition to this argument, we have a right to infer that were the land thoroughly broken up and pulverised from 9 to 12 inches in depth, the rain which falls upon its surface—be it redundant or under the average volume—would in one case pass freely into artificial drains or a natural absorbent subsoil; or, in the other, would permeate with facility the land prepared and rendered fertile by appropriate machinery. The greatest fall of rain that we have registered at Croydon fell on the 13th May, when 13 fluid ounces were found in the bottle, and proved by the standard measure to be equivalent to 26 cubic inches. The surface of a round funnel, measured by its girth, was 27 inches, the diameter 8½ inches, or more nearly 8.6 inches, the square of which =73.96 inches. The divisor so given may be taken as 74; therefore 26 cubic inches falling upon a circular surface of ground, equal to that which would be marked by the rim of the funnel inverted, and pressed upon it, would have entered and filtered through that small portion, had it not been intercepted and retained by the bottle. Now the decimal process by which the result was obtained, consisted solely in dividing 26 inches by 74, the presumed square capacity of the funnel rim—the product being 0.35 inch. Mr. Glaisher gives a fall of 0.7 inch on the 31st May, being double the quantity found here. Such are the uses of and valuable products detected by rain guages. They prognosticate nothing of the future, but they record local facts, which tend to the advancement of agriculture, as we hope has now been rendered apparent. *Croydon, June* 7.

Mangold Wurzel.—I notice in your Paper for Saturday, June 9, the statement that Mangold Wurzel is injurious to breeding sows and to little pigs; this was also asserted some years back in your Journal, but afterwards contradicted by another correspondent. The present reassertion of the statement has startled me, as I have just some 5 acres of Mangold for breeding sows' winter food and their young ones. I, as an old subscriber and occasional correspondent, would feel greatly obliged by some authentic information on the matter—that is to say, an answer grounded on experience whether Mangold is injurious to breeding sows and little pigs, and why; whether cooking or souring the roots prevents their injurious action. *M. R.*

Societies.

ROYAL AGRICULTURAL OF ENGLAND.

Monthly Council, *June* 6.—Mr. Raymond Barker, V.F., in the chair. Forty-five new members were elected.

Finances.—The Chairman reported the result of the

Monthly examination of the accounts, from which it appeared that the current cash-balance in the hands of the bankers was 2876*l.*

Journal.—Mr. Thompson, Chairman of the Journal Committee, reported the following adjudications :—

I. To the Rev. W. R. Bowditch, of St. Andrew's, Wakefield, Yorkshire: the prize of 30*l.*, for the best essay on the chemical changes which occur in the decomposition of dung.

II. To Robert Vallentine (land-surveyor), of Burcott Farm, Leighton Buzzard: the prize of 10*l.*, for the best essay on the retention of moisture in Turnip soils.

The Committee also reported the following recommendation, which was adopted by the Council :—

That in future, under the head of "Miscellaneous Communications," a portion of the journal be allotted to short papers from such members of the Society as may favour the Journal Committee with an account of any matter of special interest which has come under their notice, in the management of their farms, or in their immediate neighbourhood.

Chemical Investigations.—Mr. Thompson also reported from the Chemical Committee the following recommendation, which was adopted by the Council :—

That in future, the one or more subjects of lectures to be given by the Society's consulting-chemist, in the following spring, be fixed before the Council adjourns over the summer vacation; and that the subjects for chemical lectures in 1856 be fixed at the Monthly Council in July.

Carlisle Meeting.—Mr. Raymond Barker reported from the General Carlisle Committee the progress of the arrangements for the Society's Meeting to be held at Carlisle in the last week of July next.

Special Council, *June* 13.—Mr. Miles, M.P., President, in the chair.

Carlisle Meeting.—Mr. Raymond Barker reported the further arrangements made by the general Carlisle Committee in reference to the ensuing country meeting at Carlisle.

Judges.—The Council appointed the Judges of live-stock for the Carlisle meeting, deferring the appointment of Judges of implements and machinery until the next monthly Council, when the report of the Implement Committee would be received, and their recommendations taken into consideration.

Papers and Lectures.—The President, in referring to the resumption of the business of the weekly meetings of the Council, announced the following arrangements :—

1. That on Wednesday the 20th of June, at 12 o'clock, Mr. Thomas Scott's Paper on the Production of Butter and the management of Dairies, would be read; and Mr. Slaney's statement on a simple and economical mode of removing soil from one part of a farm to another.
2. That on Wednesday the 27th of June, at 12 o'clock, Professor Way would deliver before the members a lecture on the use of Fish as manure.
3. That on Wednesday, the 11th of July, Professor Simonds would deliver before the members a Lecture on the Physiological Conditions affecting the quantity and quality of Milk secreted by the Cow under different circumstances of Feeding and Management.

Bath and West of England.—At Tiverton, last week, this Society had a very successful annual gathering. On the Thursday, especially, a multitude of people visited its well-filled show-yards. The Devon breed of cattle was not so well represented as might surely always be expected at the meeting of a West of England Society; the Herefords were entirely awanting! There was a very admirable show of implements, most of our principal implement-makers contributing specimens.

The public meeting on the show day was well attended and signalised by a useful address from Lord Ebrington on Agricultural Education.

His lordship offers for three years a prize of 20*l.* "to the sons of the yeomanry of Devonshire, between the ages of 18 and 25, just entering upon life, upon obtaining a certificate of competency in scriptural knowledge, and who should pass the best examination in that acquirement; also in the English language, and in the Geography and History of the British Empire, and in practical mathematics. And he announced that he had the assistance of three gentlemen who had consented to aid him, namely, the Rev. Chancellor Martin, Sir Stafford Northcote, and R. Dymond, Esq., who had promised to conduct the examination for him, and to go carefully through the candidates' papers, also making *viva voce* examinations of each candidate and arranging them in classes, and placing every individual, as at Cambridge, according to the manner in which he had answered at his examination."

We doubt not that this offer will produce some degree of emulation among those who are already securing to themselves the education which Lord Ebrington desires to extend. Whether its main purpose, that of exciting anxiety on the subject of education where it does not as yet exist, shall be served by it, we very much doubt.

Among the prize holders for Devon cattle are Mr. Davy, of North Molton, for the best three-year old bull; J. W. Buller, Esq., for the 2d best three year and two year old bulls; also for the 2d best pair of yearling heifers; Mr. J. Bodley, of Crediton, for the best two year old and yearling bulls; Mr. W. Farthing, of Bridgewater, for the 2d best yearling bull, and for the 2d best cow and the best heifer; Mr. J. C. Halse for the best cow; Mr. F. Webber, of Tiverton, for the 2d best heifer and the best three cows in calf. Many of the best known breeders of Devon cattle were absent—owing, it is understood, to their refusal to submit to the decision of any other judges than those of their own opinion on the character of the pure Devon breed.

The prizes under short-horns were carried off by Messrs. Widdicombe, of Hay Ugborough; Rev. T. G. Smith, of Uffculme; Mr. Stratton, of Swindon; Mr. Bowley, of Cirencester; Mr. Abbot, of Long Ashton. There was a fair show of sheep, especially of Longwools, Leicester, and Cotswold; and, as we have said, a very full competition in the implement yard, where the prizes for ploughs were divided between Messrs. Ransome and Howard, as usual, and the awards for steam-engines were made to Mr. Hornsby and Mr. Tuxford. The wet weather of the first days was succeeded by sunshine on the Thursday, and the principal day of the meeting was thus a most successful one.

The Poultry Exhibition in connection with this Society's show of stock experienced a due share of attention, and proved that good birds will still realise good prices. Two hundred and eighty pens of poultry were entered for competition, besides 71 pairs of pigeons. The arrangements were with a few exceptions good, the useful poultry being placed in one large tent, and the bantams and pigeons in a small or what may be termed "fancy" tent. On the first day we noticed that cards were very properly placed over the pens, stating the variety of their occupants and the name of the owner, thus saving the visitor the unnecessary trouble of constantly referring to the catalogue. On the following morning, however, that part of the card on which the name of the owner was written had disappeared; and for what purpose, unless to effect a compulsory sale of catalogues, we are at a loss to imagine. Anyhow, the general opinion (in which we heartily coincide) was that such a proceeding ought not to have received the sanction of the directors. In consequence of the severity of the weather at the commencement of the year, the chicken classes were not well represented, and the entries were but few. The following is a list of the successful competitors :—

Class I.—Spanish: 7 entries. Mr. Daniel Parsley, Bristol; Mr. H. D. Davies, Spring Grove House.

Class II.—Spanish Chickens: 1 entry. Mr. Buckley, Llanelly, Carmarthenshire.

Class III.—Dorking: 19 entries. Mr. H. D. Davies; Mrs. H. Fookes, Blandford.

Class IV.—Dorking Chickens: 5 entries. Owner unknown; Mr. H. D. Davies.

Class V.—White Dorking: 10 entries. Mr. W. Symonds, Milbone St. Andrew; Mr. Coleridge, Ottery St. Mary.

Class VI.—White Dorking Chickens: 2 entries. Mr. Manfield, Dorchester, 2d prize.

Class VII.—Cochin China, cinnamon, buff, and lemon. Mrs. Fookes, Blandford; Mr. Crane, Tolpuddle.

Class VIII.—Cochin China Chickens. Mr. Rodbard, Aldwick Court; Captain Snell, London.

Class IX.—Cochin China, brown, partridge, and grouse. Rev. G. F. Hodson, North Petherton; Mr. G. C. Adkins, Edgbaston.

Class X.—Cochin China Chickens: 2 entries. Rev. G. F. Hodson; Mr. Kingdon, Exeter.

Class XI.—White Cochins. Mr. Cyrus Clark; Rev. J. H. Gandy, Taunton.

Class XII.—White Cochin Chickens: 2 entries. Mr. J. R. Rodbard, 1st and 2d prizes.

Class XIII.—Black Cochins: 3 entries. Mr. Cyrus Clark, 2d prize.

Class XIV.—Brahma Pootra. Mr. H. W. Davies; Mr. R. H. Bush, Clifton.

Class XV.—Game, white and piles. Rev. T. L. Fellowes, Beighton Rectory; Mr. Jos. Symonds, Gorwell.

Class XVI.—Game, black breasted and other reds. Mr. G. C. Adkins; Mr. J. R. Rodbard.

Class XVII.—Game, duckwing and other greys. Mrs. R. Fookes, Blandford; Mr. W. V. Drake, Lockwood.

Class XVIII.—Game, black and brassy winged. Mr. W. V. Drake; Mr. E. Farmer, Greet.

Class XIX.—Malay. Mr. J. Leighton; Miss King, Taunton.

Class XX.—Hamburghs, gold pencilled. Mr. Thos. M'Cann; Mr. J. B. Chune.

Class XXI.—Hamburghs, silver pencilled. Rev. T. L. Fellowes; Mr. Edward Archer.

Class XXII.—Hamburghs, golden spangled. Mr. Hugo; Rev. T. L. Fellowes.

Class XXIII.—Hamburghs, silver spangled. Mr. Chune, Coalbrookdale.

Class XXIV.—Polands, black with white crests. Mr. G. C. Adkins; Mr. P. P. Edwards, Lyndhurst.

Class XXV.—Polands, gold spangled. Mr. R. H. Bush, Clifton; the same, 2d prize.

Class XXVI.—Polands, silver spangled. Mr. G. C. Adkins; Rev. G. H. Gandy.

Class XXVII.—Special Prizes. Mr. H. D. Davies, for Rangoon; Rev. T. L. Fellowes, for Black Hamburgh.

Bantams. Messrs. Adkins, Ballance, Bayly, Loders, Mapplebeck, Rodbard, and Ford.

Ducks. Mrs. Ford, Mrs. Fookes, Messrs. Ballance and Edwards.

Turkeys. Messrs. Edwards and Rodbard.

Geese. No entries.

Farmers' Clubs.

London, *June* 4. *Road Management.*—The following is the remainder of Mr. B. Denton's paper :—

Macneill has shown us, by actual improvements made on the London and Shrewsbury turnpike-road, that the comparative force of traction required to draw a waggon weighing 21 cwt. over a well made pavement was 33 lbs., over a broken stone road of great hardness was 46 lbs., and over a gravel road was 147 lbs.; but I am unacquainted with any experiment showing the tractive power required to move a waggon of 21 cwt. through a lias clay soil during the wet seasons of the year. We do know, however, from actual recorded trial, that the mere difference of whether a gravel road be wet or dry changes the figures representing the draught from 13 when dry and clean to 32 when wet and muddy, and when we contrast these figures with those I have just quoted, we shall be able to appreciate the resistance of strong and wet clay. It is not possible to find material affording so many elements of resistance to motion as unmitigated clay during nine months in the year, for in addition to the impeding power of collision, friction, and gravity, you have the influence of adhesion, which adds weight to resistance; and it is this consideration, I presume, that has led the Royal Agricultural Society of England to offer a prize for the best essay on "Farm Roads," with particular reference to clay farms. In all soils their power to resist motion will, of course, depend upon their want of hardness and consistency in a natural state, influenced by its adhesiveness when wet, and the relative value of internal roads to farms will be in proportion to the quality of the land in those respects. In tenacious clay soils the want of roads will be felt most; in a free gravelly soil it will be felt least. Though anxious to gain an unanimous admission of the economy of good farm roads, I will not dwell long upon the importance of a level way or easy gradients in the roads we use. It is so seldom that we can venture upon cuttings and embankments for farm accommodation, that it will suffice to illustrate the advantage of a level road over a hilly one, by stating that whereas the number of tons a horse can draw on a hard inflexible tramway (and it is by no means visionary to refer to tramways for the common service of well-arranged farms where the ground is level is 13, the number he can draw where the gradient is 1 in 100, is only 4½. But this comparison hardly puts the case tangibly, nor in a homely view. We find many farms abound in steep hilly slopes, with inclinations of 1 in 30 or even steeper, and it will be more to the purpose, therefore, to state that it has been practically demonstrated that the expense of power in £ *s. d.* required to draw a load of one ton along a common road on various gradients is as 6*d.* where horizontal to 8*d.* where there is a rising gradient of 1 in 30. If we adopt this comparison, and feel sure it will be found very near to the fact, we see that (all other points being equal with respect to formation and condition) the comparative saving of a level road over a rising gradient of 1 in 30 is 2*d.* per ton in the ordinary cost and application of horse labour on a farm. As a level road is manifestly more economical than a hilly one, so a straight and hard made road is better than a tortuous field tract over a tenacious soil. This twofold proposition is so manifest that it needs no proof. But in order further to test the important question of "What is the value of a farm with good and sufficient internal communication, and what the value of the same farm without any?" let us suppose a farm of 500 acres of a heavy clay soil with the homestead in the centre and good public roads on two sides of it; 500 acres will cover a square of seven furlongs aside. Now it would probably require two miles of road to give moderate accommodation to such a farm. This at an average price of 5*l.* a chain, will cost 800*l.*, and if we take the interest at 5*l.* 2*s.* 10*d.* per cent. (the rate of instalment for repayment of principal and interest charged by the General Land Drainage and Improvement Company) the annual charge will be 41*l.* 2*s.* 6*d.* Is such a farm permanently improved by the acquisition of a road to the annual amount of 41*l.* 2*s.* 6*d.* or 1*s.* 8*d.* per acre? When we consider that this annual sum of 41*l.* 2*s.* 6*d.* will barely cover the keep of one horse and a half (it does not much exceed what I understand to be Mr. Thomas's statement of the keep of one horse) without regard to the wear and tear of the horse itself, and of carts, harness, and implements, I think we shall all answer in the affirmative. In such a farm of 500 acres, 400 acres being arable and 100 acres pasture and meadow the produce of manure will be under ordinary good management from 1400 to 1520 tons of manure in the whole. This will suffice to give a dressing of 12½ tons to 116 acres and the number of miles travelled in doing that will be 966 out and back, if we take the average road-lead to be one third of a mile or 27 chains. Now if we remember that in heavy land we may not only pull our horses to pieces, but positively injuriously affect the land itself if we do not take advantage of every hour of dry weather but prolong the operation during wet weather, it is hardly possible to overate the advantage of a hard road which will allow of a horse to travel at least 20 miles daily with the same ease that he will travel 12 or 13 miles, doing the same work through clay mud. I repeat the difference of 28 days which these figures show in the time it will require to get manure on to the land is one consideration which will go far to meet interest on the outlay of making the road, leaving out of consideration the injury done to tillage as well as damage to horses by carting over clay soils in wet days. If, therefore, we add all these advantages together, the gain in time—in power—in the wear and tear of carts and implements, and in the personal comfort of the occupier, there can be no doubt that 1*s.* 8*d.* per acre represents at least the value of the improvement in this assumed case. We shall not be outstepping truth and practice in the resolution we may adopt, if we assert in general but decided terms, that the existence or non-existence of internal roads on a farm is an essential element in determining the rent that should be paid for it, and that the provision of farm roads being a permanent improvement, and in the case of clay soils a very costly one, the outlay is properly a landlord's and not a tenant's duty. It was my intention to have given some details of the mode of making private roads, particularly through clay lands and fen lands, where they are most wanted, but time will not permit. Suffice it to say, that the advantages of laying *the bed of the metalling* securely dry by longitudinal under-drains—one on each side of the metalling—and laying the *surface* of the road dry by open drains on each side of the formation, are points of practice now fully acknowledged, as well as the profitable use of burnt balls (*i. e.* burnt clay lumps) as a bottom stratum in those clay or fen land districts where harder materials are not to be obtained except at too great a cost. This will apply to the London clay, Oxford clay, and lias clay districts, and to the fens of Lincolnshire and Cambridgeshire, where miserable boggy droves still exist, as the only means of approaching the lands of numerous owners and occupiers, who by combination could take advantage of the present facilities of applying borrowed capital repayable by instalments for the purpose of making roads just as easily as single landowners may do the like for draining, and the erection of farm buildings. I beg to place before you some cross sections of roads (alluding to plans which were exhibited) which may elicit discussion on the practice of road making, and of which I shall be happy to afford every explanation. You will observe that in each case the drainage for both surface and subsoil has been most carefully considered as the first essential in road-making. The price per chain of making roads will necessarily depend upon locality. I am now engaged in making them at prices varying from [illegible] 6*l.* 10*s.* per chain. The sections placed before you upon the farm roads made in various parts of England:—No. 1 shows a road made in the red sandstone district, of which the bottom stratum, 6 inches thick, was formed of a rough paving or blocking of the local sand, one rock covered with 4 inches of the best limestone in pieces that would pass through a 2-inch ring, at a cost of from 4*l.* 12*s.* 6*d.* to 6*l.* 17*s.* 6*d.* per chain. No. 2 shows a road intended for a fen district in which perforated bricks are laid flat in a convex base, and covered with burnt balls from the bottom stratum. The surface covering is intended to be screened gravel. The estimate cost of this road is 5*l.* 17*s.* 6*d.* per chain. No. 3 shows a road made in the stiffer lias and Oxford clay districts. The bottom stratum is of burnt ballast and the top screened gravel. The cost of this description of road varies according to the price of coal and gravel from 4*l.* 10*s.* to 5*l.* per chain. No. 4 shows a road in the London clay district. The bottom stratum is of chalk and the top of screened gravel. The cost will vary according to the depth of the chalk lying immediately below the clay, or the distance from whence it can be obtained, from 3*l.* 10*s.* 6*d.*, to 4*l.* 15*s.* per chain.

Mr. Baker had supposed when he read the notice on the card that Mr. Denton would treat of the providing better means of roads to their farm homesteads than of the general question of the roads of the kingdom; because it might happen that the public roads were in a very different state—in some places better, in some places worse, than in others. He was of opinion that the main roads of the kingdom were, taken as a whole, very good, and this had been effected by the local management of parishes. Although there might be some deficiencies in local management, he still thought that it was far better than having a central board, for every parishioner was more or less interested in the disposal of the funds. He would take the case of the Poor-law as an instance, and there it would be found that the expense had been very considerably increased, and the results attained very much better. He had always felt that when the roads were taken out of the hands of the parishes their rates would be increased instead of diminished. There had been great jobbery in the turnpike trust. Materials were put down irrespective of the state of the roads or of the time of year; and the managers had supplied the materials from their own pits. The late Surveyors' Act prevented surveyors from supplying materials or teams without [illegible] obtained a license, but of what avail was that, for they had only to apply to a magistrate, and they always obtained it. In his own district, where the roads were excellent and the cost small, 1*l.* per mile would form a considerable item. He had in his own constructed a road which had cost from 400*l.* to 500*l.* per mile. He had first drained the land well; had drains run parallel with the side of the road, and filled up with stones from the land. Where a road holds water, which is certain to break it up, the first step to take would be to properly drain it. He was satisfied that if the management of the roads were placed in an irresponsible board jobbery would creep in; and if they had good roads

would be at double the expense. He did not like the plan of removing the management from persons interested to persons who would only make a profit out of it.

Mr. Woods, of Sussex, said the roads in his neighbourhood were in a very excellent condition, and he thought the parish roads generally were made very well. He thought that by electing as surveyors men who had other business to attend to, the roads were neglected, which would not be the case if the plan of Mr. Denton's was carried out. There could be no question that if they took the water off the roads they would be better. He thought that this was not exactly the sort of question that ought to come before the Club, because they must all know the value of good roads. In his neighbourhood men who had been tradesmen in Brighton, and successful in their speculations, bought a few dirty acres, and then thought themselves country gentlemen. It was these sort of men who dabbled with the management of the roads, and the sooner they were trodden out and got rid of the better for the land and the country.

The Chairman stated that in the Isle of Wight, where the roads were in the best possible condition, the management was placed in a sort of union. In the parish in which he resided, the management of the roads was entrusted to four separate boards. The consequence was that the rates were higher, and the system was very bad and unconnected.

Mr. Owen said the roads in his parish were in very excellent condition. He should have liked to have heard something about roads on farms and the improvement of cross roads, which were a disgrace.

Mr. Denton, in reply, stated that it was his original intention to have treated in his paper of roads on farms, but when he looked at the subject he thought it better to treat it generally. Within the last 20 years the whole system of intercommunication changed and he thought that gentlemen ought to consider the question not as relating to their own particular parish or district, but as a general one. A few years since and they used to take the coach if they wished to travel, but now they had only to go to the railway station: and he thought that the parish in which the station was situated was entitled to some remuneration. The present system of managing roads was not an economical or a just one. He trusted that in the resolution to be carried that evening they would affirm the principle of consolidation.

The Chairman then put the following resolution, which was carried—"That in the opinion of this club the formation and maintenance of good roads is worthy of far more attention than it has yet received from the agriculturists, and that a better system of management, both local and general, is a matter of economy very desirable."

Votes of thanks to Mr. Denton and to the Chairman concluded the proceedings.

Calendar of Operations.

JUNE.

Hexham District.—We have delayed our monthly note of operations, in the hope of being able to report more favourably of the weather, and are glad to be now able to do so. Seldom have we had so cold and backward a month of May, not indeed for 17 years. On looking over our journal the almost daily entry is "cold east wind," interspersed with "hail showers" and such like, with the exception of the 2d and 23d, which were fine mild days; the month has been bitterly cold. On the 31st we had a heavy rain early in the morning, but it was not till Saturday the 2d inst. that the wind got out of the east. On that day we had a fine mild rain from the south-west, and since then fine growing weather. Swede sowing would have been pretty generally finished ere this but for the rain in the end of last week, but this week will see the most of them into the ground, and if this weather continue there will be a speedy braird. Spring-sown Wheats are thin on the ground, but Barley and Oats look well, in spite of the cold and drought. Pastures have been very bare, and Hay-straw backward; Whitsuntide fair a heavy one in consequence, especially for sheep. Of stirks in good condition there was a poor show, and long prices were asked and given. The show of two-year olds was also poor, which maintain prices at a higher figure than would otherwise have been. The last few days' moisture and warmth have already made a marked improvement on the Grass, and we may now hope to see our cattle getting a good bite. The hay crop will be both thin and short. Old hay is now selling at from 7*l.* to 8*l.* per ton. Both grain and stock markets keep up. *W. D.*

Notices to Correspondents.

Barley Stubble: *Amateur Farmer.* If the weather should suit you, 20 lbs. of Trifolium incarnatum harrowed in after a shower upon a clean Barley stubble in September—the land being in good condition—will secure as great a quantity of green food for forage in June of next year (and as cheaply obtained) as you can get in any other way.

Cyclopedia of Agriculture: *G. Cook.* It contains articles on the different cultivated plants, with statements of the modes and times of applying manure for them; an article on manure generally, especially with reference to farm-yard manure; and articles on the different artificial manures sold or made.

Eggs without Shells: *R C B.* The hens must be either out of health, or possibly they have not access to lime. The food and range you give them seem to be the best security for the former. Try laying pounded oyster shells in their way.

Guano, &c.: *J Fisher.* The treatment of crops as to manure will be found under each. Unless you get the full value of your artificial manure back in the crop of Wheat you have reason to be dissatisfied. The superphosphate looks very dark, but the cause of this we are unable to state.

Irish Moss: *A Constant Reader* asks how it is prepared for feeding cattle or calves?

Lucerne: *G W.* You should have sown it a month ago in shallow drills, in rows a foot apart, using about 16 to 20 lbs. of seed to the acre. To transplant the plants is more costly and less productive.

Orange Jelly Turnip: *Colo.* We have no experience: and that of others, as reported to us, is most contradictory. We should be glad of information from any known correspondent.

Poultry: *C R D.* We have not seen any full report of the native breeds of France, and do not know where to direct you on the subject in the agricultural literature of France. We saw nothing at Paris that would furnish the material of any such report.

Reports of the Crops: *E H.* We shall publish weekly information up till harvest time.

Self-acting Railway: *W C M.* We have had no experience of its use. See leading article.

Spanish Chestnut: *W H.* We know of more than one very old building in which the timbers of the roof are wood of the Spanish Chestnut. So that it is unquestionably durable.

Steam Engine: *A Scotsman.* We would not erect one for threshing 40 acres of grain crop. Are there no locomotive machines and engines for hire in your neighbourhood?

Young Colt: *J W S.* Cow's milk or ass's milk may be given to the foal several times (4 or 5 times) during the day, by means of a ladle with some rag tied round the mouth. The little animal will be the best judge of the quantity. Ass's milk contains less butter, and more resembles horse's milk than that of the cow, and is therefore to be preferred. The foal will soon learn to eat other food, such as Carrots and bruised Oats in the winter and green food in the summer. *W. C. S.*

RICHMOND & CHANDLER'S PATENT CHAFF-CUTTING MACHINE.

All the various modern Implements of Agriculture manufactured on the most scientific and improved principles, suitable for home use and exportation.—Address, Richmond & Chandler, Salford, Manchester: and 32, South John Street, Liverpool.

☞ Catalogues Gratis.

PARKES' STEEL DIGGING FORKS & DRAINING TOOLS.

MESSRS. BURGESS and KEY, as Mr. Parkes' Wholesale Agents for England, have always in stock a large assortment. These Forks and Tools are now in use by upwards of 1000 of the Nobility and Farmers, members of the Royal Agricultural Society, who pronounce them to be the best ever invented, and to facilitate labour at least 20 per cent. Price Lists sent free on application, and Illustrated Catalogue of the best Farm Implements, on receipt of eight postage stamps.

IMPROVED MOWING AND ROLLING MACHINE.

ALEXANDER SHANKS and SON, Arbroath, Forfarshire, Inventors and Sole Manufacturers, respectfully solicit the attention of the Nobility, Gentry, and Gardeners to this Improved Machine for Mowing and Rolling Lawns. The Machine is in operation in the Royal Gardens at Windsor Palace, Buckingham Palace, and at Osborne, in the Botanical Gardens at Kew, Regent's Park, Manchester, Sheffield, &c.; at Blenheim Palace, Trentham, Cleveden, Elvaston, Broadlands, Woburn Abbey, Clumber, Lilleshall, Castle Howard, Shrubland, Eridge Castle, Enville Hall, Tiptree Hall, Chatsworth, and in many other of the principal gardens in the kingdom as well as in the United States, British America, and on the Continent, where its merits have been fully proved, and its success established.

The machine is made to cut the breadth of 42, 30, 20, and 15 inches respectively, is exceedingly durable, easily managed, and adjusted to cut to the length required. The execution of the work is far superior to what may be attained by the most skilful mower, while at the same time a great saving of labour is effected, and the turf much improved. By the largest machine a Scotch acre may be mowed, rolled, and the Grass collected in one hour.

A. S. and Son have much pleasure in stating that they have made considerable improvements in their 15-inch or hand machine this year, by which the draught is considerably lessened. This machine combines all the merits and advantages of the larger machines with firm and secure construction, and is admirably adapted for borders and for lawns of no great extent.

Alexander Shanks and Son also respectfully solicit notice to "Fleming's Weeding or Salting Machine" for destroying weeds in gravel walks, court-yards, drives, &c. This machine is now in operation in many parts of England, where it has given ample satisfaction as the best and most economical means of thoroughly keeping down weeds or Moss.

Further particulars, with testimonials and prices, may be had on application.

WATERPROOF PATHS.
BARN AND CATTLE SHED FLOORS.

THOSE who would enjoy their Gardens during the winter months should construct their walks of PORTLAND CEMENT CONCRETE, which are formed thus:—Screen the gravel of which the path is at present made from the loam which is mixed with it, and to every part of clean gravel add one of sharp river sand. To five parts of such equal mixture add one of Portland Cement, and incorporate the whole well in the dry state before applying the water. It may then be laid on 2 inches thick. Any labourer can mix and spread it. No tool is required beyond the spade, and in 48 hours it becomes as hard as a rock. Vegetation cannot grow through or upon it, and it resists the action of the severest frost. It is necessary, as water does not soak through it, to give a fall from the middle of the path towards the sides.

The same preparation makes first-rate paving for BARNS, CATTLE-SHEDS, FARM-YARDS, and all other situations where a clean, hard bottom is a desideratum. May be laid in winter equally well as in summer.

Manufacturers of the Cement, J. B. White & Brothers, Millbank Street, Westminster.

WARNER'S SWING WATER-BARROW
(TO HOLD THIRTY GALLONS)

Is intended for all large Establishments where much watering is done by the watering-pot. By its use much time and labour of the Gardener are saved, particularly where the Tank, Pond, or Pump, is at a distance from the garden. May be obtained of any Ironmonger in town or country for 3*l.* 3*s.*

Manufactured by
John Warner & Sons, 8, Crescent, Jewin Street, London.

(Fig. 1.) (Fig. 2.)

J. TYLOR and SON'S BARROW GARDEN ENGINE (Fig. 1), in best well painted oak tub, fitted with improved Pump, universal joint, and registered Spreader, which answers the purpose of the separate rose fan and jet.

No. 1 holds	10 gallons,	throws	30 feet high		...	£4	10
No. 2	„ 15	„	„ 45	„	...	5	10
No. 3	„ 28	„	„ 45	„	...	6	18

J. TYLOR & SON'S BARROW GARDEN ENGINE (Fig. 2), in strong tinned iron tub, well painted inside and outside, with improved Pump, universal joint, and registered Spreader, which answers the purpose of the separate rose fan and jet.

No. 10 holds	8 gallons,	throws	25 feet high		...	£2	15
No. 13	„ 12	„	„ 30	„	...	3	5
No. 11	„ 16	„	„ 40	„	...	4	0
No. 12	„ 24	„	„ 45	„	...	5	0
No. 14	„ 30	„	„ 45	„	...	5	18

A large assortment of every description of Garden Syringes, Pail Engines, Conservatory Pumps, &c., kept in Stock.

No. 1, Plain Syringe, with rose and jet, diameter of barrel, 1¼ inch, 14*s.* 3*d.*; No. 2, do., diameter of barrel, 1⅜ inch, 12*s.*; No. 3, do., diameter of barrel, 1⅜ inch, 10*s.* 6*d.*

Read's Syringe, with two roses and one Jet, 19*s.*

J. Tylor & Son's Horticultural Apparatus may be obtained at these prices from any respectable Ironmonger or Seedsman in town or country, through whom alone they will be supplied, and of whom Drawings and Prices may be had.

N.B. Cost of carriage, &c., not included in these prices.

J. Tylor & Son's Manufactory, Warwick Lane, Newgate Street, London.

J. TYLOR and SON'S REGISTERED GARDEN SYRINGE. Small size, for Amateur use, **21s.** each. Large size, for Gardeners' use, **25s.** each.

Extra for Telescope Tube as shown in engraving for watering plants on stands at a height of 8 feet, so that any quantity of water can be deposited in the pot without wetting the leaves, 10*s.*

By a simple arrangement this Syringe is rendered more effective than any portable Conservatory or Garden Pump ever offered to the public. It is equally adapted for Garden or Conservatory use, and is capable of discharging twice as much water in a given time as any other Syringe now in use. The arrangement consists in attaching a small flexible suction tube to the barrel of the Syringe, through which it is filled with water at every discharge of the previous contents. By this means the Syringe is always charged, and the pull-up stroke of the piston rendered perfectly easy, it having, indeed, no work to do, the barrel being previously full of water. Being thus made self-supplying, a great saving of labour is effected; and the necessity of stooping to fill the syringe at every discharge being done away with, the direction of the water can be maintained for any length of time. It is perfectly cleanly in its action, as it is not possible for any water to get on the outside of the barrel, which is a well-known inconvenience attendant on the use of every other Syringe. Its construction is perfectly simple, and cannot get out of order; the ground in ball valves and fittings used for filling all other patent Syringes being entirely superseded. To be had of any respectable Ironmonger or Seedsman in town or country.

J. Tylor & Sons, Manufacturers of Horticultural Apparatus Warwick Lane, Newgate Street, London.

N.B These prices do not include carriage, package, or expense of delivery in the country.

HORTICULTURAL WORKS AND HOT-WATER APPARATUS MANUFACTORY.

KENSAL GREEN, HARROW ROAD, LONDON.

JOHN TAYLOR AND SON beg to call the attention of the nobility and gentry to the very superior manner in which they Erect all kinds of Conservatories, Vineries, Greenhouses, &c., combining every improvement with elegance of design, and durability of materials and workmanship.

Their VENTILATING APPARATUS for the Fronts and Roofs of Houses has given the highest satisfaction. Churches, Chapels, Schools, Entrance Halls, Public Buildings, &c., heated with Hot-Water Apparatus in a most economical and efficient manner. J. T. & SON have great pleasure in referring to numbers of the nobility and gentry by whom they are extensively engaged.

HORTICULTURE IN ALL ITS BRANCHES.

JOHN WEEKS & Co., King's Road, Chelsea,

HOTHOUSE BUILDERS.

THE NOBILITY AND GENTRY about to erect Horticultural Buildings, or fix Hot-water Apparatus, will find at our Horticultural Establishment and Hothouse Works, King's Road, Chelsea, an extensive variety of Hothouses, Greenhouses, Conservatories, Pits, &c., erected, and in full operation, combining all modern improvements, so that a lady or gentleman can select the description of House best adapted for every required purpose.

The HOT-WATER APPARATUS, which passes through all the Houses and Pits, affording both top and bottom heat, is in constant operation and particularly worthy of attention.

Many of the Houses and Pits are of wide and lofty dimensions, and together equal in length 1000 feet. They are all effectually heated by *one boiler*, which, during the severe winter months does not cost in labour and fuel more than 3*s*. 8*d*. per day, and the apparatus is so arranged that each House or Pit may be heated separately and to the required temperature. The splendid collections of Stove and Greenhouse Plants are also in the highest state of cultivation, and for sale at very low prices. Also a fine collection of strong Grape Vines in pots, from eyes, all the best sorts.

Plans, Models, and Estimates of Horticultural Buildings; also Catalogues of Plants, Vines, Seeds, &c., forwarded on application to JOHN WEEKS & CO., King's Road, Chelsea, London.

HOTHOUSES, CONSERVATORIES, FRAMES & LIGHTS FOR PITS, CUCUMBER & MELON BOXES & LIGHTS.

JAMES WATTS, HOTHOUSE BUILDER, 8, Claremont Place, Old Kent Road, London.

Green and Hothouses, 9, 10, 11, 12, 13, and 14 feet wide, any length, from 16 to 100 feet. Frames and Lights for Pits, 6 ft. 6 in., 7 ft., 7 ft. 6 in., 8 ft., and 8 ft. 6 in. wide, any length, from 12 to 100 feet. Upwards of 200 Cucumber and Melon Boxes and Lights, from 4 ft. by 3 to 10 ft. 6 in. by 5 ft. 6 in., kept ready, glazed with stout sheet glass, painted four times, complete, ready for immediate use, all made of best material, packed and sent to all parts of the kingdom.—Reference may be had to the Nobility Gentry, and the Trade, in most of the counties in England.

HOW TO KILL RATS, MICE, AND MOLES BY HUNDREDS.—A Method will be forwarded with instructions for 30 postage stamps, which will destroy the above vermin quickly and without trouble. 1000 acres may be cleared for a few shillings.

BEE HIVES.

NEIGHBOUR'S IMPROVED COTTAGE BEE-HIVE, as originally introduced by GEORGE NEIGHBOUR & SONS, with all the recent improvements, glasses, thermometer, &c., price 35*s*., securely packed for the country.

This unique hive has met with universal commendation, and may be worked with safety, humanity, and profit, by the most timid; its arrangements are so perfect, that the honey may be taken at any time of the gathering season without at all injuring the bees.

Early applications, addressed to GEO. NEIGHBOUR & SONS, 127, High Holborn, or 149, Regent Street, London, will receive prompt attention. Their newly arranged Catalogue of other improved Beehives, with Drawings and Prices, sent on receipt of two stamps.

Agents:—Manchester, HALL & WILSON, 50, King Street; Liverpool, JAMES CUTHBERT, 12, Clayton Square; Chester, F. & A. DICKSON & SONS, 106, Eastgate Street; Glasgow, AUSTEN & M'ASLAN, 186, Trongate Street; Dublin, J. EDMUNDSON & Co., 61, Dame Street.

IMPORTANT TO GROWERS OF ROSES.

NEWLY-INVENTED APHIS BRUSH, OR GREEN FLY DESTROYER.—The attention of Florists is particularly called to this Cheap and Ingenious Instrument, invented by the Rev. E. S. BULL, of Colchester, which, in a very simple and easy manner, instantly cleanses the Rose from that destructive insect the Green-fly (or Aphis), without causing the slightest injury to the bud or foliage.

Price 2*s*. 6*d*. each, or free by post, 4*s*.

MANUFACTURED BY

JOSLIN AND SONS,

IRONMONGERS, Colchester.

Retailed by all the principal Ironmongers.

Wholesale Agents:

W. THOMPSON & SON, 15, Upper North Place, Gray's Inn Road, London.

THREE PATENTS of great worth and utility for Sale, most valuable to any person or party desirous of exhibiting at the Paris Exhibition.—Apply to Mr. W. NEWMAN, 7, St. Giles Street, Norwich.

COTTAM AND HALLEN have on Show, at their Repository, No. 2, Winsley Street, Oxford Street, London, a great variety of the following articles for the Garden, &c., at very low prices, viz.:—Garden Rollers, Cast-Iron Rickstands, Garden Engines, Mowing Machines, Garden Chairs, Superior Garden Tools of all kinds, Garden Vases and Pedestals in great variety, and a large assortment of Horticultural and Agricultural Implements.

RICHARDSON, 21, Tonbridge Place, New Road, London.

HAY-MAKING MACHINES.—These desirable Machines for securing the Hay crop quickly and in perfect condition, are by NICHOLSON's Patent Improvements brought to a perfection not before attained, and without increase of cost. Full particulars, with engraving free by post, on application to W. N. NICHOLSON, Implement Manufacturer, Newark. They may be seen at the Agricultural Implement Department, Baker-street Bazaar, London, and at the Crystal Palace, Sydenham.—May be had of STANLEY, Peterborough; JOHNSON, Leicester; SHARMAN, Wellingborough; PERKINS, Hitchin; SMITH & SONS, Whitchurch; and other respectable Implement Dealers. Purchasers are respectfully cautioned not to be persuaded to purchase machines by other makers, without due inquiry both as to improvements and price.

SAMUELSON'S REGISTERED LAWN MOWING MACHINES. To cut 16, 19, 22, and 25 inches wide. The Registered Improvement renders unnecessary the great care requisite in the handling of these Machines on the old plan. All that is now required can be done *by any unskilled labourer*, who has only to push the Machine before him, the Registered Adjustment insuring a clean cut of uniform height, and preventing the knives from cutting into the soil, however uneven the ground may be. Illustrated Price Lists, with copies of Testimonials, and a Catalogue of his other Agricultural Implements, may be procured, post-paid, on application to the Manufacturer,

B. SAMUELSON, Britannia Works, Banbury, Oxon.

The above may also be procured at the principal Agricultural Implement Depôts in London, and of all respectable Ironmongers and Seedsmen in the country.

BLACK JAPAN VARNISH.—This article will be found from its durability and cheapness of the greatest utility for Painting Hurdles, Wire-work, Palings, Gates, Fences, &c. and out-door work of every description, whether of Wood or Iron. Its value has been proved by the test of time. It should be well stirred up before using and applied cold. This Varnish will retain its quality for any length of time, provided the cask be kept closed.

May be obtained through any ironmonger; or of JOHN WARNER & SONS, Irwin Crescent, London.

N.B. Sold in casks containing 28, or 14 gallons, at 2*s.* per gallon. Casks (which cannot be returned), 5*s.* each.

FOR WATERING GARDENS.

HANCOCK'S IMPROVED VULCANISED INDIA-RUBBER HOSE AND TUBING is now manufactured especially for the above purpose; is of greater flexibility than any other description of Hose; is capable of resisting great pressure, and made suitable for attaching to the mains of waterworks, or to tanks of high elevations.

WATERING HOSE fitted up with the necessary *brass joints*, *syphons*, and *spreaders complete*.

VULCANISED INDIA-RUBBER SUCTION PIPES, made any length or size for Pumps or Garden Engines.

VULCANISED RUBBER WASHERS, and also in Sheet, any thickness, for all kinds of steam and water joints, or made any size or figure to order.

All communications and orders punctually attended to, addressed to the Manufactory, JAS. LYNE HANCOCK, Goswell Road, London.

HOSE PIPING.

TO ENGINEERS, AGRICULTURISTS, GARDENERS, SHIP CHANDLERS, AND FIRE BRIGADES.

WAITHMAN'S PATENT FLAX TUBING (¾ in. to 3 inches in diameter) will sustain a greater pressure, is lighter, less bulky, will wear longer, and is about 60 per cent. cheaper than the leather hose pipe. Manufactured only by WAITHMAN & Co., Bentham, Lancaster.

PRICES IN DIAMETER AND PRICE PER YARD.—¾, 11*d.*; 1, 1*s.* 1½, 1*s.* 4½; 1½, 1*s.* 5*d.*; 1¾, 1*s.* 7*d.*; 2, 1*s.* 9*d.*; 2¼, 2*s.*; 2½, 2*s.* 3½, 2½, 2*s.* 6*d.*; 3, 2*s.* 9*d.*

Testimonial from Mr. Wright, Lancaster.—I beg to inform you that I yesterday tested your piece of 2½ inch Patent Flax Tubing, in connection with the Lancaster Waterworks, in the presence of the Mayor, Mr. Rawlinson, Government Inspector, Professor Owen, &c. The column of water at which the tubing was tried was equal to 340 feet in height, or about 150 lbs. on the square inch, and I have pleasure in stating that the hose sustained this pressure most admirably.

Testimonial of Captain Martin, of the Great Britain Steam Ship.—I have much pleasure in being able to tell you that your hose, attached to the Great Britain and other ships, is well worth the attention of ship owners. It gives us great satisfaction.

Testimonial from Fairbairn & Co., of Leeds.—We have tested your hose, 2½ inch in diameter, with the pressure of the Leeds Waterworks, and found it highly satisfactory.

GLASS FOR CONSERVATORIES, GREENHOUSES, PIT FRAMES, ETC.

T. TRELOAR, Cocoa-nut Fibre Manufacturer, 42, Ludgate Hill, London.

"FRIGI DOMO."—Patronised by her Majesty the Queen, the Duke of Northumberland for Syon House, His Grace the Duke of Devonshire for Chiswick Gardens, Professor Lindley for the Horticultural Society, Sir Joseph Paxton for the Crystal Palace, Royal Zoological Society, Mrs. Lawrence, of Ealing Park, and — Collier, Esq., of Dartford.

PROTECTION FROM MORNING FROST.

"FRIGI DOMO," a Canvas made of patent prepared Hair and Wool, a perfect non-conductor of Heat and Cold, keeping, wherever it is applied, a fixed temperature. It is adapted for all horticultural and floricultural purposes, for preserving Fruits and Flowers from the scorching rays of the sun, from wind, from attacks of insects and from morning frosts. To be had in any required length, 2 yards wide, at 1*s.* 6*d.* per yard run, of ELISHA THOMAS ARCHER, whole and sole manufacturer, 7, Trinity Lane, Cannon Street, City, and the Royal Mills, Wandsworth, Surrey; and of all Nurserymen and Seedsmen throughout the kingdom. "It is much cheaper than mats as a covering."

COWS.

HARVEY'S CELEBRATED COW DRINKS, 1*s.* each, have been used with great success. Plain directions are given with each Drink for the treatment of most diseases incidental to Cows, for which they will be found a safe and effectual remedy. One Drink given at the commencement of the Tick, or Feet and Mouth Distemper, will perfectly eradicate it in a few days.—Compounded by R. HARVEY, Veterinary Surgeon, Macclesfield, Cheshire. Sold by all Medicine Vendors. Wholesale Agents, BARCLAY & SONS, and MARSDEN & SONS, London.

AT MR. MECHI'S ESTABLISHMENTS 112, Regent Street, 4, Leadenhall Street, and Crystal Palace, are exhibited the finest specimens of British manufactures in Dressing Cases, Work-boxes, Writing Cases, Dressing Bags, and other articles of utility or luxury. A separate department for Papier Maché Manufactures and Bagatelle Tables. Table Cutlery, Razors, Scissors, Penknives, Strops, Paste, &c. Shipping orders executed. Superior Hair and other Toilet Brushes.

THE COMFORT OF A FIXED WATER-CLOSET FOR £1.—Places in gardens converted into comfortable Water-closets by the PATENT HERMETICALLY SEALED PAN, with its self-acting valve, entirely preventing the return of cold air or effluvia. Any carpenter can fix it in two hours. Price 1*l.* Hermetically-sealed Inodorous Chamber Commodes, 1*l.* 2*s.*, 2*l.* 4*s.*, and 3*l.*; also Improved Portable Water-closets, with pump, cistern, and self-acting valve. A Prospectus, with Engravings, forwarded by enclosing two postage stamps

At FYFE & Co.'s Sanatorium, 46, Leicester Square, London.

METCALFE AND CO.'S NEW PATTERN TOOTH BRUSH, PENETRATING HAIR BRUSHES, AND SMYRNA SPONGES.—The Tooth Brush performs the highly-important office of searching thoroughly into the divisions and cleansing in the most extraordinary manner—hairs never come loose. Peculiarly penetrating Hair Brushes, with durable unbleached Russian bristles, which will not soften like common hair, and immense stock of genuine unbleached Smyrna Sponge, with every description of British and Foreign Perfumery, at METCALFE, BINGLEY, & Co.'s only Establishment, 130 B and 131, Oxford Street, second and third doors west from Holles Street.

CAUTION.—Beware of the word "from" Metcalfe's, adopted by some houses. Metcalfe's Alkaline Tooth Powder, 2*s.* per box.

TO SEEDSMEN AND OTHERS.

WANTED TO RENT on or before Michaelmas next, by a responsible Tenant, an established SEED BUSINESS, within an easy distance of London; a Shop in conjunction with a Nursery would not be objected to, or private residence with few acres of good arable or pasture land attached.—Apply, stating rent, &c., to Y. Z., Mr. Macaulay, Stationer, Rochester, Kent.

TO NURSERYMEN.

TO BE LET, for a term of 7 or 14 years, a small compact NURSERY, well stocked, and containing Hothouses and Greenhouses, Pits, Frames, Potting Shed, and other conveniences for the business; situate in the rapidly rising town of Weston-super-Mare, in the county of Somerset. There is a neat and comfortable Gothic Cottage, Stable, Cart-house, and other out-buildings upon the premises. The above affords an excellent opportunity to any person with a moderate capital who is acquainted with the trade, as there is no other business of the kind in the town or within 20 miles of it. Satisfactory reasons will be given for the present proprietor declining the trade.—Apply to the proprietor, Mr. THOMAS TAYLOR, at the Weston-super-Mare Nursery, Somerset.

TO NURSERYMEN AND OTHERS.

TO BE SOLD, a good GREENHOUSE in capital condition, having a hot-water apparatus and fittings complete. The above may be seen on the grounds at Wooburn House, and particulars obtained on application to Mr. H. SIMMONDS, Upholsterer, Auctioneer, &c., High Wycombe, Bucks.

NURSERY AND SEED BUSINESS.

TO BE SOLD, or LET for a term of years, a Nursery, Seed and Plant Business, which has been successfully carried on for the last 35 years in a rapidly rising and most fashionable watering-place in the south of England. The Nursery grounds are advantageously situated in the midst of the town, within half a mile of the Railway Station, and close to its principal entrance is the large Seed and Show Shop. The Grounds comprise about eight acres of good land, and four large Glass Structures, heated with hot water, with several pits and Frames, the whole being well furnished with a Young and Saleable Stock. Any person wishing to carry on the above business will find this well worthy of attention. Satisfactory reasons will be given for the retirement of the present proprietor.—For further information apply to Messrs. E. G. HENDERSON & SON, Wellington Road, St. John's Wood, London.

TO NURSERYMEN.

TO BE SOLD, by Private Contract, either altogether or in Lots to suit Purchasers, the long established and flourishing NURSERY PREMISES of the late Mr. George Clarkson, Fulford Road, York, stocked with Forest and Fruit Trees, Shrubs, &c.; and having a substantial Dwelling-House, Shops, and Greenhouse, and other requisite Outbuildings attached.—Plans and Particulars may be had on application to Mr. LUKE THOMPSON, Solicitor, Judge's Court, York.

GOLDEN PHEASANTS' EGGS, fresh from first-rate birds.—For price, &c., address GEORGE ROBERTS, Gamekeeper, Hunmanby, Scarborough, Yorkshire.

Sales by Auction.

FANCY POULTRY PERIODICAL SALE.

MR. J. C. STEVENS will sell by Auction, at his Great Room, 38, King Street, Covent Garden, on TUESDAY, 19th June, at 12 o'clock precisely, POULTRY OF CHOICE QUALITY, including Speckled Dorkings of great weight, Spanish, White Cochins, from the yard of J. Turner, Esq., Exeter. These birds are well worthy the attention of amateurs, having taken first prize last year at Birmingham and all the West of England shows; Bantams and some good Pigeons.—May be viewed on the morning of sale, and Catalogues had by enclosing a stamped directed envelope to Mr. J. C. STEVENS, 38, King Street, Covent Garden.

TO GENTLEMEN, FLORISTS, AND OTHERS.

WINDING-UP SALE FOR THE SEASON.

MESSRS. PROTHEROE AND MORRIS will Sell by Auction, at the Mart, Bartholomew Lane, on THURSDAY, June 21, at 12 o'clock, a first class collection of DAHLIAS, consisting of the finest varieties of 1855; also Fuchsias, Verbenas, Calceolarias, Petunias, fine Roses, choice Geraniums, and other plants in bloom, with a large assortment of Ornamental Plants for Bedding. On view the Morning of Sale.—Catalogues had at the Mart, and of the Auctioneers, American Nursery, Leytonstone, Essex.

ORCHIDS.

MR. J. C. STEVENS will Sell by Auction, at his Great Room, 38, King Street, Covent Garden, on TUESDAY, 26th June, at 12 for 1 o'clock, a collection of ORCHIDS, established healthy plants of Vanda, Ærides, Cattleyas, Dendrobiums, Oncidiums, Stanhopeas, &c., &c., the private collection of a gentleman.—May be viewed on the morning of sale, and Catalogues had of Mr. J. C. STEVENS 38, King Street, Covent Garden.

ROYAL BOTANIC GARDENS, REGENT'S PARK.

List of Prizes Awarded at the Exhibition held on Wednesday, June 13, 1855.

ROYAL BOTANIC SOCIETY, Regent's Park.—The LAST EXHIBITION this season of PLANTS, FLOWERS, and FRUIT will take place on WEDNESDAY, July 4th. Tickets to be obtained at the Gardens only, by orders from Fellows or Members of the Society. Price 5*s*., or on the day of Exhibition, 7*s*. 6*d*. each.

N.B. By accident some of the tickets issued are wrongly dated July 5th instead of Wednesday, July 4th. The holders of such Tickets are requested to correct the date.

ROYAL SOUTH LONDON FLORICULTURAL SOCIETY, under the Patronage of her most gracious Majesty the Queen.—The Third Exhibition of the season will take place at the Royal Cremorne Gardens, Chelsea, on THURSDAY, July 5. Open to all Exhibitors. Prizes will be awarded for the following productions, viz.:—Collections of Miscellaneous Plants, Cape Heaths, Orchideous Plants, Pelargoniums, Variegated Plants, Fuchsias, Roses, Pinks, Verbenas, Cut Flowers, and Fruit; also numerous extra Prizes offered by members. Lists of Prizes and the Rules of the Exhibition may be obtained of Mr. Simpson, Royal Cremorne Gardens, Chelsea; and of the Secretary, Ebenezer House, Peckham, John Taylor Neville.

SOUTH LONDON SOCIETY OF AMATEUR FLORISTS.—The THIRD EXHIBITION for this season will take place at the Horns Tavern, Kennington, on FRIDAY, 29th June, when Prizes will be awarded for the following productions, viz., Miscellaneous Plants, Pelargoniums, and Fancy Varieties, Pinks, Ranunculuses, Roses, &c. An efficient Band will be in attendance. Admission to Non-Members from 2 till 7 o'clock, at 6*d*. each. List of Prizes and the Rules for the Exhibitors may be had from John Bushell, Hon. Sec., *pro tem*. Lower Kennington, Lambeth.

STAINES HORTICULTURAL SOCIETY.—The Exhibition of the above Society will be held on SATURDAY, June 30, when Prizes will be awarded for the best productions of Amateur Gardeners and Nurserymen. Schedules of particulars may be had on application to W. Watkins, Hon. Sec., Staines.
(By order of the Committee.)

HORTICULTURAL AND FLORICULTURAL SOCIETY.—The First Grand Show of the above Society will be held by permission of the Earl of Essex in Cassiobury Park, near Watford, on WEDNESDAY, 18th July, 1855. An efficient Band on the grounds. Open to all Exhibitors. Schedules are now ready, and can be had on application to the Secretary, Mr. J. P. Taylor.
By order of the Committee,
John Pearce Taylor.

SLEAFORD FLORAL AND HORTICULTURAL SOCIETY.—At the Annual Exhibition of this Society at Sleaford, on THURSDAY, the 26th of July next, an Extra Prize of Five Guineas, open to all England, will be awarded for the best collection of Twelve Stove and Greenhouse Plants, in addition to the usual Members and Cottagers' Prizes. The rules of the Society, with Schedules of Prizes, may be obtained on application to Mr. Warwick, the Treasurer; or to Mr. Peake, Honorary Secretary.—Sleaford, June 23.

BRIGHTON AND SUSSEX FLORICULTURAL AND HORTICULTURAL SOCIETY, Royal Pavilion. The SECOND ANNUAL SUMMER EXHIBITION of PLANTS, FLOWERS, FRUITS, &c., will be held on Wednesday and Thursday, the 27th and 28th of June next, on the same grand scale as last year. Schedules can be had by application to E. Spary, General Superintendent of the Exhibition, or of the Secretary, E. Carpenter, 45, Lavender Street, Brighton.
By the liberality of the London, Brighton, and South Coast Railway Company all plants will be conveyed to the exhibition and back carriage free from all stations on the lines.
By order of the Committee, Edward Carpenter.
N.B. The Autumn Exhibition will take place on the 12th and 13th of September next.

GARDENERS' ROYAL BENEVOLENT INSTITUTION.—Notice is hereby given, that an ELECTION OF THREE PENSIONERS on the Funds of this charity will take place on Wednesday, the 4th of July next, at the Horticultural Society's Rooms, No. 21, Regent Street. The chair to be taken at 12 o'clock precisely.
The Polling Papers have all been delivered; any Subscriber not having received one is respectfully requested to apply for one immediately.
June 23. E. R. Cutler, Sec.,
14, Tavistock Row, Covent Garden.

GARDENERS' BENEVOLENT INSTITUTION.—Thomas Jackson & Son respectfully recommend to the Members of the above Institution GEORGE KIDD, aged 70, who has followed gardening for 54 years, was a subscriber to the Institution 9 years, and now, from a fall rendering one hand powerless, combined with age, he is unable to work. His case is strongly recommended by Mr. T. Gaines, Battersea; Mr. F. King, Isleworth. Proxies will be gratefully received by T. Jackson & Son, Kingston, Surrey.

TURNIP SEED OF PURE SELECTED STOCKS. FOR

BASS AND BROWN'S Advertisement of present prices, see *Gardeners' Chronicle* of April 28th, and May 5th and 12th. Reduced prices for large quantities.
Errata.—For "Laing's Purple-top Swedes, 1*s*. per lb.," *read* "1*s*. 9*d*. per lb." the same price of the other three Swedes.
To the Trade.—Prices will be supplied on application.
Seed Establishment, Sudbury, Suffolk.

THE BEST EARLY CABBAGE GROWN.

COTTRELL'S EARLY CHAMPION may be sown any season. Sold in sealed packets, 1*s*. per oz. The usual allowance to the Trade.—To be had only of Dawe, Cottrell, & Benham (Successors to F. Warner), Wholesale Seedsmen, 3, Lawrence Pountney Lane, and 36, Moorgate Street (late 28, Cornhill). Established 1720.

ENGLISH GROWN RAPE, OR COLE SEED.

CHARLES SHARPE AND CO. beg to acquaint the Trade that they can supply any quantity of the above; prices and samples forwarded on application.
Nursery and Seed Establishment, Sleaford, June 23.

JOHN COLES begs respectfully to invite lovers of SHRUBBY CALCEOLARIAS to pay him a visit, and flatters himself his batch of Seedlings are second to none in England, and that no one will regret the journey.
Keyfield Nursery, St. Alban's, June 23.

CHINESE PÆONIES.

JOHN SALTER'S unrivalled collection of these splendid Flowers is now in bloom, and may be seen every day except Sunday.—Versailles Nursery, William Street, near Hammersmith Turnpike.

EMPEROR NAPOLEON—A New Scarlet Geranium.

JOHN BUTCHER is now sending out the above splendid GERANIUM (a Seedling raised by himself), being a very decided improvement upon the great favourite Tom Thumb; the habit is more compact, the trusses of Flowers very much larger, and for brilliancy of colour far superior, sending up the truss of Flower finely above the Foliage. Fine for Bedding or Vases. Was exhibited at the Royal Botanic Gardens, Regent's Park, London, June 13 (see *Gardeners' Chronicle* of June 16).—June 23.

DENNIS'S SPLENDID GERANIUM ALMA.—Flowers large, bright rosy crimson, very abundant, blooming freely from February to December; the very best ever grown for all general purposes.
Good blooming Plants ... 25*s*. to 30*s*. per dozen.
Large strong Plants ... 50*s*. to 70*s*. "
W. Dennis, Florist, King's Road, Chelsea.

WILLIAM KNIGHT, Florist, &c., begs to offer the following Superb FLOWER SEEDS, saved from the best varieties, post free:—

	Per packet—*s*.	*d*.
Calceolaria, from the best spotted varieties	1	0
Cineraria, from the newest and best varieties	1	0
Primula sinensis, from choice fimbriated varieties ...	1	0
Double Daisy from 60 of the newest varieties	0	6
Pansy, from 100 of the best show flowers	1	0
Antirrhinum, from 100 striped and spotted varieties ...	0	6

67, High Street, Battle, Sussex.

MESSRS. E. G. HENDERSON AND SON beg to announce that their NEW SPRING CATALOGUE for 1855 will be sent post free on application, and for 12 postage stamps a Beautiful Coloured Plate, representing the following choice plants:—

Achimenes Ambroise Verschaffelt.
Acacia Drummondi microphylla
Boronia Drummondi
Bouvardia longiflora
Delphinium Hendersoni
Genetyllis macrostegia (fuchsioides)
Fuchsia Queen Victoria
" Mrs. Story
" Prince Albert

Mr. Andrews, the first floricultural artist of the day has had the getting up of this Plate, so that full reliance may be placed on the correctness of the flowers represented and the superior style of colouring.—Wellington Nursery, St. John's Wood, June 23.

WHITE LISBON ONION SEED.—Large buyers can be supplied with White Lisbon Onion Seed in quantity.—Apply to Mr. Henry Clarke, Seed Merchant, 39, King Street, Covent Garden.

ERICA VENTRICOSA, 12 distinct varieties.—A large quantity of very fine Plants in 48 pots, well set with Flowers, and now in fine condition for travelling. Price per 100 or per dozen on application to Hugh Low & Co., Clapton Nursery, London.

GARCINIA MANGOSTANA.—Healthy plants from seed of the true fruiting MANGOSTEEN at 63*s*. each.—Hugh Low & Co., Clapton Nursery, London, June 23.

ORANGE TREES of different sizes, on stems varying in height from 1 to 4 feet, all in vigorous health, and many full of flower. Prices from 21*s*. to 105*s*.—Hugh Lo & Co., Clapton Nursery, London.—June 23.

ALOE.

TO BE SOLD, an ALOE, now coming into bloom. At present it is 13 feet high from the ground. It will be delivered at either the Wokingham or Windsor Stations.—Offers for the same will be received by J. H., 20, Baker Street, Portman Square, London.

TO BE SOLD, about 66 plants of CRASSULA COCCINEA, just coming into bloom, at 6*d*. each; also a dozen extra large at 9*d*. each. For ready money only.
W. H., Post Office, Upholland, Wigan, Lancashire.

DUTCH BULBS.

AS the period is approaching for sending out the orders for DUTCH BULBS for the ensuing season, we respectfully suggest to our friends and the trade generally, that they instruct their correspondents in Holland to consign the cases to our care here, for immediate transmission to their respective destinations, by which greater expedition will be obtained in their delivery.—Betham & Blackith, Custom House and General Forwarding Agents, Cox's Quay, Lower Thames Street, London.—June 23.

EXHIBITION OF AMERICAN PLANTS.
Knap Hill Nursery, Woking, Surrey.

WATERER AND GODFREY beg to announce that the AMERICAN PLANTS at this Nursery are now in great beauty, and may be seen daily gratis. The Nursery is readily reached by Railway to the Woking Station, where capital conveyances may always be obtained.

GREAT EXHIBITION OF AMERICAN PLANTS.

JOHN WATERER begs to announce that his unrivalled collection of Hardy, Scarlet, and other RHODODENDRONS, is now on view at the Royal Botanic Gardens, Regent's Park, London. Orders of admission are granted gratuitously by Fellows of the Society. The Plants at the Nursery are now in full bloom, and will continue in perfection throughout the month of June.—The American Nursery, Bagshot, Surrey, June 16.

GAINES' LARGE COLLECTION OF SHOW, FRENCH, and FANCY GERANIUMS, are now in full bloom. May be seen any day, Sundays excepted. There are hundreds of feet of stages perfectly filled with all the choicest kinds. Persons wishing to improve their Collection would find a visit to the Nursery answer their purpose.
Nursery, Surrey Lane, Battersea, June 23.

AZALEAS AND ERICAS.

W. J. EPPS has much pleasure in offering the following fine, bushy, well-grown plants, and of the choicest and best varieties, in large 48 and 32-size pots.
AZALEAS 18*s*. per dozen; 5*l*. per 100.
ERICAS 12*s*. and 18*s*. per dozen; 4*l*. and 5*l*. per 100.
These will make very pretty specimens for the ensuing season all orders to be accompanied with a remittance from unknown correspondents.—Maidstone, June 23.

WILLIAM BARRATT, Landscape Gardener, Wakefield.
*** Plans and Estimates furnished.

DAVID FERGUSON, Landscape Gardener, Garden Architect, and Contracting Planter, Stowe, Buckingham. Now is the time to prepare for planting in September, October, and November.

JOHN HARRISON, Nurseryman, Seedsman, Florist, Landscape Gardener, &c.
Plans and Estimates furnished; Experienced Gardeners recommended; also several Young Men in the Nursery waiting for Under Gardeners' Situations.—Darlington, June 23.

GEORGE TAYLOR, Jun.,
Choice Fruit and Vegetable Salesman,
St. John's Market,
Liverpool.
Contractor and Purchaser of Choice Garden Produce.
Salesman on Commission.
Terms, Cash.
Forward as above.

JOSEPH NORRIS, Osterley Park, Hounslow, Middlesex, having an immense Stock of PANSIES, including all the finest and newest in cultivation, offers them at 6*s*., 9*s*., and 12*s*. per dozen, package included, sent to any address on the receipt of a Post Office Order, payable at Hounslow.
The Trade supplied.

SUPERB HOLLYHOCKS, SEEDS, ETC.

WILLIAM CHATER begs to offer packets of seed, consisting of 20 varieties, from his best Show Hollyhocks at 5*s*.; 12 varieties, 2*s*. 6*d*.; and from good double sorts, 1*s*.
Superior Quilled German and French Asters, in 12 varieties, mixed, 1*s*. per packet; separate, 2*s*. Fine Quilled African Marigolds, 6*d*. per packet.—Saffron Walden Nurseries.

EXTRA FINE BEDDING PLANTS.

R. PARKER having a large surplus stock of the finest varieties of Fuchsias, Verbenas, Calceolarias, Dahlias, Petunias, Scarlet and Variegated Geraniums, and all the other popular varieties of bedding plants, is prepared to treat with purchasers on the most liberal terms. Prices forwarded upon application, per return of post.
Paradise Nursery, Hornsey Road, Holloway.

OPEN AIR CULTURE OF THE MUSHROOM.

PRESTOE'S IMPROVED MUSHROOM SPAWN.—The only acknowledged improvement from the time of Oldaker.—Sold in packages containing a sufficient quantity to plant 50 feet of bed for 5*s*., with printed description and cultural direction.
The Rev. Mr. J. Berkeley speaking of it in the *Gardeners' Chronicle*, says "it is really a valuable article." W. P. has also been honoured with the London Horticultural Society's Certificate of Merit for "Excellent Mushroom."—The trade supplied. Post Office orders payable to William Prestoe, Basingstoke, Hants.

EXTRA STRONG BEDDING PLANTS, 2*s*. 6*d*. per doz.
Including Package, when 10 doz. are Ordered.

WOOD AND INGRAM beg to offer, at the above price, fine well-established plants of Anagallis, Ageratum, Calceolaria, dark, Cineraria ameloides, Heliotropes, Lobelia ramosoides, Nierembergia gracilis, Petunias, Senecios, Tagetes lucida, and Verbenas, all of the best kinds, and in great variety. Also a large quantity of good flowering plants of Show and Fancy GERANIUMS, and Show and Fancy DAHLIAS, of well-known leading kinds, at from 4*s*. to 6*s*. per doz. The varieties to be sent may be seen in W. & I.'s Catalogue, which may be had on application.—Huntingdon Nurseries.

WHEELER AND SON'S SHORT SELECT SEED LIST.—Our Priced List of Seeds for this season, containing Descriptions and Prices of the best GARDEN and FLOWER SEEDS, will be forwarded free by post. It is our earnest endeavour to send out all Seeds, whether for the Garden or Farm, of the very best quality and true to name; and as many of the Seeds are our own growing, and are proved before sending out, we generally succeed in giving entire satisfaction to our customers.
We are in daily receipt of most gratifying letters and renewed orders from those we had the honour of serving last year; and as we deliver our Seeds Carriage Free, we very respectfully solicit the honour of an order from those who have not yet given us a trial.—J. C. Wheeler & Son, Gloucester, Seedsmen to the Gloucestershire Agricultural Society.

TO FLORISTS AND GARDENERS.

TO BE SOLD, A GREAT BARGAIN, by valuation or private treaty, a first-class stock of Geraniums, Fuchsias, Roses, Verbenas, Dahlias, Calceolarias, Mimulus, Chrysanthemums, Hollyhocks, Carnations, Picotees, Pinks, Phloxes, and a general good assortment of Plants for any one in the trade; consisting of a very large Greenhouse 150 feet long, Forcing and Propagating Houses, Cold Pits, and Box Lights, with all sorts of Tools for use; likewise three large Water Tanks, and a good supply of Water; Ground well laid-out; and also a good lot of Fruit Trees in full bearing.

N.B. Situated in Surrey, about nine miles from London, adjoining a railway station, and within half a mile of a good market town; a good Dwelling House upon the premises, can be taken by year or lease.

Dahlias from 3s. to 6s. per doz.; good sorts and strong plants.
Fuchsias „ 6s. to 12s. „ „ „
Verbenas „ 4s. to 6s. „ „ „
Pinks, Picotees, and Carnations, all named, equally cheap.
A good assortment of Bedding Plants cheap.—Apply to Mr. Hook, 21, Brudinell Place, New North Road, Hoxton.

TO NURSERYMEN AND GARDENERS.

REIGATE SILVER SAND, 12s. per ton, 1s. 6d. per bushel, or 16s. per ton, delivered to any of the London Wharfs or Railways, or within a circuit of five miles. Peat and Loam of various qualities. Sacks 2s. each.
Kennard Brothers, Swan Place, Old Kent Road.

GARDEN VASES, FOUNTAINS, ETC.

THOMAS SOMMERVILLE, Landscape Gardener, Nurseryman, Seedsman, and Florist, Garden Road, St. John's Wood, London, begs respectfully to inform the nobility, gentry, and his patrons generally, that he has entered into arrangements with an eminent company in Scotland for the sole disposal in London of their highly ornamental and very durable Vases, Fountains, &c., samples of which may be seen at his grounds in the Garden Road, as above.

T. S. has much pleasure in being the first to introduce to the notice of the public a highly ornamental Vase, capable of resisting the most severe weather, and at little more than half the cost of any other possessing the same qualities; and he has no hesitation in stating that a more suitable Vase for the growth of plants cannot be manufactured.

MacADAM'S BLIGHT COMPOSITION. — The superiority of the above having been thoroughly established throughout Great Britain, France, and Germany during the last three seasons, it is again offered in 1 lb. packets (with directions) at 3s. 6d. each, sufficient for 24 gallons of liquid wash. No plant grower should be without this invaluable remedy. (See *Gardeners' Chronicle*, &c.)—John Hayne, Agent, 8, Liverpool Street, City, London. Paid orders forwarded.

PAGE AND CO'S COMPOSITION FOR THE DESTRUCTION OF BLIGHT UPON ROSES, WALL-FRUIT TREES, CUCUMBERS, MELONS, VINES, STOVE AND GREENHOUSE PLANTS.—Extra Strong, 4s. per gallon, sufficient to make four (Jars and Barrels extra). Directions for use forwarded. Ten gallons and upwards carriage free to London.

After four years' extensive use by the most eminent Gardeners in the kingdom, the superiority of Page & Co.'s BLIGHT COMPOSITION is unquestionable, requiring only a trial to insure its general use for destroying every pest to which Plant and Fruit Growers are subject (without injuring the most delicate flowers or foliage) and promoting a luxuriant growth.

See two pages Testimonials, *Gardeners' Chronicle*, March 3, 1855.

Can now be obtained of

Messrs. Henderson & Co., Pine-apple Place, London

IMPORTANT TO GROWERS OF ROSES.

NEWLY-INVENTED APHIS BRUSH, or GREEN FLY DESTROYER—The attention of Florists is particularly called to this Cheap and Ingenious Instrument, invented by the Rev. E. S. Bull, of Colchester, which, in a very simple and easy manner, instantly cleanses the Rose from that destructive insect the Green-fly (or Aphis), without causing the slightest injury to the bud or foliage.

Price 2s. 6d. each, or free by post, 4s.

Manufactured by
JOSLIN AND SONS,
Ironmongers, Colchester.

Retailed by all the principal Ironmongers.

Wholesale Agents:
W. Thompson & Son, 15, Upper North Place, Gray's Inn Road, London.

Post Office Orders payable at City Road Branch.

JAMES W. WATTS, Gutta Percha Factory, 27, City Road.

NEW WHITE VERBENA—MRS. HOLFORD.

JOHN WESTWOOD having had this really good Verbena in his possession before any other florist, is now enabled to offer well established plants on the 15th July next, at 3s. 6d. each. It far surpasses both in size of truss and flower any Verbena yet raised, and has been justly awarded a First Class Certificate by the South London Floricultural Society, and pronounced by all who have seen it to be unequalled.

NEW PETUNIA—MARQUISE DE LA FERTE.

This Petunia was exhibited at the Horicultural Fete on Wednesday last, at Chiswick, and universally admired. It is a most decided improvement on Shrubland Rose in every respect. It is brighter and clearer in colour, a better grower, a larger flower, and has a beautiful clear white throat. Well established plants on the 15th July next, at 5s. each.

CHRYSANTHEMUMS.—Strong bushy plants fit to make fine specimen plants for the ensuing autumn of 120 sorts of Lilliputian, and 80 sorts of the large flowering kinds, at 6s. and 5s. per dozen.

The Floral Nursery, Acton Road, Turnham Green.—June 23.

Descriptive List may be had for one stamp.

It is respectfully requested that orders be accompanied with Post Office Order payable at Marsden, Lancashire, unless reference is given.

NEW AND CHEAP FIRST-RATE SHOW AND BEDDING PLANTS.

THE CHEAPEST ESTABLISHMENT IN THE KINGDOM IS AT

HENRY WALTON'S, FLORIST, &c., Edge End, Marsden, near Burnley, Lancashire, where there are propagated annually for sale from 20,000 to 30,000 plants, which, for cheapness and quality, are not to be equalled, being robust and healthy.

GERANIUMS.—Strong blooming plants, of varieties of 1853, such as Empress, Carlos, Neatness, Glow-worm, &c., 25s. per dozen; older show varieties, 9s., 12s., and 15s. per dozen; 25 for 20s.; 50 for 30s., good plants.

FUCHSIAS, new varieties of last season, 6s. to 9s. per dozen.

CINERARIAS, choice varieties, such as Advancer, Etoile de Vaise, Empress, &c., 10s. 6d. per dozen; older varieties, good show kinds, 3s. 6d. per dozen.

PANSIES, 12 distinct fine show varieties, 6s.; 25 fine vars., 12s.

VERBENAS, new varieties of last season, 4s. to 6s. per dozen.

DAHLIAS, all the leading show kinds of last season, 9s. to 12s. per doz.; older vars. 4s. 6d. to 6s. per doz., extra strong plants.

Bedding Plants, including Scarlet and other Geraniums Salvias, Heliotropes, &c., equally cheap.

H. W.'s Spring List may be had for one penny stamp.

It is respectfully requested that all Orders be accompanied with a Post-office Order, payable at Marsden, Lancashire, unless a reference is given. Orders to the amount of 25s. paid to Liverpool, Manchester, Leeds, and Preston; 2l. and upwards free to Birmingham and Carlisle; and the like distance, or more distant, extra plants gratis.—Edge End, Marsden, June 23.

NEW CABBAGE.—THE CHAMPION OF ENGLAND, which has surpassed everything of its kind during the past severe winter (when nearly every other has failed) and turned well into Cabbage this spring. This Cabbage is of a very dwarf and compact habit, and quite equal in flavour to any yet grown. It has been in the hands of a very excellent gardener for several years, and he has thoroughly proved its superior hardy and good qualities. The stock of seed purchased is very limited, therefore none can be sold by the pound or in large quantities to the Trade this year. E. T. feels confident, from what he has seen of the Cabbage, that it will give the greatest satisfaction to all purchasers. Sold in packets of 1 oz., 2s. 6d.; or of half an ounce, 1s. 6d., postage free.

The TRUE OLD BATH COSS LETTUCE, which Lettuce has never been surpassed by any other yet grown. 1s. per packet.

☞ This being the proper time for sowing the following varieties of Hardy Flowering Seeds for blooming next spring, the following undermentioned varieties will give the greatest satisfaction to all purchasers as they have hitherto done for many past seasons:—

SWEET WILLIAM SEED—Saved from 50 of the choicest and most superb varieties. 1s. per packet.

ANTIRRHINUM SEED—Saved from all the striped, spotted, and finest shaped varieties. 1s. per packet.

Superb HOLLYHOCK SEED — Saved from all the best named flowers out last year. 1s. per packet.

SCARLET GIANT BROMPTON STOCK, extra fine. 1s. per packet.

PANSY SEED—A few packets from selected varieties. 1s. per packet.

AQUILEGIA OR COLUMBINE SEED—Saved from 12 distinct varieties. 1s. per packet.

☞ Either of the above packets of Flower Seeds three for 2s. 6d.

A remittance must accompany every order either in cash or penny postage stamps, when the whole, or any part of the above (as the case may be) will be forwarded.

EDWARD TILEY, Nurseryman, Seedsman, and Florist, 14, Abbey Church Yard, Bath, Somerset.

NEW SCARLET VERBENA—"MRS. WOODROFFE."

ARTHUR HENDERSON AND Co. can now supply fine strong plants of this very fine new Scarlet Verbena, 4 to 6 inches high, with numerous side branches, and all well hardened, fit for immediate planting out, at the following reduced prices, viz.:—

1 Plant	...	...	1s. 6d.
12 Plants	...	...	12 0
25 Plants	...	...	22 0
50 Plants	...	...	40 0
100 Plants	...	...	70 0

Specimens of blooms can be sent per post in tin cases (on receipt of 6 Postage Stamps) to those who are desirous of seeing and judging for themselves of the merits of this splendid variety.

Pine Apple Place, Edgware Road, June 23.

ROBERT PARKER begs to inform his friends and the public that his New Spring Catalogue containing Descriptive and Priced Lists of the following:—

Exotic Orchids
Ferns—stove, greenhouse, and hardy
Geraniums—show, fancy, scarlet, variegated, and hybrid bedding varieties
Chrysanthemums—large flowered, and Pompone varieties

PLANTS OF CABBAGE, SAVOY, KAIL, BROCCOLI, CELERY, AND CAULIFLOWER.

JOHN CATTELL begs respectfully to inform the public that he has a plentiful supply of Plants of his superior true sorts of the above, which will be forwarded to order on receipt of Postage Stamps, or Post Office Order made payable here, at the following prices, package included:—

All the sorts of Early Cabbage, Savoy, and Kail, including Brussel Sprouts, 6d. per 100, 4s. 6d. per 1000; all the sorts of Broccoli, 8d. per 100, 5s. 6d. per 1000; all the sorts of Celery, bedded plants, 8d. per 100, 5s. 6d. per 1000; Cauliflower, early and late 10d. per 100; Red Cabbage, 1s. per 100; Drumhead, or Cattle Cabbage, 4s. per 1000. A fine stock of autumn-bedded early Cabbage still to dispose of at 5s. per 1000; for large quantities, price on application. Packages containing plants to the value of 1l. and upwards will be delivered carriage free to London and to the Edenbridge Station of the South Eastern Railway. A remittance must accompany orders from unknown correspondents. Seed of Cattell's Dwarf Barnes, and of his superior Dwarf Reliance Cabbage, may be had in packets by post, for 12 penny stamps per packet, the former containing one ounce, and the latter half an ounce.—Nurseries, Westerham, Kent.

RARE AND CHOICE SEEDS.

WILLIAM DENYER, SEEDSMAN AND FLORIST, 82, Gracechurch Street, London, offers the following:—

AQUILEGIA, 6 distinct and beautiful colours, 2s. These are quite hardy, and when planted out will last and flower for several years.

CALCEOLARIA, saved by an amateur from the most superb show flowers, 1s. per paper.

CINERARIA, from a splendid collection, 1s. per paper.

HOLLYHOCKS, from Chater's best varieties, 6 sorts, 2s.

STOCKS, Autumnal, or late flowering, 6 varieties, 2s.

" Emperor, or Perpetual, 6 vars., splendid, 2s. These are quite new, and different to any other Stock, being very double and of large growth, lasting and flowering for several years.

WALLFLOWERS, 6 gigantic double varieties, bright and singular colours, 2s. From a Continental grower, who has gained many first class prizes.

ANTIRRHINUM, from a superb collection, 1s. Saved by an amateur.

PRIMULA SINENSIS FIMBRIATA, 1s. Saved from the best fringed flowers.

PANSEY, from the best flowers, 1s. Saved by Thompson and other eminent growers.

NEW AND RARE PLANTS to be seen in blossom at the Tooting Nurseries:—

Azalea indica, gem, new
Barkeria melanocaulon, new
Cypripedium caudatum purpureum, new
" species; this truly magnificent new plant has been discovered by our collector, Mr. John Hensball, in Java, growing at an elevation of 7000 feet above the level of the sea
Erica obbata pulchella, new
" tricolor magnifica, new
" ventricosa flava, new
Ærides Larpentæ, rare
Geranium Empress, new. This variegated variety far exceeds both in foliage and blossom any other of this class, and is admirably adapted either for bedding or pot culture
Gloxinia Adamis oculata, new
Meyenia erecta; this unquestionably is the gem of the season in new plants
Rhododendron Stamfordiana, new
" pavonia, new
" Shakespeare, new
Uropedium Lindeni, rare

Messrs. WILLIAM ROLLISSON & SONS will be happy to forward their Priced Catalogue of New and Rare Plants, post free on application. They will also be forwarded throughout the following countries, post free:—America, Austria, Belgium, France, Germany, Holland, Prussia, &c.

The Gardeners' Chronicle.

SATURDAY, JUNE 23, 1855.

ON the morning of the 20th of June, that is to say last Wednesday, the thermometer fell in the garden of the HORTICULTURAL SOCIETY to 36°, and the radiator indicated 2° of frost: the wind blowing from the north-east. To this succeeded a sunny day which bore no trace of the previous cold, and enabled the garden of the Society to be seen to advantage by the visitors to the Second Exhibition there for the season. It has so constantly been our pleasant duty to point out the general horticultural excellence of these exhibitions, that we really have little to add to what has been so often said before. As usual there was scarcely a specimen unworthy of a good gardener; and the visitors who had been at the Sydenham show cannot have failed to perceive the wide difference between the horticulture of the Crystal Palace and the Chiswick Gardens. Indeed, the comparison was a common subject of conversation among the experienced gardeners who occupied the tents in the early morning, and we need not say that it was not flattering to the former.

Fruit, although this was not the day on which any unusual attempt was made to bring together a great exhibition, appeared in considerable quantity, and contained much that was excellent; by means of a circular table, decorated with plants, and skilfully arranged, it might have been seen to advantage by any number of spectators. Nothing was here more striking than the perfection to which growing Vines in pots has been carried; four plants thus managed, from the garden of the Baron DE ROTHSCHILD, were produced by Mr. FORSYTH, and excited great interest. The Peaches, especially those from Arundel Castle, were superb, and Grape growing could not be carried much further than in the case of admirable bunches of Black Hamburghs, from Trentham. Strawberries, too, especially some of MYATT's Cinquefoil sort, which we had not seen before, were splendid, but so cold has been the season that none came from the open ground, with one exception. This was a dish of Keens' Seedling, shown by Mr. ROKE of Chertsey, produced in the warm situation formerly the site of the Abbey garden there. From this favoured place green

Peas have been gathered as early as the 7th of May; this year a solitary small dish of Strawberries was all it could furnish.

While we bear willing testimony to the merits of the fruit growers, we must not omit to add that the judges complained of what is certainly a very objectionable practice. The Society offers prizes for *collections* of Peaches, each to consist of not fewer than two or three sorts. The judges reported that in some instances, instead of *sorts*, they found *names;* and they intimated that in future such collections would be held to be disqualified whatever their merit might be. We hope they will abide by their determination, for it must be owned that the neglect of ascertaining the correct names of fruits is a growing evil, which requires to be checked. A gardener who does not know the difference between a Noblesse, a Red Magdalen, or an Early Anne Peach may be, and often is a first-rate cultivator; but he only half understands his business for all that.

The same remark applies to the names given to plants. This has already been the subject of some correspondence in our columns, and we avail ourselves of the opportunity afforded by the Chiswick exhibition to offer a remark or two upon it. No one conversant with modern gardening can be ignorant that the names of plants in nurseries are too often false, or fanciful, or altogether delusive. We continually see countries ascribed to plants, with the utmost confidence, although the latter never had the smallest intercourse with the former. Species from Mexico are fastened upon the Gold coast, Chinese plants are said to be Brazilian, well-known Nilgherry forms are asserted to have come from Western Africa, and so on. In these cases it would seem that the owners of such plants know less of geography than a parish schoolboy. In other instances, where a plant has half a dozen aliases, every one of these is used to sell it by, although the owners must, or certainly ought to, know that they all stand for the same thing. Then again a plant already provided with a name in works accessible to anybody, is thrust forth into the world with a new one invented by some ingenious gentleman in the trade. Another mode of perplexing buyers is for every recipient of a new introduction, for which no scientific name has been found, to give it one of his own, too often with some magnificent meaning to entrap the unwary; hence the splendidums, and gloriosums, and speciosissimums, and superbums, and maximums in which so many modern productions are made to rejoice. A whimsical example of this has just occurred to us in the case of a very handsome *scarlet Cactus*, which has been produced under the surprisingly appropriate name of *Epiphyllum* cœruleum *grandiflorum!* Such practices are by no means confined to England; on the contrary, they are more numerous elsewhere than within our own shores. But come from where they will, they are discreditable to all concerned in their manufacture. We mention no persons for the present; we only point to the exhibition tables at Chiswick last Wednesday.

To turn to the real novelties there, it is impossible not to direct attention, in the first instance, to the very curious and singularly beautiful Princess Royal Rhododendron exhibited by Messrs. Veitch. This striking novelty was obtained from the white *R. jasminiflorum* by the palest variety of *R. javanicum*. In form it was intermediate between its parents, but its flowers were a clear pure rose colour. Along with it was a fine Californian plant, resembling Phlox setacea in flowers and leaves; but forming a stiff hard-wooded shrub. It was shown under the name of *Leptodactylon californicum*, which was a mistake. The plant appeared to be a Phlox, allied to *Phlox speciosa*. To the same group has to be added a Rhododendron from Borneo, apparently the same as the supposed variety of *R. Brookeanum* with red-edged leaves, to which allusion was made last week in our column of new plants; it was not in flower, so that nothing more can be said about it for the present. To these must be added a singular Dendrobium "from Amboyna," in the way of D. secundum, with purplish flowers tipped with green. Messrs. Rollisson are the possessors of this, which is quite an acquisition.

Other novelty there was none of much moment except a beautiful hybrid Achimenes, with most brilliant scarlet flowers, raised by Mr. Ingram at Frogmore, and a very fine deep rose-coloured *Petunia*, almost as handsome as a Dipladenia; this bore the name of the Marquise de la Ferté, and came from Mr. Westwood, of Acton.

The rest of the exhibition consisted of the usual tribes of plants, among which fine leaved plants were a new feature; and by surrounding such groups with a border of fancy Pelargoniums they were made highly effective. Variegated plants too are increasing in variety and becoming every year more attractive. We think that gardeners may congratulate themselves upon attention being thus directed to a new mode of decoration, which is sure to be found useful when flowers themselves are not procurable. As long ago as November 1st, 1845, we pointed out how wide a field there is among the variegation of leaves, and how numerous are the colours besides green which foliage presents; that the public has profited by the hint is shown by the fine examples of variegation now to be found at every metropolitan exhibition. Let us hope that growers will make yet another step in advance, and separate on the exhibition tables the hardy from the tender, or very delicate races.

For details we refer to the report given in another column.

The following account of a new kind of garden pot appears in the *Revue Horticole*. An English amateur, Mr. Keir, residing in Paris, has contrived a method by which the branches of trees can be more conveniently layered than heretofore. Pots with a slit on one side have been long in use; but difficulty has been found in their use out of doors, on account of the want of any good means of securing them in a fixed position or at any desired height. Mr. Keir proposes to make such pots with a tubular projection on one side (*a b*) through which a staff may pass, and, being driven into the ground, hold the pot perfectly steady.

The following cut explains at a glance the nature of the invention. In forming such a pot, it is said

that the potter must take care that the slit *c* is so small as just to allow the branch *d* to pass in without leaving room for the earth to slip out. But this precaution seems needless; for it would be easy to prevent the earth slipping by means of pebbles or crocks applied to the slit after the branch is inserted, and as the pot is being filled with earth.

The attempt to make up for the deficiencies in the funds allotted to botanical gardens by commercial arrangements, is seldom attended with much success; but undoubtedly the worst plan of all is the endeavour to obtain the services of a superior head gardener or curator at a low salary by allowing him to carry on a separate business as nurseryman on his own grounds, or to raise plants for sale on his own account in the garden itself. As the salary he receives from the garden is thus professedly insufficient to purchase his whole time and talents, he feels perfectly justified not only in devoting a portion of both to his private business, but also in diverting to the latter many of the means of procuring and preserving plants which should, strictly speaking, belong to the garden. He is indeed the sole judge of how far his resources should be distributed between the two, and he must be an extraordinarily scrupulous man who would not in cases of doubt prefer his own nursery. In one of those large continental establishments where the annual allowances are not always in proportion to the liberality of occasional outlays, we had occasion many years ago to admire the number, the beauty, and variety of specimens of rare and curious plants illustrating the flora of a particular country as obtained from a collection at considerable expense. Visiting the same garden but a few years later, this fine collection was reduced to a most ordinary one, the best specimens had disappeared—they had died from "the effects of the seasons, the want of proper accommodation," &c., and had not been replaced; but most of them had reappeared in the shape of young plants on sale at the head gardener's private nursery. This circumstance was well known and commented upon, yet there had been nothing in his conduct to justify the managers in making any charge of dishonesty.

A much more common practice is where the gardener propagates curious or ornamental plants for sale in order to help out the garden funds without having himself any direct personal interest in the produce of the sales. This may possibly answer in the case of subscription gardens, where the title of botanic garden with the outward show of science is intended rather as an evidence that the object of the subscribers is rational recreation without pecuniary profit, than as a pledge to afford efficient assistance to botanical instruction. In such gardens it is perfectly true that the means of propagation necessary for keeping up the ornamental beds and shrubberies may be with a trifling expense extended so as to have a few plants for sale. The subscribers may procure a few things at a low price, and there may possibly be a small apparent balance to bring to account beyond the extra expense. But this cannot be done to any important extent without interfering with the main object of the garden; the ordinary surplus plants will seldom be such as precisely to suit the demands of the public; a ready sale at remunerative prices cannot be ensured without entering into a regular nurseryman's business; this, it is well known, brings no profit, unless the head man devotes to it his whole energies, and, if he does that, what is to become of the society's ornamental or recreative botanic garden? A nursery garden may have its beauties if viewed as a nursery, but it cannot be made into a botanic garden or an ornamental promenade without a proportionate loss; unless indeed the scientific or ornamental part be considered as a means of attracting customers, and thus be wholly subservient to the commercial object in view. When once the commercial element is introduced, science and ornament become servants, not masters.

This is still more strongly exemplified in the case of University and public botanic gardens. In all cases where we have known the sale of plants introduced as an aid in support of these establishments, it has invariably been done to the detriment of the main collection—the end is more or less sacrificed for the means. It being decided that the garden cannot be maintained without the produce of sales, the first attention is bestowed on the propagating for this purpose; the main collection is little attended to except at spare times, till in some cases it comes to be little more thought of than as a stock to procure grafts or cuttings from. We believe it may be generally stated that there are few, if any, of these cases of combination, where, if the accounts were strictly and fairly kept, it would not be found that the commercial part of the undertaking is carried on at a bare compensation for the bonâ fide outlay, or even at a loss, and that seldom, if ever, is there any real surplus applicable in aid of the maintenance of the botanical collection. *G. B.*

New Plants.

132. Juniperus pyriformis.

J. foliis primariis patentibus ternatim verticillatis pungentibus glaucis, secundariis arctè adpressis imbricatis acutis, galbulis pyriformibus (obovatis) denique oblongis squamis apice liberis foliaceis demum reflexis.

A very distinct species, brought to Messrs. Veitch by Mr. W. Lobb from the mountains of S. Bernardino in California, where it forms a low tree 10—12 feet high. When young the leaves are whorled in threes, glaucous, spreading, and sharp pointed; on the old branches they become closely pressed, short, and so arranged as to form nearly terete twigs. The fruits are remarkable for being very like small Pears when young, but marked with the free spreading and rather leafy ends of the consolidated scales; when full grown these scales turn back and apply themselves closely to the surface. The berries are deep purple with a glaucous bloom.

Young plants of this are, we understand, in the possession of Messrs. Veitch. It may possibly be the same as Jeffrey's No. 1475.

133. Cupressus Macnabiana. *A. Murray, in Edinb. new Phil. Journal*, i., 293, *t.* 11.

C. foliis obtusis utrinque concavis farinosis carinâ et apice viridibus, strobilis globosis: squamis umbone obtuso elongato incurvo armatis.

Mr. Andrew Murray, who found this in California, in latitude about 41° N., describes it "as an evergreen shrub growing to no great size," with a gnarled and tortuous appearance; and this entirely corresponds with the dried specimen with which we have been favoured by that gentleman. In some respects it resembles *C. Uhdeana*, but is immediately distinguished by the leaves being deeply hollowed out on each side of the midrib, and being there coated with a glaucous matter resembling the bloom of a Plum, while the back and points remain bright green. This circumstance is

not very apparent in old and weather-beaten specimens, such as Mr. Murray brought home, but it forms a most striking feature in the plant as found by Mr. Lobb on the Sierra Nevada of N. California, where it was a bush from 6 to 10 feet high. The specimens (No. 439) gathered by Mr. W. Lobb, and from which Messrs. Veitch have raised young plants, presented a most striking appearance, with their green and glaucous scales associated with the deep rich brown of Tamarix gallica on their branches, and show that in youth and vigour the species must be exceedingly handsome. We had called the plant C. nivalis, under which it stands in Messrs. Veitch's list; but as that name has not been published, it must yield to that of *C. Macnabiana*, since given by Mr. Murray.

VEGETABLE PATHOLOGY.—No. LXXVII.

305*. Chlorosis (*Chlorosis of Onions*).—There are few crops which amongst a number of healthy plants do not present a few chlorotic individuals, distinguished by their unhealthy yellow tint. Onions are no exception to the general rule, and I have accordingly had no difficulty in finding such individuals, for comparison with the diseased plants now before me, after a search of one or two seconds. There are, indeed, varieties in which this yellow tint is normal, as in the case of the large yellow Leek of Rouen, but such instances, whether peculiar or not to the particular variety, are not the affection which I have in view in the present article, but one far more nearly allied to the Chlorosis of Hyacinths, and a very formidable malady. Whether it is generally diffused or not I am unable to say. The specimens under consideration were kindly forwarded by Mr. Donald Sinclair, of Campsall, and present a very remarkable condition. In the germination of the Onion, the cotyledonal leaf which appears above the ground in the form of a little loop produces from a fissure in its side the first and succeeding leaves of the plumule.* The base of this leaf either retains the form of a sheath, or bursts at the base, according to its powers of dilation, and the whole soon withers away. The base of the first leaf of the plumule generally remains entire, but it sometimes happens that it is ruptured on one side, and in such cases the Onion is seldom well formed and perfect, or becomes what is called by gardeners burst or thick-necked. In the diseased Onions before me, the base of the cotyledonal leaf is far more fleshy than usual, uniformly bursting on one side and remaining for a considerable period attached to the bulb. The sheath of the succeeding leaf is very short, much thickened, extremely wrinkled and distorted, in most cases entire but sometimes fissured, and the blade itself looks unhealthy with a more or less decided chlorotic tinge marbling the green. The succeeding leaf has something of the same aspect, but is still more wrinkled and fleshy, while those which follow have a decided yellow tinge, each new leaf being more and more affected. The leaves themselves, as well as the base, are often much distorted, striped and mottled with green and yellow, and the common vascular column from which the leaves spring at the base of the young bulb is discoloured, and evidently in a condition rapidly tending to decay. The disease is fatal to every purpose of the cultivator, for the plants are so deformed as to make them unfit for sale in a young state, and they give no hope of arriving at anything approaching to perfection, should they not perish at an early stage of growth. The most curious point is that for some years past the Onion crop has been constantly injured by the same affection in a particular garden near Doncaster. The soil is light, in a limestone district, manured with rotted stable dung, and presenting apparently nothing in its texture or aspect likely to be injurious to healthy growth, and yet the ground and seed have beenchanged every year with the same unfortunate result. Onions transplanted from other gardens succeed perfectly, and do not acquire the disease, which affects the plant therefore in its earliest stage only. That there is some local influence which is the effective agent cannot be doubted; what this may be can only be discovered upon the spot, if at all. An attentive examination of the plants from their earliest state of germination, and comparison with similar circumstances in neighbouring gardens can alone solve the difficulty, and it would be doing good service to horticulture, and a grand step in Vegetable Pathology, if the intelligent correspondent who has forwarded the specimens would examine the point attentively and report thereon when he has made out anything satisfactory with respect to the origin of the disease. It is evident that the plant in the first instance has an over supply of some principle which induces exuberant growth, producing distortion and unnatural thickening of the substance. This is succeeded by depressed vital energy probably in consequence of a reaction of the system. Both these stages require distinct study, and the first thing is if possible to detect whether there is any peculiar stimulating principle in the soil, which does not exist in neighbouring gardens, where the plant remains healthy. Portions of the same seed might be sown in different gardens, the plants themselves from the healthy and tainted soils might be analysed, and other methods might be taken likely to lead to something useful. If, however, it is reflected how little is known of the causes from which malignant fevers arise in the human frame, a failure cannot be discreditable, while on the other hand success may lead to the most important results; and we have seldom seen an opportunity which opens a fairer prospect. *M. J. B.*

* The growth of the cotyledonal leaf of the Onion is singular. As soon as the loop is once formed the increase of the two portions is perfectly distinct. If a spot of paint be placed at the highest point of the loop, where there is frequently a little tubercle, it remains perfectly stationary, however much the separate portions may grow. The portion attached to the seed increases at the extremity which is still retained in the albumen, at whose expense it lives, while the growth of the other half takes place by means of nutriment derived from the soil. The first root is never endorrhizal, and the same may be said of a great number of endogenous plants. In Grasses there are endorrhizal roots, but the representative of the true primary root is to be found, I believe, in the disc by which the embryo is attached to the albumen. If this view is correct the distinction of endorrhizal and exorrhizal cannot be maintained. I shall hope to present further details to the readers of this Journal on this subject as soon as all the monocotyledons which I have sown this year have germinated, or rather as soon as all hope ceases of any additional observations.

THE INFLUENCE OF HEAT ON THE PROGRESS OF VEGETATION.

[M. Boussingault in his "Economie Rurale," pointed out what he conceived to be the importance of ascertaining the mean temperature of the period of vegetation of different plants in different countries. To do this it is necessary to determine the time which elapses between the birth of a plant and its maturity, and then to determine the temperature of the period included between these two extremes of vegetable life. An examination of these points in M. Bossingault's point of view, has led to the conclusion that for Europe and America the length of time which elapses between birth and maturity is inversely as the temperature of the same period. The following observations on this subject by M. Gasparin further illustrate the subject.]

As soon as Réaumur had regulated the indications of the thermometer, he sought to discover some relation between the sum of temperatures and the duration of the vegetation of plants. Adanson and Cotte endeavoured to attain the same object, but they did not possess the means of arriving at any exact results. Since then M. Boussingault, in a memoir presented to the Academy of Sciences and in his "Economie Rurale," has published some approximations between the sums of temperature in different places and the period of maturity of several plants. We have ourselves endeavoured to extend these observations to plants cultivated in Europe, and also to take into account the effects of solar radiation. M. Quetelet was struck with some anomalous results, and proposed to use the sum of the squares of the degrees of temperature instead of the sum of those degrees themselves, and M. Babinet, proceeding from certain theoretical data, came to the conclusion that the sum of the degrees ought to be multiplied by the square of the number of days of duration of growth.

Such was the state of the question when we determined to examine it afresh. Our researches showed, in the first place, that all the means previously used for obtaining a comparison between the phases of vegetation and the temperature were open to objection; and, in the next place, we were induced to think we had ascertained the causes of the anomalies which had been observed and obtained a glimpse of what was still required to place the whole matter in a clear point of view. The present memoir relates to the researches above alluded to. The first part consists of an examination of the hypotheses which have already been advanced, and the second contains the views which are proposed to be substituted for them. The first part consists almost entirely of numerical tables, of which a short summary only is here given.

Part I.—In the tables laid before the Academy by M. Boussingault in 1837, and in those inserted in his "Economie Rurale," he has sought the sum of the temperatures observed from the time when the frost ceased, up to the time of the maturity of the plants. He supposes frost to cease in Paris on the 15th of February, and in the south of France on the 1st. His results are:—

In Alsace	2150 degrees.
At Paris	2160 "
" Kingston (New York)	2066 "
" Quiachaqui (equinoxial zone)... ...	2534 "

For reasons stated in the memoir we cannot for the present admit the number for Alais which is set down as 2121°. It will be observed from the above table that the three numbers which relate to places in the temperate zone are nearly the same, whilst there is a great difference between them and that for Quiachaqui, which is in the torrid zone.

In the same manner we have treated the observations made at Orange for a mean of 33 years (in particular those of the years 1853 and 1854), and also observations for five different years made in the district school of La Saussaie, near Lyons. All these sums for places in the valley of the Rhone gave a maximum of 1966°, a minimum of 1613°, and a mean of 1748°, different from that which was obtained in other meteorological basins. Lastly, at Lougan, in the country of the Don Cossacks, corn requires 2537° to enable it to arrive at maturity, which is the same as is requisite at Quiachaqui in the equatorial zone.

If now we turn to spring Barley we find the following numbers:—

Lyngen, in Norway, (70° of lat.)	1055 degs.
Nertschinsk, Siberia, (51° 18')	1482 "
Brussels	1765 "
Versailles (1852)	1549 "
Orange, mean	1500 "

All these anomalies show that, although the progress of vegetation is evidently influenced by the sum of the temperatures, it also depends on other causes, which render it incorrect to rely on the temperature alone when we wish to assign a normal uniform cycle which plants must pass through before they arrive at maturity.

It was whilst observing this want of harmony that M. Quetelet came to the conclusion that it was necessary to take into account not only the sum of degrees received, but also the manner in which they are received. Two days, each giving 10° of mean temperature, do not produce the same effect as one day of 20°. He was thus induced to consider the temperature as a *vis viva* of which the sum of the squares of the degrees ought to be taken instead of the sum of the degrees themselves. When, however, he came to apply his method to the flowering of Lilacs, reckoning from the time when the frosts ceased, the two sums gave, during several years, results which were identical, viz., 476° for the sum of the degrees, and 1296° for the sum of their squares. We have tried the same method for two different years in which the flowering of Lilacs was given by Catte. The place was Laon. In 1782, from the 22d February to the 3d April, we obtained 577° for the sum of the degrees and 4770° for the sum of their squares. In 1790, from the 22d January to the 10th April, the number of degrees was 477.7°, and that of their squares 3410. Here we have no trace of any agreement either between the two years or with what was observed at Brussels. Taking the Grape harvest at Orange we find, from the opening of the buds to the harvest, in

1844—3160 for the sum of degrees;	62462 for that of the squares.	
1847—3010 " "	67321 " "	

The method of squares gives an approximation which is even less close than that obtained by taking the sum of the degrees themselves.

Our learned colleague, M. Babinet, upon the ground that the effect of a constant mechanical force acting for a certain time is proportional to the intensity of the force, multiplied by the square of the time for which it acts, recommended a trial of the application of this principle to the subject in question. If we try it on the examples already cited, we find that the vegetation of the Lilacs up to the time of flowering lasted 81 days in 1782, that the mean temperature was $\frac{577}{81} = 7.12°$, which, multiplied by 6581, the square of 81, gives us 44856. In 1790 we find that the vegetation lasted 79 days, that the mean temperature was 6.06°, which multiplied by 6241, the square of 79, gives 37820. The dissimilarity in these results shows that this method is not satisfactory.

If, as we ourselves suggested, the solar radiation is added to the temperature of the air, the figures expressing the sums of the temperatures do not approach equality. Solar heat has an undoubted effect on vegetation, but its action is not entirely of the same nature as that of heat unaccompanied by light, and no good result is obtainable from the addition of two quantities of dissimilar nature. We thus see that it is necessary to have recourse to other principles to explain the progress or stoppage of the different phases of vegetation. The examination of those other principles will be found in the second part of this essay. *Comptes rendus.*

(*To be continued.*)

Home Correspondence.

How to clear Choked-up Pipes or Drains.—The village of Pompignan, a few miles north of Toulouse, France, is supplied with water from a spring in the high ground of the chateau, the water being conveyed through pipes. These pipes are frequently choked up with roots, or perhaps, as is there affirmed, by a water plant which vegetates without light; and to clear the pipes when so obstructed, a chain is drawn through them. Now, as drains are frequently choked in this country by roots, might it not be practicable to clear them by drawing a chain through them, as at Pompignan? Or rather might not some better mechanical means of freeing them be contrived? For instance, a kind of disc of metal nearly filling up the pipe or drain, and drawn through it by a chain, openings being left at convenient distances for the insertion of the disc and chain, and for the extraction of the roots. In a system of pipes for irrigation some such contrivance should be essential. *B.*

How to get rid of Cockroaches.—Permit me to say that I and many of my friends (who recommended it to me) have found "Emery's Beetle Poison" an effectual remedy. Two or three of the little balls are placed in the kitchen, &c. They are harmless to anything else. It can be had of any chemist in London. *H. M.*

Irrigation.—At a recent discussion at the Society of Arts respecting railroads and canals, the irrigation of the peninsula of India was a prominent feature, and the conveyance of water for that purpose in close channels was stated to be an improvement of a most important nature, could it be effected at a moderate cost. The desirability of covered channels was stated to arise from the immense evaporation that takes place in open ones, amounting, it was said, in Spain to a third part of the water distributed. If this be so, it results that the manner of applying water to the land is of great importance, since by spreading the fluid over an extensive space a considerable portion of the water must be lost by evaporation, and hence the jet, which was advocated by the chairman (Mr. Chadwick) seems unsuitable in hot climates especially; but his observation seems just that by irrigation a power is obtained of administering water at times when it is needful for the growth of plants, and of withholding it when prejudicial; indeed, all the gentlemen who took part in the discussion were unanimous in the opinion that by means of irrigation

the famines, now so frequent in India, would be prevented. Colonel Cotton advocated navigable canals for the conveyance of water; Mr. Bridges Adams was the chief supporter of railroads, and in his observations remarked that they did not preclude irrigation, but, on the contrary, would tend to the use of covered channels for the conveyance of water. On this subject it may be stated that meadows, and such close crops as Lucerne, can only be irrigated by aspersion or by flooding them. Mr. Chadwick has given a table of particulars showing that the first outlay for catch meadows, as well as the second expenses, both of them considerably exceed the cost of laying pipes, and the current expenses of irrigation by aspersion. If this be so, the conveyance of water by means of pipes is desirable in all countries, and on the score of evaporation it is especially eligible in hot climates. It remains, then, to consider what would be the best mode of constructing the pipes, in order that the smallest quantity of water might be most conducive to the growth of plants. In this view it must not be forgotten that although plants absorb moisture by their leaves, it is their roots that absorb the greatest quantity, consequently, in artificial irrigation, it is to the root that water should be administered. This is, in fact, the practice in the south of France, where water is in kitchen gardens conveyed in channels between beds of vegetables, it penetrates the soil, reaching the roots of the plants cultivated in the adjoining beds; but, according to common usage, this mode is costly, every channel being successively closed up with garden mould. Adopting this principle in combination with pipes, it may be conceived that irrigation might be effected with little waste of water in this country, though it would be particularly applicable in hotter climates, such as that of the peninsula of India. According to this project, it may be conceived that the land in cultivation should be laid out in beds of a convenient length, say 8 or 10 feet wide, that water channels should be formed between the beds, and that at the head of each set of beds a line of pipes should be placed, they having openings in them for the emission of water, those openings corresponding with the channels between the beds. The irrigating process would then be simply the opening of the pipe at its extremity for the admission of water, and the closing it again when a sufficiency was distributed. It is evident that some experimental pipes would be required to ascertain the size of the apertures; of course they would need to be the larger the farther they receded from the influx of the water. There is another circumstance in favour of this mode of irrigation, namely, that the soil is not hardened as when the fluid is administered by aspersion; in loose soils, such as sand, this is of little importance, but in all tenacious ground the exclusion of air from the roots of plants might counterbalance the benefit of watering them. If it has been proved that pipes are cheaper than open channels for the distribution of water, it follows that covered channels of large dimensions would be more economical in India than open cuts. Indeed, it is a well-known fact that up to considerable dimensions, the cost of large drains is much less than that of small ones if their comparative capacity be taken into account. *B.*

Societies.

Horticultural: Garden Exhibition, *June* 20.—The more prominent features of this brilliant midsummer display of fruits and flowers being adverted to in another column, renders it unnecessary here to do more than notice the scene in detail.

Of collections of 20 Stove and Greenhouse Plants, the best came from Mr. Dods, gr. to Sir J. Cathcart, Bart. It consisted of:—

Allamanda cathartica	Erica depressa
Aphelexis macrantha purpurea	Epacris miniata grandiflora
„ speciosissima	Gompholobium polymorphum
Azalea Gledstanesi	Leschenaultia formosa
„ lateritia	„ biloba
Boronia serrulata	Pimelea decussata
Chorozema varium	„ Hendersoni
Clerodendron Kæmpferi	Polygala cordifolia
Crowea saligna	Vinca alba
Erica Cavendishi	„ rosea

The Epacris mentioned above was a large plant, covered with flowers even thus late in the season; the variegated Azalea was also still in fine condition, and nothing in their way could possibly exceed the beauty of the Everlastings, which were literally globes of flowers, nearly 3 feet in diameter. It ought to be remarked that the whole of the plants in this group were very skilfully selected as to colour. The bright blue of Leschenaultia biloba, the yellow of the Cavendish Heath and Allamanda, the numberless rosy heads of the Pimelea, and the bright scarlet of the Clerodendron, together with the white flowers of the Vinca, all contrasted well with one another, and produced a striking and agreeable whole. The Gompholobium was supported on a few sticks in the form of a bush, a mode of management much more tasteful and graceful to the eye than the old way of training it "to a face" over a stiffly-made trellis.

Messrs. Fraser, of Lea Bridge Road, contributed the next best group. This contained—

Adenandra fragrans	Epacris miniata
Allamanda cathartica	Eriostemon buxifolium
Aphelexis spectabilis	Erica tricolor Wilsoni
„ purpurea grandiflora	„ „ elegans
Azalea magnifica	„ metulæflora bicolor
„ Prima Donna	Pimelea diosmæfolia
Boronia tetrandra	Phænocoma proliferum
Clerodendron Kæmpferi	Stephanotis floribunda
Dracophyllum gracile	Vinca ocellata
Epacris grandiflora	„ alba

The Cape Heath called Erica metulæflora bicolor in this group was a noble bush; but its flowers lacked richness of colour. We need scarcely say that when the latter is well brought out this is one of the handsomest of Heaths. E. tricolor elegans was a noble specimen of a beautiful variety, which was well furnished with foliage to the very pot. The Phænocoma was unusually well flowered, and when seen in this condition, and finely grown as this was, it is really a striking plant, but how seldom does it deserve that character. The Stephanotis was as usual much admired, and so was the Allamanda, though its fully expanded blossoms were but limited. The Boronia tetrandra was covered with white starry flowers, and the Azaleas were still in fine bloom.

Mr. Rhodes, gr. to J. Philpotts, Esq., sent the following:—

Aphelexis rupestris grandiflora	Eriostemon buxifolium
„ macrantha grandiflora	Ixora alba
„ spectabilis	Leschenaultia formosa
Boronia tetrandra	Pimelea decussata
Cyrtoceras reflexum	Rondeletia speciosa
Dracophyllum gracile	Sollya heterophylla
Epacris grandiflora	„ linearis
Erica ventricosa coruscans	Statice Holfordi
„ depressa	Tetratheca verticillata
„ Alberti	Vinca rosea

The Everlastings in this group were small, but well grown and flowered. The Erica Alberti was conspicuous for its buff blossoms, a colour uncommon among Heaths. The Box-leaved Eriostemon was a pyramid of clean looking cheerful white flowers, and the blossoms of the Cyrtoceras were remarkable for the peculiarity of their shape.

Stove and Greenhouse Plants in groups of 12 were numerous. Mr. Green, gr. to Sir E. Antrobus, Bart., sent:—

Allamanda cathartica	Epacris miniata grandiflora
Aphelexis macr. purpurea	Erica Cavendishi
Azalea variegata	Ixora coccinea
„ coronata	Leschenaultia formosa
Echites atropurpurea	Polygala Dalmaisiana
	Rondeletia speciosa

The variegated Azalea was still in admirable condition, and was certainly the gem of the group. The Allamanda was only in flower at the top; but being luxuriant and healthy the plant had a clean refreshing appearance; this, indeed, was the distinguishing characteristic of the whole of the plants in the collection. The Everlasting and Polygala were both very fine. It is seldom that we have seen Polygalas generally look better than they did on this occasion.

Mr. Carson, gr. to W. F. G. Farmer, Esq., sent:—

Allamanda cathartica	Franciscea latifolia
Aphelexis macr. purpurea	Leschenaultia biloba
Clerodendron splendens	Pimelea spectabilis
Dipladenia crassinoda	Polygala acuminata
Echites atropurpurea	„ oppositifolia
Erica Cavendishi	„ cordifolia

The Dipladenia was in beautiful condition, and its flowers were higher coloured than usual. The Pimelea was a well-shaped bush with a fine head of flowers. The Polygalas were large and showy, and the Allamanda was a fine specimen of its class. The dark chocolate-coloured Echites atro-purpurea was trained "to a face" over a round wire trellis. The Aphelexis was quite a mass of flowers.

Mr. Roser, gr. to J. Bradbury, Esq., produced—

Adenandra fragrans	Chorozema varium
Aphelexis speciosissima	Erica ventricosa coccinea
„ macrantha purpurea	Epacris miniata
„ grandiflora	Mitraria coccinea
Azalea exquisita	Polygala Dalmaisiana
Boronia serrulata	Pimelea Hendersoni

In this group perhaps the most striking plant was the Epacris, but the Everlastings were also finely in flower.

Mr. Cutbush, of Barnet, contributed:—

Aphelexis macrantha	Leschenaultia formosa
„ rupestris grandiflora	Phænocoma proliferum
Boronia serrulata	Pimelea decussata
Dipladenia crassinoda	„ Hendersoni
Erica Cavendishi	Polygala acuminata
„ ventricosa magnifica	Statice Holfordi

The best plants in this group were the Dipladenia, the Cavendish Heath, the Statice, and the Everlastings.

Collections of Six Plants came from Mr. Dods, gr. to Sir J. Cathcart, Bart.; Mr. Morris, gr. to Coles Child, Esq.; Mr. Taylor, gr. to J. Coster, Esq.; and Messrs. Pamplin, of Lea Bridge Road. The plants in the first group were quite models of cultivation—not large, but perfect in every respect. They were Erica tricolor Wilsoni and depressa, Leschenaultia formosa, Polygala Dalmaisiana, Pimelea spectabilis, and Aphelexis humilis rosea. The latter is a great improvement on humilis, its large rosy flower with yellow centres being extremely showy. The Pimelea was also very fine. Mr. Morris sent Epacris miniata, Kalosanthes versicolor, Allamanda neriifolia, Aphelexis macrantha purpurea, Euphorbia splendens, and Vinca alba. Mr. Taylor had Dipladenia crassinoda, Leschenaultia formosa, Azalea Minerva, a glowing purple kind; Boronia serrulata, Aphelexis spectabilis grandiflora, and Erica perspicua. Messrs. Pamplin produced Epacris miniata, Erica tricolor Wilsoni, one of the best of its class, Stephanotis floribunda, Epiphyllum speciosum, Aphelexis macrantha purpurea, and Pimelea hispida.

Of Variegated Plants there were collections from Messrs. Veitch, Rollisson, and Henderson. In the first group were various Anæctochiles, a variegated variety of the Aloe-leaved Yucca, Maranta Warsewiczi and albo-lineata, Coleus Blumei, a variegated Hydrangea japonica, Crotons of different kinds, Dracæna terminalis, the beautiful Cissus discolor, Begonia Thwaitesi, various Caladiums, a variegated variety of Aspidistra lurida, Vriesia speciosa, and a variegated Screw Pine. Messrs. Rollisson sent Caladiums, Crotons, the Java Lady's Slipper; a spotted variety of the Siebold Dracæna, Ananassa sativa variegata, Pandanus javanicus variegatus, Cissus discolor, Marantas, Coleus, Stenorhynchus maculatus, and Canna discolor. Among Messrs. Henderson's plants, which were for the most part small, were the beautiful white-veined Aphelandra Leopoldi, Tillandsia splendens, Screw Pines, Dracænas, Cissus, Duranta variegata and Coleus Blumei.

Groups of plants remarkable for fine foliage came from Messrs. Veitch and Rollisson. The first collection consisted chiefly of Palms intermixed with such plants as Philodendron pertusum, the Dragon tree (Dracæna Draco), &c. The most remarkable plants in Messrs. Rollisson's group were Rhopala corcovadensis, a very fine specimen; Nepenthes Rafflesiana and albo-marginata, Aralias, and Araucaria excelsa glauca.

Everlastings were exhibited by Messrs. Rollisson, who produced Aphelexis macrantha purpurea, rosea, humilis, spectabilis, sesamoides, and speciosissima.

Orchids were extremely brilliant, the various collections exhibited being numerous, fresh, and well varied. In groups of 20 plants Mr. Williams, gr. to C. B. Warner, Esq., contributed—

Aerides affine	Cattleya superba
„ Larpentæ	Cypripedium barbatum
„ maculosum	Lycaste Skinneri
„ maculosum superbum	Odontoglossum citrosmum
„ crispum	„ læve
„ odoratum purpurascens	Saccolabium guttatum superbum
„ odoratum majus	„ guttatum
„ roseum	„ præmorsum
Calanthe veratrifolia	Vanda teres
Cattleya Mossiæ	„ suavis

These wholly consisted of clean looking well-flowered plants, which were neatly arranged as to colours. The Sweet Vanda had two noble spikes of flowers on it. The variety of Aerides odoratum called purpurascens was quite 3 feet in height and clothed with flower spikes and healthy foliage down to the very pot. The Saccolabiums had four and five spikes each. Cattleya superba was a beautiful plant of a fine kind; altogether this was one of the best collections that has been staged this year; its only fault was it had too many Aerides in it.

Mr. Woolley, gr. to H. B. Ker, Esq., had:—

Aerides affine	Epidendrum crassifolium
„ odoratum majus	„ rhizophorum
„ roseum	Lycaste aromatica
Barkeria spectabilis	Lælia cinnabarina
Cattleya Mossiæ	Oncidium flexuosum
Calanthe veratrifolia	„ leucochilum
Cypripedium barbatum	Saccolabium præmorsum
Dendrobium Devonianum	„ guttatum
„ formosum	Sobralia macrantha
„ moschatum	Vanda Roxburghi cerulea

The brilliant orange scarlet blossoms of Epidendrum rhizophorum and Lælia cinnabarina constituted the most remarkable feature of this group. The two Saccolabiums were however well-flowered, good-looking plants; and the Barkeria, on a wooden platform fastened on the top of a pot, was extremely well flowered and really very beautiful.

Messrs. Veitch had well-flowered plants of the following:—

Aerides affine	Dendrobium nobile
„ Larpentæ	Oncidium pulvinatum
„ odoratum	Phalænopsis grandiflora
„ "Fox brush"	Saccolabium guttatum
Cattleya Mossiæ	„ præmorsum
„ citrina	Sobralia macrantha
Cœlogyne Lowi	Vanda insignis
Cypripedium barbatum	„ teres
Dendrobium Dalhousieanum	„ tricolor
„ formosum	

The Cattleya citrina in this group had four expanded flowers on it, remarkable for their bright yellow colour—a rarity in this genus. The Sobralia was a noble plant, covered with large purple blossoms. The Saccolabiums were also charming specimens, whose long drooping racemes, thickly set with handsome flowers, were much admired.

Messrs. Rollisson also exhibited a collection of 20 plants, which consisted of:—

Aerides odoratum	Dendrobium Calceolaria
„ affine	„ moschatum
„ affine roseum	Odontoglossum hastilabium
„ crispum	Phalænopsis amabilis
„ Larpentæ	„ grandiflora
Brassia brachiata	Stanhopea oculata
Cattleya Aclandæ	Saccolabium guttatum
„ Leopoldi	Sobralia Galeottiana
„ Mossiæ	„ macrantha
Cypripedium barbatum.	Uropedium Lindeni

The green, brown-barred sepals and petals of the Leopold and Acland Cattleyas, together with their bright purple lips, rendered them objects of especial remark. The more striking plants in this group, however, were the large Sobralias; that named Galeottiana appeared to be merely a pale variety of macrantha. The Stanhopea was well flowered, and so were most of the other plants, the least conspicuous among which was perhaps, the green Brassia brachiata.

Of Orchids in tens there were three collections. Mr. Gedney, gr. to Mrs. Ellis, of Hoddesdon, produced

Aerides affine	Calanthe masuca
„ roseum	Oncidium pulvinatum
„ odoratum	Phalænopsis grandiflora
„ „ purpurascens	Saccolabium guttatum
Cattleya Mossiæ	„ præmorsum

The "queen" of this exhibition was decidedly the White Butterfly plant (Phalænopsis), which was literally a mass of glorious white blossoms. The Saccolabiums were also beautiful, as was the Oncidium pulvinatum, the colour of whose flowers was extremely well brought out. Mr. Clarke, of Hoddesdon, communicated—

Aerides affine	Cattleya Mossiæ
„ „ rubrum	Oncidium luridum
„ roseum	Phalænopsis grandiflora
„ odoratum	Saccolabium præmorsum
„ „ purpurascens	Vanda teres

The different kinds of Aerides in this group were all good. What was called the red variety of affine had however, in this instance, no more colour in it than the species. The Phalænopsis was a fine plant, and so was Oncidium luridum, although somewhat dull in colour.

A third group from Mr. Carson, gr. to W. F. G. Farmer, Esq., contained—

Aerides odoratum	Dendrobium nobile
Angræcum caudatum	Epidendrum crassifolium
Cattleya intermedia	" longipetalum
Cypripedium barbatum	Phalænopsis grandiflora
Dendrobium moschatum	Saccolabium guttatum

The Lady's Slipper (Cypripedium) mentioned above was quite a mass of flowers, which were of a deeper rich brown than usual. The Cattleya intermedia was the colourless lipped variety, which is not near so handsome as the purple kind. The brown and yellow Epidendrum longipetalum is a distinct singular-looking species, which is certainly not unornamental.

Collections of 6 Orchids came from Mr. Ivison, gr. to the Duke of Northumberland at Syon; Mr. Keel, gr. to J. Butler, Esq.; Mr. Dods, gr. to Sir J. Cathcart, Bart.; Mr. Gedney, gr. to Mrs. Ellis; and Mr. Green, gr. to Sir E. Antrobus, Bart. In the group from Syon we remarked a variety of Cattleya Mossiæ with blossoms of immense size, and extremely handsome; the sepals and petals were nearly white, while the lip was brilliant purple stained with bright orange yellow in the throat. This is certainly a very fine kind. The best of the other sorts in these groups were Saccolabium guttatum, Oncidium ampliatum majus, O. roseum, Epidendrum macrochilum, Aerides odoratum, Dendrobium nobile, D. aggregatum, Calanthe veratrifolia, Brassia maculata, Anguloa Ruckeri, and Phaius Wallichi.

Specimen Orchids consisted of a very fine Phalænopsis grandiflora from Mr. Gedney, Aerides odoratum from Mr. Ivison, Oncidium flexuosum from Mr. Morris, Aerides affine from Messrs. Veitch, and an Oncid from Mr. Dunsford, of Chingford.

Cape Heaths were numerous and well flowered. They were furnished by Messrs. Rollisson; Mr. Roser, gr. to J. Bradbury, Esq.; Messrs. Fraser; Mr. Taylor, gr. to J. Coster, Esq.; Mr. Rhodes, gr. to J. Philpotts, Esq.; and Messrs. Pamplin. In these collections were some excellent plants of Cavendishi, the various varieties of tricolor, Westphalingia, the different kinds of ventricosa, mutabilis, metulæflora, and Bergiana. Mr. Glendinning showed a seedling called Spenceriana, which promises to be useful, being somewhat different in colour from sorts now commonly cultivated.

As single specimens, Mr. Roser showed Erica Massoni, a large plant, but not finely in flower; Mr. Taylor, E. tricolor Wilsoni; Mr. Green, Cavendishi; Mr. Carson, E. depressa, and Messrs. Rollisson the last-named variety.

Of other single specimens, Mr. Dods, gr. to Sir J. Cathcart, Bart., had Nepenthes distillatoria, not less than 10 feet in height, and loaded with pitchers; Messrs. Rollisson, the same potful of Cephalotus follicularis which has been shown so often already this season; Messrs. Veitch, Medinilla magnifica, and Mr. Taylor an Everlasting.

Roses in pots were good, although not so fine as they were in May. Exhibitions of them were furnished by Messrs. Lane, Paul, Francis, A. Rowland, Esq., Mr. Terry, gr. to Lady Puller; Mr. Sage, gr. to W. R. Robinson, Esq., of Acton. In these groups we remarked Queen, Paul Perras, Chénédolé, Adam, Vicomtesse Decazes, Juno, Great Western, Souvenir de Malmaison, Paul Ricaut, Baronne Prevost, Coup de Hebé, Blairi No. 2, Emperor Probus, Madam Willmorz—a comparatively new creamy coloured kind, Brennus, William Jesse, La Dauphine, Auguste Mie, and Souvenir d'un Ami. Nearly all of these, it will be seen, are well known kinds, which however it would be difficult to surpass in beauty or excellence.

New Plants in flower consisted of the so-called Leptodactylon californicum, a shrubby Phlox adverted to in another column, and a Hydrangea in the way of japonica, from Messrs. Veitch; a Dendrobium, from Amboyna, belonging to the secundum class, and Cypripedium barbatum (?), from Messrs. Rollisson; a charming potful of Linum grandiflorum from Messrs. Henderson, of Pine-apple Place; and Scheeria Mexicana, from Mr. Glendinning, of the Chiswick Nursery.

Among New Plants not in flower, the most remarkable were Begonia splendida, a kind with stems and leaves covered all over with brilliant red hairs, from Messrs. Rollisson; a variety of Rhododendron Brookeanum with red edged leaves, a Peruvian Begonia, and a Bornean Nepenthes, with deep green pitchers, from Messrs. Veitch. The last named firm also furnished the Rice-paper plant, Anæctochilus Veitchi, and Sonerila margaritacea. Messrs. Henderson sent a Gordonia from China, with large, rather handsome, deep green foliage.

Of New Garden Hybrids by far the most important was Messrs. Veitch's Rhododendron, Princess Royal, described in another column. Mr. Ingram, gr. to her Majesty at Frogmore, had a seedling Achimenes in the way of picta; but much more brilliant. Messrs. Rollisson sent a Gloxinia like Fyfeana in habit, called alba auriculata, a white kind with a ring of crimson in the inside of the throat; and Messrs. Henderson had Princess of Prussia, also an upright kind, and white with a crimson throat. These will, doubtless, both be favourites, as will also Messrs. Veitch's Comte de Tallyrand. Mr. Westwood had a Petunia, which is mentioned elsewhere, and we noticed a handsome scarlet Cactus, called Epiphyllum cæruleum grandiflorum.

Among Miscellaneous articles were some beautiful Ferns and Lycopods from Mr. Williams, gr. to C. B. Warner, Esq., a light-coloured Rhododendron called Duc de Brabant from Messrs. Rollisson, and cut blooms of Rhododendrons from Messrs. Jackson and Lane. Mr. Salter had cut flowers of Irises.

Florist Flowers were for the most part confined to Pelargoniums, which were present in considerable numbers, and in very good bloom, particularly the collections from Slough and Clewer. The class of 12 plants for private growers brought three competitors. Mr. Nye, gr. to E. Foster, Esq., produced 12 finely grown specimens, principally new and choice kinds, the flowers on which were large and well coloured. Phaeton and Attraction were particularly good. The others were Enchantress, Seraskier, Rosa (Foster), Carlos, Purple Perfection, Magnet, Pandora, Iris, Ariel, and Optimum. Mr. Holder, gr. to the Rev. E. Coleridge, sent large plants in good condition of the following varieties, viz.: Topsy, Ariadne, Enchantress, Magnet, Beatrice, Narcissus, Sanspareil, Mochanna, Mary, Portia, Carlos, and Virgin Queen. Mr. Maher, gr. to J. Strachan, Esq., sent the third collection, the varieties in which and not in the above, were Pearl, Leonora, Painter improved, Conspicuum, Centurion, Alderman, Napoleon, Spot, Village Maid, and Star. The class of 6 plants brought but two collections: Mr. Nye being first with Phæton, Purple Perfection, Rose (Foster), Optimum, Fair Ellen, and Enchantress. Mr. Robinson, Pimlico, had 6 large finely grown specimens, but they were not in such good bloom as those in other groups. In the Nurserymen's Class of 12 plants, there were four competitors: Mr. Turner, of Slough, exhibited large finely bloomed plants, the names of which were Beatrice, a noble specimen; Topsey, Astrea, Sanspareil, Enchantress, Medora, Virgin Queen, Painter improved, Portia, Governor General, Mary, and Rowena. Messrs. Dobson & Son, of Isleworth, sent Star, Vulcan, Magnet, Gertrude, Delicatum, Magnificent, Painter improved, Eugene, Ambassador, Rosamond, Conqueror, and Enchantress. Messrs. Fraser, of Lea Bridge Road, sent 12 small but compact well grown plants, which were, however, scarcely in bloom. They were Lucy, Majestic, Vandyck, and other good old varieties. Mr. Gaines, of Battersea, also had a collection of fancy kinds. There were seven groups of 6 plants, four from nurserymen and three from amateurs. By far the best was sent by Mr. Turner, who had a noble plant of Lady H. Campbell, Cassandra, Perfection, Charles Dickens, Conspicuum, and Criterion. Messrs. Fraser sent Miss Sheppard, Caliban, Advancer, Reine des Français, Celestial, and Empress. Mr. Gaines' collection consisted of Vandyck, Delicatum, Perfection, Conspicuum, Lucy, and Caractacus. Messrs. Dobson & Son had Erubescens, Celestial, Perfection, Criterion, Reine des Fleurs, and Chamouni. In the class of 6 plants for Amateurs Mr. Wier, gr. to — Hodgson, Esq., Hampstead, sent Fairy Queen, Jenny Lind, Hero of Surrey, Princess Alice, Fanny, and Formosissimum. Mr. Windsor was second with Madame Sontag, Fairy Queen, Bride, Celestial, Erubescens, and Lady H. Campbell. The next came from Mr. J. Robinson, who had nicely bloomed but rather small plants of kinds similar to the above.

There were six plants of an exceedingly showy seedling Fancy Pelargonium, sent by Mr. Turner, named Queen of Roses. This will make a fine exhibition plant. Mr. Dennis sent several examples of his seedling called Alma, a bright but badly formed variety for forcing, for which it appeared well adapted. Quite as showy a one of this class, named Sir E. Lyons, came from Mr. Bullen, of Dulwich. Mr. Gaines had scarlet Unique.

There was but one collection each of Calceolarias and Pansies, the former from Mr. Gaines, the latter from Messrs. Dobson and Son. Neither was so good as we have seen them.

The exhibition of Fruit was considerable for the season, and in most respects excellent. The only exception was the Pine-apples, which, as a whole, were inferior.

The best collection of Fruit was furnished by Mr. M'Ewen, gr. to the Duke of Norfolk, at Arundel. It contained a Providence Pine-apple, Black Hamburgh Grapes, very fine Royal George Peaches, Violette Hative Nectarines, Golden Perfection Melon, and Myatt's Cinquefolia Strawberries, a large showy variety. Mr. Fleming, gr. to the Duke of Sutherland, at Trentham, also had a collection in which were admirable bunches of Black Hamburgh Grapes, a Providence Pine, Royal George Peaches, Black Tartarian Cherries, Brown Ischia Figs, and a Trentham hybrid Melon.

Of Pine-Apples Mr. Robinson, gr. to Lord Boston, sent a Providence weighing 7 lbs. 4 oz.; Mr. Chapman, gr. to J. B. Glegg, Esq., a fruit of the same variety, weighing 6 lbs. 14 oz.; Mr. Barron, gr. to Mrs. Vivian, an Otaheite, weighing 4 lbs. 8 oz; Mr. Turnbull, gr. to the Duke of Marlborough, a Cayenne, weighing 4 lbs. 9 oz.; Mr. James, gr. to C. H. Leigh, Esq., a Queen, weighing 3 lbs. 10½ oz.; and Mr. Clements, of Oak Hill, a Queen, which weighed 2 lbs. 14 oz.

Grapes were plentiful and good, more especially black sorts; the white kinds were scarcely ripe. Mr. Fleming, gr. to the Duke of Sutherland, at Cliveden, had most excellent Black Hamburgh, large both in bunch and berry, and well coloured. Mr. Ingram, gr. to her Majesty at Frogmore, also had good Black Hamburgh; and so had Mr. Dods, gr. to Sir J. Cathcart, Bart. Mr. Martin, gr. to Sir P. H. Fleetwood, Bart., sent some extremely good examples of Black Frontignan, large both in bunch and berry, and quite black. Mr. Sharland, gr. to T. Farmer, Esq., produced fair specimens of Black Hamburgh, as did also Mr. Clarke, of Hoddesdon. The finest Muscat Grapes came from Mr. Turnbull, gr. to the Duke of Marlborough, at Blenheim; and Mr. Clements also had good Muscats; but they were too green to be taken notice of by the judges. Mr. Ingram, gr. to her Majesty at Frogmore, also sent good Muscats. Mr. Williams, gr. to C. B. Warner, Esq., Mr. Ayres, gr. to Lord Southampton, and Mr. Forsyth, gr. to Baron Rothschild, contributed good Muscadines. Other Grapes were less remarkable.

Grapes in pots, admirable specimens set up in the form of arches, were furnished by Mr. Forsyth, gr. to Baron Rothschild. These are alluded to in another page. Mr. Fleming, gr. to the Duke of Sutherland at Cliveden, also had very good Grapes in pots. The sorts were Black Hamburgh and Muscat; the latter were, however, unripe.

Of Peaches and Nectarines, excellent fruit, large, and well ripened, came from Mr. James, gr. to C. H. Leigh, Esq. The varieties were stated to be Royal George Peaches, and Violette Hative, and Red Roman Nectarines. Mr. Clement's Peaches were called White Magdalen and Noblesse, and Mr. Tegg, gr. to A. Prior, Esq., sent Grosse Mignonne Peaches and Violette Hative Nectarines. Elruge Nectarines, fine specimens, came from Mr. Eyles, gr. to Sir E. Kerrison, Bart., Mr. Ayres, gr. to Lord Southampton, and Mr. Chapman, gr. to J. B. Glegg, Esq. Some good Nectarines also came from Mr. Ingram, and Mr. Hill, gr. to R. Sneyd, Esq.

Melons.—The best was a Hybrid Cashmere, from Mr. Fleming, gr. to the Duke of Sutherland, at Trentham. Mr. Chapman sent a good green-fleshed; Mr. Salter, gr. to J. M. Yeels, Esq., had Victory of Bath; Mr. M'Ewen, a scarlet-fleshed called Prince Albert, and several other sorts; from Mr. Gardiner, gr. to Sir G. Phillips, Bart., came a hybrid green-fleshed; and varieties of the same fruit were also furnished by other growers.

Figs.—Mr. Ivison, gr. to the Duke of Northumberland at Syon, had good fruit of Brown Ischia; Mr. Fleming, of Trentham, the same variety; and Mr. Drummond, gr. to S. L. Stephens, Esq., Violette, a small Fig, but sweet, and well adapted for pot culture.

Of Cherries, Mr. Ingram, gr. to Her Majesty at Frogmore, sent fine dishes of Black Circassian Bigarreau, and May Duke; and Mr. Fleming, of Trentham, produced Knight's Early Black, Black Tartarian, and May Duke; Mr. Shuter, gr. to the Earl of Wilton, sent May Duke; as did also Mr. Martin, Mr. Ferguson, of Stowe, and Mr. M'Ewen.

Raspberries came from Mr. Fleming, of Trentham, and Mr. M'Ewen. The sorts were the Red Antwerp and Rivers's Double Bearing.

Of Strawberries, Mr. Smith, of Twickenham, sent magnificent dishes of British Queen, Sir Charles Napier, and Keens' Seedling. Mr. M'Ewen furnished from Arundel British Queen, Trollop's Victoria, and Keens' Seedling. British Queens, from Mr. Ingram, of Frogmore, were fine fruit, but scarcely sufficiently well coloured. Mr. Ingram, gr. to J. J. Blandy, Esq., had Keens' Seedling; Mr. Dunsford, British Queen; and Mr. Lydeard, of Bath, Trollop's Victoria; Mr. Turnbull sent Keens' Seedling. The only dish from the open ground was one of Keens' Seedlings, furnished by Mr. Roke, from Chertsey. Mr. Smith, of Twickenham, had some Strawberries in pots loaded with fruit. The sort was Sir C. Napier.

Among Miscellaneous Fruits were very fine Orleans Plums from Mr. Ingram, gr. to her Majesty at Frogmore, and Mr. Williams, gr. to C. B. Warner, Esq., sent dishes of Oranges, Lemons, and Citrons, which we have noticed at previous exhibitions.

Notices of Books.

A seventh edition of *Hooker and Arnott's British Flora* (Longmans, 14s.) has just appeared. It seems to have been carefully revised by the learned authors, and will be found an excellent field companion. We rejoice to find here, as elsewhere in so many places, fresh recruits for the new crusade against bad species; and we hope to see, when the next edition appears, that the genera Salix, Rubus, Rosa, &c., will be finally dealt with as they require. Sir William Hooker in his "Flora Scotica," and Professor Lindley in his "Monograph of Roses," began well; but we cannot say conscientiously that either has been true to his principles. The time, however, has evidently arrived when a determined stand must be made against spurious science, and we trust that no more time will be lost in drawing a clear distinction between botanists and botanophilists.

Piper's Popular Military and Naval Dictionary (12mo, Simpkin & Marshall, 1s. 6d.), is a little volume explaining the meaning of the military and naval terms now brought by the war into common use. It is well done, and answers the purpose for which it is intended.

Messrs. Stanford, Charing Cross, have published a very useful map of the Sea of Azoff, compiled from authentic documents. On a former occasion we had to notice a map of similar excellence of the works of the Allies round Sebastopol. This has a more extended sphere, is of more permanent interest, and is in all respects as well executed.

Garden Memoranda.

Mr. John Waterer's American Nursery, Bagshot.—Those who wish to see American plants in all the grandeur which they can present, and under the very best of circumstances, should now pay a visit to the fields of Rhododendrons, Azaleas, and Kalmias which have been planted and established here many years ago by Mr. Waterer. Every year about this time, or in forward seasons a little earlier, whole acres are studded with the lovely blossoms of these charming plants; and notwithstanding the very unfavourable winter and spring that have just passed by, they are as fine at the present time as ever we remember to have seen them. It is true that some of the deep crimson kinds are now over, and that a few of the tenderer scarlets lost their buds by the late spring frost, but this is a circumstance the less to be regretted; for by continually crossing the early kinds with late sorts we can now enjoy the beauty of scarlet or at least deep crimson Rhododendrons which flower sufficiently late to be out of the reach of such a calamity. We noticed standard Rhododendrons here 8 and 10 feet in height, with clean stems and immense heads loaded with flowers. Trees of these dimensions are not uncommon, and a knowledge of this fact alone, independent of the thousands of bushes and standards of less size, will serve to furnish lovers of American plants with some idea of the kind of treat a visit to Mr. Waterer's nursery may be expected to afford. The scarlet, orange, and buff colours of the Azaleas, too, form an interesting intermixture which renders the whole varied and effective. The broad-leaved Kalmias, too, promise soon to make an excellent display.

Among Rhododendrons, one of the best of the rich crimson kinds is Brayanum, a charming sort, with a good shaped truss; this should be in every collection. Barclayanum is also fine, and a late bloomer; atrosanguineum is very dark, and Archimedes is one of the very best of bright rose colours; Brutus is desirable and so is Desdemona; Nero and Onsloweanum are two valuable kinds, as are also maculatum nigrum and rubrum, the former having exchanged the spots that are usually on the upper petals for a blotch of deep chocolate, which gives it a distinct and striking appearance. Among other Rhododendrons few are more striking than Grand Arab, Soleil d'Austerlitz, Blandyanum, and vestitum coccineum. These are bright and beautiful varieties, and in most seasons flower sufficiently late to be out of the reach of spring frosts. Leopardi is a very fine spotted rosy lilac kind; and Towardianum has large, very finely shaped blossoms which must ever render it a favourite. Captivation is worth attention, on account of its compact, neat, conical heads; Blatteum is a very dark kind, with large trusses; and Nobleanum bicolor is good, as is also Mammoth. Lady Eleanor Cathcart is one of the most beautiful kinds we have seen, it has flowers not unlike those of a rosy pink Pelargonium, with a dark blotch on the upper petals; this has deservedly already become a favourite. John Waterer and Mrs. John Waterer are also very fine varieties; the colour of the former is nearly as bright as that of the Géant des Batailles Rose when about half blown; the latter is a charming rosy crimson. Catawbiense splendens and grandiflorum make excellent standards; C. album elegans and delicatissimum are still the best whites. Egregium makes a pretty standard, as do also mirandum, perspicuum, roseum elegans, and gemmiferum; the latter is a small rosy flowered kind. There is also grown here what is reported to be an excellent variety of Victoria, but this we did not see; Everestianum is still a most useful kind; Magniflorum is a brilliant rose, as are also Duchess of Wurtemberg, Sir Colin Campbell, and Reideanum. Piombo is a good spotted lilac. Fastuosum is a well-known double kind, which still maintains its good character.

Of Azaleas, one of the best scarlets is coccinea major, but cruenta is also a good one; aurantiaca cuprea is a fine orange, and carnea delicatissima a pretty light pink, and a good trusser; decus hortorum is rose, with the back petals yellow; and of buffs and yellows none surpassed pontica globosa, and p. princeps. Of other fine kinds of various colours, we remarked Gloria Patriæ, and Mundi, triumphans, imperatrix, monstrosa, Variabilis, Morteri, Ne Plus Ultra, persoluta, prænitens, crocea, distincta and nitens. These are all first rate kinds, in which no one need fear being disappointed. We also noticed in bloom a bed of the White Indian Azalea, which has stood the winter here unhurt.

At the entrance of this nursery next the town of Bagshot stands a very fine weeping Beech, which is exceedingly pendulous and handsome. Purple and copper Beeches are also common here. Among Conifers, which thrive well on the sandy peaty soil of this neighbourhood, were some remarkably fine young Deodars, which being moved frequently transplant with good roots. Of Pinus insignis there was a plentiful crop of seedlings; we also remarked P. Benthamiana, tuberculata, and Lambertiana. The Fitzroya and Saxe-Gothæa have wintered unhurt, while in some places we noticed the leaves of Araucaria imbricata browned. Indoors were young plants of Pinus Jeffreyana, Libocedrus decurrens, and Wellingtonia gigantea.

The fine Arbor-vitæ hedges with which this nursery is intersected deserve a concluding remark; they are some 10 feet in height, about 18 inches in width, and as perpendicular and even as they can be cut. They thus make close fences from bottom to top, and are not only useful but ornamental.

Calendar of Operations.

(For the ensuing week.)

PLANT DEPARTMENT.

Conservatory, &c.—The utmost care should be exercised to prolong the beauty of handsome specimens, carefully shading them on bright days and keeping the atmosphere as moist as circumstances will permit, and well supplying the plants with water at the root. It is particularly important to attend to shading and keeping the atmosphere moist while New Holland and other hardwooded plants are the principal ornaments of the house, for these soon fade in a warm dry atmosphere. Also give the most scrupulous attention to keeping everything about the show-house clean and neat, and keep a sharp watch upon specimens growing in the beds liable to the attacks of red spider, or other insects, and apply the proper remedy immediately the enemy is perceived.

FORCING DEPARTMENT.

Pineries.—Where the bottom heat is obtained from tan or other fermenting matter it will be necessary to add a little fresh material at intervals, in order to recruit the heat, but at this season it will be safer to surface with a few inches of fresh tan in a rather dry state than to turn the bed, mixing the fresh materials, which often cause too strong a heat; and at this season there is much more danger of erring on the side of too much than too little bottom heat. Give every attention to keeping up a succession of fruit. Perhaps the most certain method of doing this is by securing and potting a number of suckers proportionate to the demand, at short intervals during the growing season, therefore attend to keeping up a regular supply of young plants, if doing this should necessitate throwing away a few overgrown plants which have failed to fruit at the desired time. We have frequently seen gardeners allow the number of large plants to increase, so that there was little room left for the young stock, which suffered accordingly, and disappointment came in due course. Do not let the growing stock suffer for want of pot room, or through dryness at the root, and afford them a moist atmosphere, syringing and shutting up early in the afternoon, so as to give the house a good steaming. Recently potted plants, especially if they were much pot bound before being repotted, should be kept rather close and shady, with a thoroughly moist atmosphere, and very carefully attended to with water until they appear to have taken to the fresh soil. Vineries.—In the case of fruit intended to be kept as long as possible, the berries should be thinned, so that they will hardly touch when fully swelled, for it is scarcely possible to keep Grapes through the winter except they are severely thinned. Be particularly careful of the foliage of the Vines intended to furnish a late supply of Grapes, and if plants must be grown in the house see that they are not infested with black thrips or red spider, for if either of these pests is allowed to gain a footing on the Vines, the foliage will probably be greatly injured, and then there will be no chance of keeping the Grapes in good condition for any time after they are ripe. Muscats must be encouraged with a brisk temperature while setting.

FLOWER GARDEN AND SHRUBBERIES.

Although the weather has not yet been so warm as we could wish, and the bedding-out stock is not making much apparent progress, the plants are nevertheless rooting freely in light well prepared soil; and should we be favoured with a few weeks of warm sunshine, Verbenas and such things will doubtless grow away rapidly and soon cover the beds. Stir the surface soil either after heavy rains or artificial waterings as often as may be necessary to keep it light and open; but in doing this the roots of the plants which may be near the surface must not be disturbed. Should the weather become warm and dry see that the plants do not feel the want of moisture at the root. Thin out the shoots of herbaceous plants where crowded, and support those left with stakes before they get broken down, but avoid the too common practice of huddling a quantity of shoots to a single stake. Attend to the propagation of favourite hardy plants as cuttings can be procured, and endeavour to get a good stock of these things rooted while there is spare room, &c., at command; for the propagation of next season's bedding stock will soon require attention. Pansies are amongst the gayest of spring flowering plants, and if a good stock of cuttings can be got in now they will be found very useful for enlivening the borders next spring. Cuttings of the young shoots root freely under a handglass in a shady situation, and if planted out in rich soil will make nice stocky plants in course of the autumn, and may be transplanted to where they are to flower any time before winter or in spring. See that Roses are not being injured by green-fly or their enemy the "grub." If much infested with green-fly dip the shoots in tobacco-water, but if taken in time a good washing with the garden-engine will generally prove a cure. If not already done, get Brompton and Queen Stocks sown, selecting a bit of light open soil; and attend to them with water until fairly up and well established, which will be necessary in order to have strong plants before winter. Persevere with mowing, the destruction of weeds, and other routine work, and keep every corner clean and trim.

HARDY FRUIT AND KITCHEN GARDEN.

See that the Morello Cherry trees are not attacked by black fly, which is often troublesome on these at this season, and syringe with tobacco water and soap suds on the first appearance of the enemy, as, if neglected but for a short time, it is often difficult to eradicate, and greatly injures the trees. If syringing is found ineffectual in cleaning the trees, dip the points of the shoots in tobacco water. This is a somewhat tedious process, however, particularly where the shoots are short, and will seldom be found necessary if syringing is done in time, and before the pest gets established. Look over the Peach and Nectarine trees, and remove any shoots not wanted, which may have been left in disbudding, and do not knowingly leave a single shoot which will not be wanted at next nailing time. Also, attend to the timely stopping of breast wood and side shoots not wanted for laying in on wall and espalier trees generally, and the same attention should be afforded dwarf standards. The labour of keeping fruit trees in good order during the summer is not very considerable, and is well repaid in the improved appearance of the trees; but careful summer management is essential if a fruitful habit is to be induced, and well ripened fruitful wood secured before winter; and all useless wood should be kept closely stopped throughout the summer. Thin advancing crops, as Carrots, Onions, &c., early, and loosen up the surface of the ground after heavy rains. Give plenty of water to the planted out Celery, and also to the plants in beds for succession crops.

STATE OF THE WEATHER AT CHISWICK, NEAR LONDON,
For the week ending June 21, 1855, as observed at the Horticultural Garden.

Satur. 30	72.5	50.1	61.3	11	0.80	—	4	4	2	4	8	3	2

The highest temperature during the above period occurred on the 27th, 1826—therm. 93 deg.; and the lowest on the 30th, 1849—therm. 35 deg.

Notices to Correspondents.

Books: *G P S.* Johnson's "Dictionary of Modern Gardening."—*X Y Z.* You can scarcely expect us to say more of the "Theory and Practice of Horticulture" than we have said. *K.* No doubt "popular" works on botany are wretched. But who is to blame? The public will not pay for good works, but insists upon such as are cheap, and consequently has them. Do you expect publishers or authors to ruin themselves in order that the pocket of the "dear public" may be protected? People who pay no more than the price of trash, must be content with trash. Just as Mr. Bull, who insists upon jobbing whenever his own personal advantage is concerned, must be contented with the same practice when it benefits others and ruins himself. The common Liquorice plant, Glycyrrhiza glabra, is in all good works on œconomical botany. You will find it in Lindley's "Œconomical and Medical Botany," and in Pereira's "Materia Medica."

Diseases: *A K.* There is no fungus about your Grape leaves. They appear to be partially chlorotised; and if so, there is little doubt that there is something wrong about the roots. The Grapes will probably suffer, but you can do little at present. The state of the roots should be carefully examined in the autumn. *M. J. B.*

Grapes: *J P.* The brown marks indicate portions of the skin having been injured when young by being brought in contact with something improper; perhaps the hair of the man's head employed in thinning.

Greenhouses: *C W B.* There is no sort of objection to carrying your Vine up to a first floor before it enters your greenhouse, and if you can obtain a Vine with ripe wood long enough to pass inside the ground floor, let it do so. But if your Vine is to make its growth when it is planted before it enters, then you must carry it up outside. What you must take care of is that the border, or borders, no matter which, where your Vines grow, are so placed as to be warmed by the sun, and at the same time are not exposed to excessive dryness in summer. The materials you propose to use for your border are suitable.

Insects: *H W.* Your Aimée Vibert Rose is badly infested with the female Coccus, or Scale, similar to that of the Peach and Apricot. The young are just hatching, therefore you must at once destroy every specimen by picking them off and crushing them with your nail, or your tree will certainly perish.—*J B M.* The bees sent are the male and female of the Anthophora retusa, the history of which you will find in *Gardeners' Chronicle*, 1852, p. 340. The bees which cut the Rose leaves are narrower and more like the common bee, but are at once known by having the belly covered with orange plush. *W.*

Names of Plants: We have been so often obliged to reluctantly decline naming heaps of dried or other plants, that we venture to request our correspondents to recollect that we never have, or could have undertaken an unlimited duty of this kind. Young gardeners, to whom these remarks more especially apply, should bear in mind that, before applying to us for assistance, they should exhaust their other means of gaining information. We cannot save them the trouble of examining and thinking for themselves; nor would it be desirable if we could. All we can do is to *help* them—and that most willingly. It is now requested that, in future, not more than four plants may be sent us at one time.—*Beta.* The common Scorpion Senna or Coronilla Emerus.—*A M K.* Tellima grandiflora.

The Deodar: *D.* The male catkins are very young. They appeared two years ago at Bury Hill, near Dorking, on the trees of Mr. Charles Barclay.

Misc: *A Subscriber.* The new law compels us to stamp the Paper on the *outside* page; if the stamp were printed *inside* it would very rarely be folded so as to expose it.

*** As usual, many communications have been received too late and others are unavoidably detained till the necessary inquiries can be made. We must also beg the indulgence of those numerous correspondents, the insertion of whose interesting contributions is still delayed.

PEAT CHARCOAL.

THE PEAT CHARCOAL COMPANY beg to inform Agriculturists, Florists, &c., that they can be supplied with the above valuable deodoriser, fine in boxes, and coarse in sacks, by applying to their Agents, MARK FOTHERGILL & Co., 204A, Upper Thames Street, London.

PERUVIAN GUANO, Bolivian Guano, Superphosphate of Lime. Nitrate of Soda, Sugar Scum, and every description of Artificial Manures, Linseed Cakes, &c.
WM. INGLIS CARNE, 10, Mark Lane, London.

PATENT SANITARY SEWAGE COMPANY'S NITRO-PHOSPHATED CARBON OR BLOOD MANURE, 5l. 15s. per ton; delivered in London, bags included. Each ton contains 1350 lbs. Blood and 11 per cent. of Phosphate of Lime.—Agents throughout the country.
22, Lincoln's Inn Fields, London.

TURNIP SOWING.—The Undersigned beg to offer their valuable Supherphosphate of Lime (See "Royal Agricultural Society's Journal," Vol. VI., Part 2), Turnip Manure, and Nitro-phosphate or Blood Manure.

Also on sale, Guano, Nitrate of Soda, Gypsum, Bone-dust, Sulphuric Acid, Salt, and all other Manures of known value. Agents for the sale of Peat Charcoal.—Apply for Prices Current to MARK FOTHERGILL & Co., 204A, Upper Thames Street, London.

CORN MANURE FOR SPRING SOWING.
CONCENTRATED URATE FOR GRASS, RAPE, AND ALL ROOT CROPS.
SUPERPHOSPHATE OF LIME.

THE LONDON MANURE COMPANY continue to manufacture the above Manures, which have been used with so much success for the last 14 years.

The London Manure Company also supply PERUVIAN GUANO direct from importers' warehouses), Nitrate of Soda, Sulphate of Ammonia, Fishery and other Salts, Bone Dust, and every artificial manure of known value. EDWARD PURSER, Sec.
Office—40, Bridge Street, Blackfriars.

THE FOLLOWING MANURES are manufactured at Mr. LAWES' Factory, Deptford Creek:—Turnip Manure, 7l. per ton; Superphosphate of Lime, 7l.; Sulphuric Acid and Coprolites, 6l.

Office, 69, King William Street, City, London.

N.B. Genuine Peruvian Guano, guaranteed to contain 16 per cent. of ammonia. Nitrate of Soda, Sulphate of Ammonia, and other Chemical Manures.

MANURES.—The following Manures are manufactured by HODGSON & SIMPSON, Calder Soap Works, Wakefield, and MATTHEWS & Co., Manufacturing Agricultural Chemists, Driffield. SIMPSON'S AMMONIA PHOSPHATE, a valuable Top-Dressing for Wheat, Barley, and Oats. SIMPSON'S NITRO-PHOSPHATE for Turnips, Potatoes, and all other bulbous root crops, price 8l. per ton. N.B. Manures specially prepared for Grass and Flax. The above have been successfully tested for the last Seven Years by the leading farmers in Yorkshire and Lincolnshire, and other counties, and were applied last season to a breadth of upwards of 15,000 acres of land with the most beneficial results to the crops. A List of Testimonials and other particulars will be forwarded by post on application.

ARTIFICIAL MANURES, &c.—Manufacturers and others engaged in making ARTIFICIAL MANURES may obtain every necessary instruction for their economical and efficient preparation, by applying to J. C. NESBIT, F.G.S., &c., Principal of the Agricultural and Chemical College, Kennington, London. Analyses of Soils, Guanos, Superphosphates of Lime, Coprolites, &c., and Assays of Gold, Silver, and other Minerals, are executed with accuracy and dispatch. Gentlemen desirous of receiving instructions in Chemical Analyses and Assaying, will find ample facility and accommodation at the College.

COLLEGE OF AGRICULTURE AND CHEMISTRY, AND OF PRACTICAL and GENERAL SCIENCE, 37 and 38, Lower Kennington Lane, Kennington, near London.
Principal—J. C. NESBIT, F.G.S., F.C.S., &c.

The system of studies pursued in the College comprises every branch requisite to prepare youth for the pursuits of Agriculture, Engineering, Mining, Manufactures, and the Arts; for the Naval and Military Services, and for the Universities.

Analyses and Assays of every description are promptly and accurately executed at the College. The terms and other particulars may be had on application to the Principal.

UNIVERSITY COLLEGE, TORONTO, UPPER CANADA.
AGRICULTURAL DEPARTMENT.

THE PROFESSOR OF AGRICULTURE, who resides on the Experimental Farm attached to the College, is prepared to receive into his family a small number of Pupils, who will have the advantage of entering on an extensive course of Collegiate Studies in connexion with Agriculture, on very easy terms.—Particulars and References may be obtained of Mr. H. G. AUSTEN, 259, High Street, Borough, London; or by addressing Professor BUCKLAND, University College, Toronto, Upper Canada.—June 1855.

THE GENERAL LAND DRAINAGE AND IMPROVEMENT COMPANY
INCORPORATED BY SPECIAL ACT OF PARLIAMENT.
Offices, 52, Parliament Street, London.
DIRECTORS.
HENRY KER SEYMER, Esq., M.P., *Chairman.*
SIR JOHN V. SHELLEY, Bart., M.P., *Deputy-Chairman.*
George Thomas Clark, Esq.
John C. Cobbold, Esq., M.P.
Sir William Cubitt, F.R.S.
Henry Currie, Esq.
Thomas Edward Dicey, Esq.
William Fisher Hobbs, Esq.
Edward J. Hutchins, Esq., M.P.
Sir S. M. Peto, Bart.
William Tite, Esq., F.R.S.
William Wilshere, Esq.

Empowered to execute Drainage, Road-making, and other Land Improvements, and to Erect Farm Buildings upon Estates under Settlement, Mortgage, or otherwise; or Church property, and without investigation of Title to charge the whole outlay and expenses upon the Estate, to be repaid by instalments spread over any period determined by Landowners within the limits of 50 years for Drainage and Roads, and 31 years for Farm Buildings.

Landowners may arrange with the Company for the execution of the works by their own agents, with the use of their own or the Company's Capital. WILLIAM CLIFFORD, Sec.

CLAYTON, SHUTTLEWORTH, & CO.'S PRIZE PORTABLE STEAM ENGINES, AND COMBINED THRESHING, STRAW SHAKING, RIDDLING AND WINNOWING MACHINE may be seen at their London Establishment, 6, Fitzroy Terrace, New Road, where all information relative thereto can be obtained. These Machines are constructed to thrash Barley, and make a perfect separation of the chaff from the pulse. They are fitted with Elevators, which deposit the grain into bags, and beyond the feeder of Machine require no hands except to take away the Corn, &c., as threshed, the whole of the operations being performed by self-acting machinery, whereby the Corn, Straw, Chaff, and Pulse are delivered in the places assigned for them.

C. S. & Co. have paid special attention to this class of Machinery, and Fixed Barn Machinery, and from the position they have taken at the Royal and all the leading Agricultural Shows of England, flatter themselves that for efficiency, durability, and simplicity, their Engines and Machines are not surpassed by any other maker in England. All letters forwarded to the Works at Lincoln will have immediate attention; and Illustrated Catalogues forwarded to all parts of the kingdom postage free.

WARNER'S IMPROVED LIQUID MANURE, OR GENERAL PORTABLE PUMP.

The valve is a ball of imperishable material, and cannot clog in action. The barrel is of galvanised iron, not likely to corrode, and can be raised or lowered at pleasure. The legs will fold together, and the whole may be carried on shoulder to any pond or tank required.

Price of 4½ in. Pump, with legs, 3l. 3s. The barrel is 27½ in. long, and the legs are 5 ft. high.

1½ inch Gutta Percha Suction Pipe, 1s. 6d. per foot.

1½ inch Flexible Rubber and Canvas Suction Pipe, 3s. 6d. per foot.

May be obtained of any Ironmonger or Plumber in town or country, at the above prices, or of the Patentees and Manufacturers, JOHN WARNER & SONS, 8, Crescent, Jewin Street, London.

Every description of Machinery for Raising Water, by means of Wheels, Rams, Deep Well Pumps, &c.; also Fire and Garden Engines, &c.—Engravings sent on application.

WARNER'S PATENT VIBRATING STANDARD PUMPS.

PATENT CAST-IRON PUMPS, for the use of Farms, Cottages, Manure Tanks, and Wells of a depth not exceeding 30 feet.

Diameter of Barrel	Length of Barrel, under nose.		£ s. d.
2½ in.	short 1 ft. 7 in.	Fitted for lead, gutta percha, or cast iron flanged pipe, as required.	1 12 0
2½ „	long 3 „ 3 „		1 15 0
3 „	ditto 3 „ 6 „		2 12 0
3½ „	ditto 3 „ 6 „		2 18 0
4 „	ditto 3 „ 6 „		3 5 0
2½ „	short, with 15 feet of Lead Pipe attached, and Bolts and Nuts ready for fixing		2 12 0
2½ in.	long ditto	ditto ditto	2 15 0

The short barrel Pump is very convenient for fixing in situations of limited height and space, for the supply of coppers and sinks in Wash-houses with soft water from underground tanks, or in Hot, Forcing, and Plant Houses; they may be fixed, when desired, under the stage.

May be obtained of any Ironmonger or Plumber in Town or Country, at the above prices, or of the Patentees and Manufacturers, JOHN WARNER AND SONS, 8, Crescent, Jewin Street, London.

Every description of Machinery for Raising Water, by means of Wheels, Rams, Deep Well Pumps, &c.; also Fire and Garden Engines, &c. &c.—Engravings sent on application.

JOHN WARNER AND SONS,
Crescent, Jewin Street, London.
GALVANISED IRON TUB GARDEN ENGINE,
WITH WARNER'S REGISTERED SPREADER,

is strongly recommended, for durability and low price, viz., 2l. 19s., to hold 10 gallons.

Larger sizes in wood or iron, viz., 14 gals., 24 gals., & 35 gals. May be obtained of any Ironmonger or Plumber in town or country, or of the Patentees and Manufacturers, as also Machinery of all kinds for raising Water from any depth to any height by Steam, Horse, or Manual Power. Prices sent on application. Syringes of various constructions and sizes from 9s. upwards. Metallic String from 5d. to 1s. 3d. per lb.

JOHN WARNER AND SONS, 8, Jewin Crescent, London, Manufacturers of FIRE ENGINES, PUMPS, GARDEN ENGINES, and SYRINGES.

All articles of JOHN WARNER & SONS' manufacture may be obtained of any Ironmonger or Plumber in town or country, at the advertised prices.

JOHN WARNER & SONS having been practical Horticulturists for many years, know exactly the requirements of both Amateurs and Gardeners. A gardener with a properly constructed pump will get through as much work in five minutes as he could with any Syringe in a quarter of an hour, and with half the labour to himself. Syringes are economical for small houses.

No establishment offers such a variety of effective machines for hydraulic purposes, whether to supply Gardens, Hothouses, Cottages, Farms, Mansions, or Boards of Health, with every requisite connected with the conveyance and distribution of liquids.
Fountains suitable for Conservatories, Lawns, &c.
Sheets of Engravings sent on application.

BLACK JAPAN VARNISH.—This article will be found from its durability and cheapness of the greatest utility for Painting Hurdles, Wire-work, Palings, Gates, Fences, &c., and out-door work of every description, whether of Wood or Iron. Its value has been proved by the test of time. It should be well stirred up before using and applied cold. This Varnish will retain its quality for any length of time, provided the cask be kept closed.

May be obtained through any ironmonger; or of JOHN WARNER & SONS, 8, Jewin Crescent, London.

N.B. Sold in casks containing 28, or 14 gallons, at 2s. per gallon. Casks (which cannot be returned), 5s. each.

WEDLAKE'S NEW HAY-MAKER, only 10l. 10s. 6d., cash in advance. Wedlake's New Horse Hay Rake, cash in advance, 3l. 15s. 6d. Book on Making Hay Cheap, 1s. Book on Feeding Horses Cheap, 1s. List of 260 Cuts of Machines, 1s.—118, Fenchurch Street, City.

BUDDING'S GRASS-CUTTING MACHINE, nearly new and in first-rate condition, to be Sold a bargain. Cuts, Rolls, and Sweeps the Grass whether wet or dry at one operation. Admirably adapted for lawns, pleasure grounds, &c. On view at W. S. MULLINGER'S, General and Furnishing Ironmonger, Enfield, Middlesex.

W. S. M. has also on sale a large and well assorted stock of Garden Tools of every description. Galvanised Wire Netting, 3-inch mesh, 2 feet high, 6d. per yard run. Iron Hurdles and Continuous Fencing made to order. Greenhouses or Conservatories heated with hot water apparatus on the best principle by experienced workmen. Estimates given.

SAMUELSON'S REGISTERED LAWN MOWING MACHINES. To cut 16, 19, 22, and 25 inches wide. The Registered Improvement renders unnecessary the great care requisite in the handling of these Machines on the old plan. All that is now required can be done *by any unskilled labourer*, who has only to push the Machine before him, the Registered Adjustment insuring a clean cut of uniform height, and preventing the knives from cutting into the soil, however uneven the ground may be. Illustrated Price Lists, with copies of Testimonials, and a Catalogue of his other Agricultural Implements, may be procured, post-paid, on application to the Manufacturer,
B. SAMUELSON, Britannia Works, Banbury, Oxon.

The above may also be procured at the principal Agricultural Implement Depôts in London, and of all respectable Ironmongers and Seedsmen in the country.

ANERLEY POULTRY SHOW.—
President—The Right Hon. the Earl of VERULAM.
Vice-President—Sir JOHN PETER BOILEAU, F.R.S., Vice-President of the Zoological Society.

The FIRST EXHIBITION of POULTRY and PIGEONS will be held in the Anerley Gardens, adjoining the Anerley Station of the London and Croydon Railway, and near the Anerley Entrance to the Crystal Palace grounds, on TUESDAY, WEDNESDAY, and THURSDAY, August 28, 29, and 30.

The value of the Prizes will exceed 300 guineas. A detailed List of the Prizes and Certificates of Entry may be had on application to the Secretaries at the Office, Anerley, Surrey.

By Special Permission the BAND of the ROYAL ARTILLERY will attend each day during the Exhibition.

EDGAR SMALLFIELD, HENRY F. WELLS } Hon. Secretaries.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

THE ROYAL AGRICULTURAL SOCIETY OF ENGLAND desires to receive Tenders from Innkeepers or others to Contract for the supply of A COLD DINNER, at CARLISLE, on THURSDAY, the 26th of July next, in the Society's Pavilion, constructed to accommodate 800 persons.—Printed forms of Tenders may be obtained on application to the Secretary, 12, Hanover Square, London, and must be returned to him, filled up, on or before SATURDAY, the 30th of June, the Society not binding itself to take the lowest Tender. By Order of the Council,

London, June, 1855. JAMES HUDSON, Secretary.

The Agricultural Gazette.

SATURDAY, JUNE 23, 1855.

MEETINGS FOR THE ENSUING WEEK.
WEDNESDAY, June 27—Agricultural Society of England.

THE attention of our readers will be directed to the valuable paper by Mr. SCOTT read before the English Agricultural Society last Wednesday, which we publish in another column. It is an exceedingly instructive account of the writer's own long and extensive experience, and that of others, on this important subject, which, thanks to Mr. HORSFALL, has occupied so much attention this season. The points referred to are the relative profitableness of churning from cream and whole milk—the relative merits of several dairy breeds of cattle—the application of machinery to the manipulation of butter previous to sale—the defects of dairy management in Ireland and elsewhere as compared with what is prevalent in Holland—and the richness of milk and cream respectively in connection with several modes of feeding. On all these particulars the paper is remarkably instructive, and deserves a careful perusal.

THERE are large tracts of barren land and of land comparatively infertile, owing to the very light sandy character of their soils; and there are districts which have been thus infertile, but are so no longer. It is worth while to consider the history of such improved soils, as it must relate the method by which a very serious cause of infertility in this country can be best overcome. The Holkham estates in West Norfolk are a district of this kind, and Lord SPENCER has related their history in the third volume of the Agricultural Society's Journal. Eighty years ago, when Mr. COKE came into possession of this property, all the land round Holkham was unenclosed; it let for 3s. per acre, and could not be relet for more. The sandy soil, weak naturally, was impoverished by the treatment it received at the hands of an unenterprising, unintelligent tenantry. In order to get it into better condition, it was necessary both that manure should be applied, and that the soil should be strengthened minerally; crops might then be grown on which an increased stock could be kept, and these would furnish the manure by which the increased fertility should be rendered permanent. Rape-cake was applied as a top-dressing, in order to provide the organic portion of a fertile soil, and the marl which lay beneath was excavated and applied so as to provide the deficient mineral portion of a fertile soil: "This," says Lord

Spenser, "not only increased its fertility, but gave to the soil the solidity which is essential to the growth of Wheat. By these means Clover and other artificial grasses were raised, and the power of keeping more stock was obtained." And the present Norfolk mode of husbandry became possible and profitable upon an infertile sand treated in this manner.

Lincoln Heath and Lincoln Wolds are other notable instances of sandy and chalk wastes respectively reclaimed. Their history has been told so often that it is useless to repeat it. Land formerly a continuous rabbit warren is now worth 30*s.* an acre to rent, and exhibits agricultural wealth on the part of its cultivators such as no other county boasts of. The means employed have been the application of chalk to the wolds, after grubbing up the Gorse which occupied the waste, and dressing heavily with bone-dust; marl too is applied along the western edge of the chalk where it adjoins the beds of calcareous clay lying beneath it in the geological scale. These means, followed up by the growth of large quantities of food for sheep consumed upon the land, maintain the former waste at its present high pitch of fertility. The Heath district upon the oolite beds of Lincolnshire has been rendered fertile in a somewhat similar manner. Immense quantities of oil-cake are consumed by sheep upon it, and large quantities of Rape-cake and bone-dust are applied directly to the land. These, and the manure from the sheep fed upon it, the consolidation as well as the fertilising matters thus given to the soil, ensure "noble crops upon land for which a few years since the rent was paid by two rabbits an acre." The full history of these districts will be found in Mr. Pusey's report published in the fourth volume of the Journal, and Mr. Clarke's published in vol. 12.

A particular instance of the treatment of a light sandy soil may be given here in which a farm of many hundred acres is concerned. A large portion is still under the thick close covering of ling by which the sandy waste is covered. Immediately around the house, which is sheltered by plantations of Larch and Fir, portions of the land are under cultivation, and in pasture. The first step towards the attainment of fertility obviously is to remove the present vegetable covering of the land, and that is being done by breast plough, common plough, hook and grubbing axe, and fire. The land, when ploughed and properly reduced, is partly sown with Oats, and partly cultivated for Turnips; and considerable dressings of guano, bones, and Rape-cake are applied to ensure a crop. The application of lime, too, has been of essential benefit. The consumption of the roots upon the land with sheep, their consumption along with oilcake there, gives a manuring and consolidation which prepares the soil for grain crops; and very soon, no doubt, simply by these means—for clay has not been found within a profitable distance, by which the mineral faults of the soil might be corrected directly—land which yields now perhaps less than it did when the "horned cattle" of Robin Hood browsed its herbage, will be as productive as the once sandy wastes of Lincolnshire and Norfolk.

The remedies then for this source of infertility which observation has recorded, are the application of marl and clay, the use of bone-dust and of Rape-cake, and the consumption of green crops and of oilcake upon the land by sheep. It is reasonable to suppose that the earliest instances of reclamation from the state of rabbit warren have been those of greatest original promise, though Mr. Brett, Lord Leicester's tenant, did not consider his case very promising when he refused to renew his lease at an advance of 2*s.* per acre: but the sandy wastes that still remain—those of Notts, and Hants, and Surrey—though we do not see upon them rabbits burrowing amidst nettles, as Young did greatly to his indignation on the wolds of Lincolnshire, are yet not altogether without promise in the natural vegetation which covers them. The Fern and Gorse are not altogether absent, and there is many a tract, especially in the southern countries, whose neighbourhood geologically furnishes the remedy which their light and sandy character requires. The use of water as a fertiliser upon sandy soils—such facts as have any bearing upon that point—will be considered in the sequel.

Although an observer of the imperfect action of the plough upon heavy land may regard it as a "doomed implement," upon light land it is very efficient, and when followed by the seam-presser leaves little to be desired in the way of completeness; for the object on thin light soils is not so much pulverisation as a moderate degree of division, retaining as much solidity as is compatible with the growth of a crop. Wherever a thin staple obliges a shallow system of tillage, an implement worked by traction seems even more suitable than one that digs vertically; and hence the plough, when hereafter expelled from sticky clays and bottomless loams, may take refuge upon the thin sands and scantily-covered rocks. Let us, therefore, encourage Mr. Williams in his attempted steam-ploughing on the Wiltshire hills.

Our views should be comprehensive: not looking for a steam cultivator merely upon deep soils, fortunately free from obstructing stones, but wherever workmen and horses are engaged in cultivation. Steam-power performing our principal tillage operation—that is, breaking up whole ground, burying the last crop with its weeds, and turning up a fresh seed-bed for the next—ought surely to be a radical and gigantic improvement throughout our national husbandry; so that it behoves public-spirited agriculturists, in every part of the kingdom, to seek the help of the mighty motor for whatever kinds of tillage may be suited to their district.

General opinions of the theory of cultivation, and varying practical deductions from them, have tended to bewilder while instructing the machinist; and have hitherto left him in doubt whether he is to plough, dig, or grate into powder. But why should not *existing practice* in all its adaptations to particular soils be taken as the guide in the first instance? Let the first aim of inventors be to make steam-power plough where ploughing answers best; delve and fork where deep working is most effectual, and scratch where such comminution is found to be profitable. When this has been achieved, any universal method fitted for all soils may be safely left for future discovery.

Now, in light-land farming, what sort of tillage forms—and from the nature of the ground must continue to form—the fundamental or first operation: is there most need for digging, ploughing, or grubbing? In answering this question, let us just refer to the general character of our light soils, which, from their extensive distribution, demand a share in the benefits of steam-culture—although their mechanical may be scarcely so important as their chemical treatment.

Tracts of light land are interspersed throughout all our clays, such as those on the red sandstone and plastic clay; but are most prominent in England upon the upper chalk, the upper oolite, and the arenaceous deposits of the Hastings sand and various other formations; and in Scotland, upon the older strata of granite, gneiss, trap, &c. The flinty chalk soils are sucked dry by their open and absorbent subsoil; and the tendency of both these soils and those of the thin oolite stonebrash to let the rains run through them, instead of closing up and retaining the moisture like siliceous soil, leads the farmer to plough and cultivate as little as possible in preparing for a fallow crop. The stubble is broken up by grubbing and broadsharing about 2 inches in depth, and after being harrowed and cleaned, the land is ploughed with a shallow furrow—generally burying a dressing of yard-manure. In spring, another scuffling or two, without any further ploughing, completes the main part of the preparation for Turnips. When the roots are gone, a light ploughing, followed by the cultivator, or on very dry light soils by the press-roller, together with a harrowing, prepares a seed-bed for Barley. For other green and grain crops the tillage is much the same; only in breaking-up Clover lea for Wheat, a skim-plough is employed, which cuts off the Clover or Grass roots from the upper edge of the furrow slice and throws it in the bottom of the previous furrow, so that there shall be no vegetation springing up from the seams. The presser is also used to consolidate the furrows and provide a firm seed-bed. Both the upper chalk and upper oolite soils abound with flints or rubbly stones; and an implement afraid of these will have a very limited field of action.

The sandy soils of England are scattered in every county, and are most prevalent upon the Hastings sand, plastic clay, red sandstone, millstone grit, and magnesian limestone formations. Scarifying, dragging, and ploughing, some 5 inches deep, are the principal tillage operations; two ploughings being sufficient in preparing for Turnips, while the grubber forms the chief spring implement—from fear of drought. The finest and mellowest seed-bed for Wheat is obtained by simple ploughing and seam-pressing, and for no purpose is deep-working resorted to. For planting Potatoes and some other crops, the plough is brought into requisition to bury the needful dressing of manure.

We come next to the trap or whinstone soils and limestone gravels of Scotland—like the light lands already referred to, consisting of a loose brownish earth, plentifully intermixed with small stones. Ploughing to a considerable depth is practicable in some situations; but cultivation for Oats and Turnips is carried up the hills wherever soil enough can be got to cover the ploughshare. A moister climate enables a more frequent use of the plough in spring upon the same quality of land that, in the more arid south, must be worked by the grubber instead; and besides ordinary ploughing, the operation of ridging or drilling is very common.

From the foregoing statements, then, we conclude that a steam-cultivator to be valuable on light lands must be able (in the first place) to cut up and mince, or else slice and divide, firm ground, for *only 2 inches in depth.* As the weight of a steam-engine would be little detriment to such land, the locomotive principle, with an attached revolving tiller, seems appropriate; but on the other hand these light soils being generally steep or undulating, the difficulty of working the gradients on a soft and rugged way, points rather to the traction principle as being preferable. Whichever system is adopted, the machine must be also able (in the next place) to slice and *effectually invert* a staple of loose stony soil 5 *inches, or it may be only* 4 *inches, in depth,* burying every portion of the old surface, together with the *manure spread upon it;* and leaving the up-turned soil in pieces as *firm* and as *closely laid* as furrow slices are now left by the plough. The work can scarcely be better done than by the plough itself; why not, therefore apply steam-power to draw either broadsharing, grubbing, or ploughing implements (as required) after Mr. Williams's or some other person's plan? Let us by all means welcome attempts of this order, thus shown by actual practice to be fitted for light lands.

I. A. C.

EXPERIENCES IN LAND DRAINAGE.

No. XVI.—Successful in every instance.—Drains parallel; and from 3 feet 6 inches to 4 feet 6 inches deep, depending upon the fall to be obtained, and upon the stratum in which the water usually lies.—Four feet is the average wished for.—Meadow land has been usually done in the same way, but the distance between drains about one-third wider.—The drains are with the fall. In meadow land the furrows are usually followed: in arable land seldom, unless the ridges are very wide, and consequently high.—In this neighbourhood 2-inch pipes are almost always used for minor drains, 3 and 4-inch for mains. In the west riding of this county I have sometimes used collars where a good bottom was not to be procured, and the depth of minor drains is regulated by the fall to be obtained.—I have used air drains in Cumberland—1½-inch pipe and collared minor drains—with great benefit. With Government grants of money, the Assistant-Commissioners do not think them necessary.—The average number of acres discharging at one outfall I cannot give, as it depends entirely on the fall, from 3 or less to 40 or more acres.—I have drained from poorest clay to richest loam, and then again to weakest peat and sandy soil. Subsoil stiff clay with shale, clay, occasional seams of gravel, sandstone. *Francis Parker, Rokeby Grove, Greta-bridge, Yorkshire.*

No. XVII.—Successful in all cases where the land has been drained at a depth of 4 feet and upwards.—I have adopted a parallel system, taking the greatest descent, and draining 4 and 4½ feet deep.—In Grass land the drains are laid on a greater distance apart, and for the most part at a greater depth, as it is not considered necessary to have the water so quickly carried off Grass land as tillage.—I have drained with the greatest fall, excepting where the old furrows are very deep, and lying not far out of the line having the greatest descent, as I consider there is more lost in the extra cutting caused by crossing the high ridges than gained by taking the greatest descent. The furrows have only been followed where lying in a right direction, and falling at the proper distance apart, except in particular cases, as before named.—The tiles used have been 2-inch for the parallel drains, and 3, 4, 5, and 6-inch for the mains. Collars have been used in all cases where the subsoil was of a sandy nature.—I have never tried giving air to drains, as I consider it could be of no possible benefit, but might possibly do damage by allowing flood water, &c., to get into the drain; and were it possible to have made the pipe a perfect vacuum, the water would be forced in with increased velocity, and as the water got discharged from the land the air would naturally follow.—The average acreage discharging into an outfall depends upon the size of the pipe with which the main drain is laid; I consider a 4-inch pipe on an average and in porous subsoil will discharge from 12 to 15 acres: a 5-inch pipe, 20 to 25 acres, and a 6-inch from 30 to 36 acres, but so much depends upon the subsoil and the distance of the drains apart.—The soils and subsoils drained have been various where of a porous description and on tillage lands the drains, when 4 feet deep, are laid on an average about 12 yards apart; where the subsoil is a tenacious clay, not more than 8 yards apart. *G. M. Dixon, Netherington.*

No. XVIII.—Successful, provided the depth and distance of the drains correspond with the porosity or tenacity of the subsoils.—A parallel system has been adopted where the land has a tolerably even surface.—Drains 4 or 4½ feet deep.—The difference made between arable and Grass draining is only as regards the distance the drains are put apart, it being necessary that arable land should have the parallel drains closer, that the water should, after heavy rains, pass more rapidly off.—The minor, or parallel drains, are almost invariably

laid with the fall. The furrows are only followed when they suit the direct fall of the surface, and the width the drains are intended to be put apart.—Two-inch circular pipes are used for minor, and 3, 4, 5, and 6-inch circular pipes for the mains, and collars are used where the bottoms of the drains are soft or doubtful.—I never thought air pipes worth a trial, feeling confident that if the water found its way to the drains air would follow. —About 15 acres flow out at one outfall.—All kinds of soils and subsoils have been drained, from the most porous gravel to the most tenacious clay.—*Josh. Snowball, Netherwilton, Morpeth.*

No. XIX.—The result of my drainage operations on all descriptions of land has been satisfactory so far as time has proved them.—The drainage adopted is on a parallel system.—The prevailing depth of the drains is 4 feet, and 8 yards apart.—No difference has been made in the mode of draining between arable and Grass land. —The direction of the minor drains is aslant the fall; and the furrows have generally been followed.—Two and a half inch pipes have been used for the minor drains, and 3, 4, or even 5-inch bore for the mains; I have used sockets in quick sands.—I have found benefit by giving air at places to drains.—The average number of acres discharging at the several outlets is 10.—The soil and subsoil strong loam on red marly clay highly charged with limestone, with sandy fissures at draining depth.—The geological formation is a deep bed of marl upon red sandstone.—The height of the land drained is little above the sea level.—The average depth of rainfall in my neighbourhood is 40 inches. I beg leave to state that whereas the land referred to has heretofore been sown to Wheat, &c., on high and narrow ridges, it is now for the first time sown on the flat. The benefit anticipated from this result of drainage alone is considerable. Allow me further to observe that as on drained or dry land only we can dispense with the butt and furrow principle, neither can we, except on flat land (land without ridge and furrow), have equalisation, of 1st, the surface soil; 2d, the seed sown (the drill being used); 3d, the manure spread; and 4th, of the rain that falls, &c., &c. The benefits of draining, we believe, are severally very great. *For Samuel Brooks, Esq., Thos. Suttle, Manchester.*

Home Correspondence.

Steam Cultivation.—Everybody knows that the whole office of a steam engine is simply to turn a wheel; but everybody does not know how to turn a wheel so as to pulverise the surface of the earth. Everybody knows that Mr. Hoskyns has demonstrated that the surface soil intended for cultivation ought to be ground up into the pulverulent condition by a wheel; but, unluckily, neither he nor the professed mechanists know how to grind. Mr. Hoskyns's deductions terminated in the "vertically circular," which will not answer. All that I shall say at this time is, if these inventors really desire to know how to grind, I advise them at once to go to the nearest mill; they will there see how the upper and the nether millstone operate; and then if they know how to apply the lesson received through their eyes they will soon be able to solve the problem of cultivating land by mechanic agency. Prediction before an event is far more attractive to certain investigators than any observation after trial. On the ground that I once devoted much time to the consideration of the introduction of steam to cultivation, allow me to make a few remarks for the meditation of your readers. Of course my observations will only have a reference to inventions past, and not to those new inventions which may be prepared for the grand trial at Carlisle next month. So far as I am acquainted with the past attempts to apply steam to tillage, I have no hesitation in affirming that the agricultural mechanist has not exhibited familiarity with the process of invention, nor the farmer any true idea of the consequences to be expected from the advent of a new power to another department of his practice. It is unnecessary to particularise the past attempts to cultivate land by steam-power—all are well known; and what is the inference? Why, from their extraordinary unanimity on one point, namely, of *method*, we must arrive at the conclusion that both the agriculturist and mechanist expect to obtain the boon of the above power unconditionally—that is, without complying with any "conditions." They take it for granted everything—steam-power amongst the rest—will follow in the wake of the plough; that its introduction will not disarrange in the least old methods or machines. Now I will show, by quoting only two instances from past experience, that the inference is fairly against such ideas on their part. The first I shall adduce is that of the railway system: here the conditions required to be fulfilled were that the old track or common roadway should be abandoned, the stage coaches demolished, the posting system abolished, and the roadside public-houses shut up; for the railway locomotive demanded a new roadway, and a new mode of conducting conveyance peculiar to its nature. The second illustration is that of telegraphing by electricity; this new method of conveying messages demanded as a premium for its introduction that the method of solid sign-boards visible to the naked eye at certain assigned distances should be abandoned; the method of breaks and intervals of space be renounced, and in lieu thereof a connected material body be extended, and touch in one unbroken line every required point in the line of transmission. Now, these two illustrations will serve as well as a hundred to show that on the right introduction of a new power to accomplish an old purpose, it always changes the "method" of proceeding. Hence what is the inference in respect to the right introduction of steam into the field! Why, that it will demand a totally different "method" of operating, will demolish all clod-crushers, drills, hoes, and harrows, and adapt the materials to its own method of working—probably will require a system of stations for manuring, cattle feeding, corn threshing, and storing, &c. Now, of course I only infer this, that is guess it (as some would term it); but does the farmer seem to anticipate any such consequences? From what I have observed, he does not; in fact, has made up his mind nothing of the sort need occur. Has the mechanical contriver of steam-cultivators, up to the present day, even evidenced by his inventions, that any such radical changes in "method" and machinery would arise on the right introduction of steam power to the field? Most decidedly not, for all can observe he has tacitly undertaken to gear steam power on to the whole *modus operandi* of the farmer in the field, without alteration. *Charles Burcham, London, June* 16.

Mr. Horsfall's yield of Butter.—Observing that Mr. Horsfall's statements concerning the quantity of butter yielded by his cows, when fed on Rape-cake, have been considered extraordinary, and his accuracy even questioned, I have been led to compare them with certain results of different feeding, given in a tabular form in No. 15 of your Journal, published April 14. From the comparison it appears that the amount of butter obtained by Mr. H. is far from extraordinary, and that the peculiarity of his experience lies in this, that he obtains from a given quantity of milk a much less quantity of cream but of greater density, from which when churned he obtains a quantity of butter greater in proportion to the quantity of cream, but not greater in proportion to the quantity of milk from which it originates. For instance, if we compare Mr. Horsfall's statements in last week's paper with No. 3 in the table alluded to, we find that Mr. H. produces 25¼ oz. of butter from 1 quart of cream, but that it requires 16 quarts of milk to produce that quart of cream, whereas in the case of the cows fed on the second cutting of Clover, 1 quart of cream is obtained from less than 6 quarts of milk, and therefore though this quart when churned does not produce quite 11 oz., yet as there were more than 2½ quarts of cream obtained from 16 quarts of milk, the quantity of butter produced was 29¼ oz., or ¼ lb. more butter than Mr. H. obtains from the same quantity of milk. As it may be interesting in the present stage of the discussion I have reduced the table, which I now give in a form convenient for comparison.

No. of Experiment.	Kind and Quantity of Feeding per head daily.	No. of quarts of milk to produce 1 qt. of cream.	No. of quarts of cream to produce 1 lb. of butter.	No. of quarts of milk to produce 1 lb. of butter.	No. of quarts of cream produced by 16 qts. of milk.	No. of ozs. of butter produced by 1 qt. of cream.	No. of ozs. of butter produced by 16 qts. of milk.
	Mr. Horsfall's cows on Rape-cake, &c.... ...	16	.63	10.14	1	25¼	25¼
1	70 lbs. of Mangold and 50 lbs. of Turnips... ...	7.43	1.21	9	2.15	13.2	28.4
2	Ital. Rye-grass *ad libitum*	6.01	1.53	9.22	2.66	10.46	27.8
3	Second Cutting of Clover	5 95	1.46	8.73	2.69	10.9	29.3
4	Cabbages	6.26	1.48	9.29	2.56	10.75	27.5
5	Mangold leaves and Cabbages	6.89	1.56	10.8	2.32	10.2	23.7
6	Mangold leaves alone ...	6.67	1.47	9.86	2.4	10.8	25.9
7	50 lbs. of Mangolds and 60 lbs. of Turnips ...	7.22	1.25	9.08	2.21	12.76	28.2

From these results it appears that the amount of butter obtained by Mr. H. from a given quantity of milk is, with one exception, less than in any of the experiments here recorded; unless, therefore, there be some error in the experiments, Rape-cake is far from taking the pre-eminence as a butter-producing food. How far the increased density, but diminished quantity, of cream in Mr. Horsfall's practice is owing to Rape-cake as a food would be an interesting subject of inquiry. Mangolds and Turnips, as compared with the other foods in the experiments, tend in a slight degree to produce this effect. *D.*

On Hoeing Wheat.—We notice in the *Mark Lane Express* an inquiry as to the utility of hoeing thin plants of Wheat deeply, or by keeping it free from weeds, merely skimming it over. As our opinion and yours appear coincident we trust our remarks in your columns will be acceptable. We would say extirpate the weeds decidedly, but as the season is far advanced it is advisable not to hoe the corn deeply now, especially as the drought has continued so long, and the land is in sufficient pulverised state. All possible care and circumspection should, however, on the part of master and man be exercised in uprooting all kinds of weed as they appear now with a common dock spud. Old mother Earth will be busy in nurturing her offsprings for a month to come, and the weeds will assuredly come in for the greatest share of nourishment from her resources, if we be not alive and watchful to our interests by uprooting them in due time, now in June before they have mastered our crops. It will be too late when the corn is in full ear to send in mischievous boys and girls, or even careful women or men, to repair the injury then. Some of our Wheat crops, sown in 2-feet rows, at less than 1 peck to the acre, which were dug up deeply between in November, February, and March, with Parkes' steel digging forks (admirably suited), are looking splendid, and are admired by all who see them, and which, with some other experimented corn of several acres extent, we respectfully submit to the notice of any agricultural friends who may feel disposed to come and see it. *Hardy & Son, Seed Growers, Maldon, Essex.*

Sparrow Clubs.—One cause of scarcity is the consumption of corn by birds and vermin; and we believe that the destruction of those depredators, to a certain extent at least, would confer a great boon on the country at large. We would spare all birds of prey, and would of course spare all innocent migratory birds, destined no doubt by Providence to visit our shores in due season to destroy swarming insects, living almost entirely on them, and taking their food upon the wing. To effect this purpose, it is proposed that landowners, farmers, gardeners, and other interested persons, should establish sparrow clubs in every parish or district, each member binding himself, under a forfeit, to produce a certain number of heads or tails of destructive birds or vermin to the secretary every week or month, until such time as they become nearly extinct. Or a subscription might be raised, enabling the secretary to give a sum for every certain description of bird, or for every dozen of eggs, from whatever source, &c. We will down with our sovereign at any time when our more spirited agricultural neighbours are ready to assist us in carrying the object into effect. The sooner some plan is devised for the destruction of these birds, if before harvest, the better; and none would have cause to rejoice more than the poor gleaners, for the safety of their small plots of corn and seeds in their cottage gardens and allotments, and their rightful share of corn in the stubbles. *Hardy & Son.*

Societies.

ROYAL AGRICULTURAL OF ENGLAND.

WEEKLY COUNCIL, *June* 20.—Mr. MILES, M.P., President, in the chair.

BUTTER-MAKING AND DAIRY MANAGEMENT.—The following communication was read from Mr. Thomas Scott, of Charing-cross:—

5, Charing Cross, May 30, 1855.

IT may not be unacceptable to the Council that I should give, in writing, the substance of the verbal statement which I made before the Weekly Meeting of the Society on the 2d inst. relative to the production of butter, and I shall now endeavour, briefly, to do so. My attention was especially directed to this subject two years ago by being appointed agent and receiver for the Audley estate in the county of Cork, where the production of butter is the mainstay both of landlords and tenants. I had previously for many years been intimately connected with some of the leading dairy counties, and much interested in this matter as resident agent on the estate of Lord de Tabley, in Cheshire—afterwards on that of the Duke of Argyll, in Kintyre—and latterly on the estates of Joseph Neild, Esq., M.P. in North Wilts and Somersetshire, all of which estates were dependent mainly on dairy produce for their incomes. I shall, therefore, address myself to the practical results of my experience, just as Professors Way and Hodges, and I may add, Mr. Horsfall, of Yorkshire, have done to the theoretical part of the subject, and the abstract principles connected with it. The question of the best mode of obtaining a large yield of butter from a certain number of cows, having been raised by the reading of a communication from Mr. Horsfall to Professor Way, before the Society on the 11th ult., I thought it a good opportunity to submit to the Council some incidents that had come under my own observation in connexion with dairying, and a few particulars relative to the trade in butter, especially with reference to Ireland. When we know that about 17,000 tons of butter are annually consumed in this metropolis alone, costing probably 100*l.* a ton, or 1,700,000*l.*, the immense importance is apparent of ascertaining the best process of realising the largest extract from our dairies. At the same time, this process, though ascertained, must occasionally be modified by local circumstances, such as the demand for skim or butter milk, and our ability to turn either of these important residues to advantage. In Ireland, for instance, the taste for skim milk is almost national, and it is extensively used in all private families, and in the numerous public establishments, such as barracks, workhouses, and gaols, that unfortunately exist there. In Cheshire, on the other hand, butter milk is universally consumed by the farmers' families and their servants and others. In the south of England, again, this is a beverage almost entirely avoided. Now every practical dairyman will readily perceive that the ability to sell skim milk in one place, and butter milk in another, or to feed calves profitably with the former, or pigs with the latter, must have an important share in forming a decision whether to churn from the whole milk, or from the cream alone, especially if the difference in the produce of butter between the two processes is as slight as I take it to be. Professor Trail makes out the following table from an experiment with four cows, in the month of June last year:—

1st.	Butter from scalded or Devonshire cream...	1.591 grains.
2d.	Do. from acid milk and cream	1.447 „
3d.	Do. from slightly sour whole milk ...	1.247 „
4th.	Do. from sweet cream	1.137 „
5th.	Do. from sweet milk and cream	None.

[Whether this table refers to the produce of equal quantities of milk taken in these different ways does not appear. Perhaps Mr. Scott will be kind enough to explain.]

The quality of all these samples was good and nearly equal. Mr. Dillon Croker, a good Irish authority, doubts the correctness of the above results, and thinks the produce from the cream alone has not been fully extracted. Even if it had, he shows by calculation that it is more profitable in his district by 8*s.* in the 7*l.*, or 5*l.* 14*s.* 3*d.* per cent. on the produce, to churn from cream alone, and to sell the skim milk, than to churn the milk and cream, and sell the butter milk. My inquiries lead me to believe that this holds good in the majority of cases; butter from cream alone is always richer in oil, and of better colour, than when made from whole milk, which produces more casein in the butter. We have equal discrepancies as to the best breed of cows for producing butter. Professor Trail made an experiment on this point, and found the Kerry cows to rank first, the Galloways second, and the Ayrshires third. Had the short-horns been included, I think they would have come in last. Of the Kerries' milk, 8⅘th quarts yielded 1 lb. of butter; of the Galloways', 9½ quarts; and of the Ayrshires', 10⅖th quarts; and their average daily produce of milk was 7¼, 6¼, and 9 quarts. I am inclined to think, after many trials during the last 13 years, that the old Irish and the Channel Island cows, crossed with the short-horns, make the two best butter producing animals, and are otherwise suitable for the dairy. The milking qualities in different animals of the same breed are, however, so various, that I am inclined to trust more to good shapes as indexes of milking qualities, than

to breed. Judgment and taste in selection are, therefore, more to be relied on. In Cheshire I had two cows, a short-horn and a cross-bred, of the same age and feeding together; the one gave 17 quarts of milk per day, which yielded only 18 ounces of butter; the other gave 10 quarts, which yielded 22 ounces, being more than double the ratio of the former. This is a suggestive subject for the physiologist. As a rule, *quantity* of milk should be obtained for cheese making, and *quality* for butter. Quality in milk arises partly from the breed of the cow, partly from her physiological character, and partly from the food she obtains. When much thin milk is obtained, the quality of butter made from it is never so good in taste, colour, or solidity, as when made from richer milk. This, I have found, arises from the excess of casein, and the greater difficulty of totally extracting it from the butter. What remains produces sourness, unless counteracted by extra salting. It also forms air cells, which originate rancidity and decay. I am now having a machine made to remedy the latter tendency. It is a hybrid between Clayton's piston clay-pugging machine and Ainslie's, with its rollers, being a screw piston in a circular cylinder. By the process I propose, the butter will be forced out in a continuous cake about an inch in thickness, and will pass over wooden rollers revolving in a frame containing the finest powdered salt, with a small mixture of fine sugar and nitre, when these are required to sweeten and preserve the butter. This cake of butter will be rolled up like a roll of calico after passing over these rollers, and will be again passed through the machine with a die on that will form it into rolls, squares, or any other shape required. When this is done, I find by experimental trials with clay and sand, that the salt will be completely amalgamated with the butter, and that it will be as hard and solid as a block of wood. I believe this process will make the most perfect mild, corned, or salted butter yet produced, and which will keep sweet for any length of time. I have no doubt it will be found of great value where a large quantity of butter is made. I am indebted to a suggestion of Professor Way for the original idea of this process of curing butter, and I shall willingly incur some expense to give it a fair trial. I propose designating it "Way's Butter-pugging and Salting Process." The Professor may thus be the means of supplying the two greatest desiderata to the perfect production of this important article, namely, scientific knowledge of its constituents and the food required to produce it, and mechanical contrivances for its proper manufacture. The most important point to be aimed at, and the one most easily attained, in our present state of knowledge, is the improvement of the quality of at least one-half of the butter made in England, and nine-tenths of that made in Ireland. An average cow will yield 196 lbs. of butter a year, and an increase of 1*d.* per pound in price is a gain of 16*s.* 4*d.* a head per annum, equal to about 10 per cent. on the whole produce. This, however, is much less than the increase in price which could be secured by a little more knowledge on the subject and by a little more pains in the several processes of management. I have attended to the returns of prices for the last 10 years, and in all our dairy county markets, namely, Cheshire, Gloucestershire, North Wilts, and others, they range 10 per cent. below the prices of Dutch and other foreign butter; and in the great butter producing county of Cork, extending over an area of 1,846,333 acres, the average prices are 20 to 25 per cent. below those obtained for the imported Dutch and Friesland butter. In several English and Irish counties, not strictly dairy counties, butter of the very finest quality is produced; but the quantity is so small that it has little influence on the aggregate returns from our home markets, and the result is that upwards of 50,000 cwt. of Irish butter is annually sent abroad at an inferior price, being quite unfit for home consumption, while at the same time we annually import, as we did last year, upwards of 400,000 cwt. of superior foreign butter, representing the produce of 220,000 cows, or all the cows in Scotland. Now, here are 22,500 tons of butter travelling backwards and forwards across the English Channel, while we might without cost improve the quality of what we export, and keep it at home, and by so extending our knowledge of the principles of butter making, increase our production and obviate the necessity of any importation at all. Though our dairy districts are not without examples of an exact adherence to spotless cleanliness, it is not so universal with us as with the Dutch and other continental dairy people. Nor are we so well able, as they generally are, to interpret the reasons for our different operations. They clothe their cows because they find they give more milk, and they know that they do so because the heat of the body is not uselessly dissipated in cold air: and that if it were so more food would be consumed to supply the carbon required to sustain the necessary animal heat of the body. They also know, by the light of science, why one kind of food produces an excess of cream, and consequently butter; and another casein, and consequently cheese; why poor food produces poor milk and goes back to the soil in the shape of poor manure; thus enabling milch cows so fed to impoverish the soil on which they graze, while cows getting food rich in the ingredients which milk contains give rich milk and also rich manure, the latter being then equivalent to, or in excess of, the substances extracted from the soil in grazing. Look also at the care with which the Continental Governments protect the consumers against inferior butter. In Friesland, all butter-firkin coopers are under Government inspectors, and are bound, under a fine of 25 guilders, or 2*l.* 1*s.* 8*d.*, to use specified wood; half these fines going to the informants, and half to the poor of the parish where such casks are made. All coopers must have their names on their casks, and the date of their make; and the inspector examines them and charges ½*d.* on each, and the Government brander then puts his mark upon them, and charges another ½*d.* No butter can be sold except in these casks, and specimens of all classes of authorised wood, and even of iron hoops, are kept at the district magistrate's. We have a well grounded objection to Government interference in this country, and the great agricultural interest is thought able to take care of itself. So, the returns from our cattle, corn, and dairy produce have become, to a great extent, dependent on the salesmen of Smithfield and elsewhere—on the corn factors of Mark Lane, and on the cheesemongers of London; and most people who have depended on any of these powerful interests, know how unsatisfactory the results usually are. Yet the English Government takes little or no cognisance of how any of our great agricultural marts are regulated. Private enterprise occasionally steps in, as in the case of the establishment of the "Chippenham monthly cheese and butter market," by Joseph Neeld, Esq., at a cost of upwards of 15,000*l.* Here we have an open market with ample accommodation, good regulations, and nominal charges. Dairy farmers in the surrounding districts are therefore no longer dependent on isolated individual purchasers; for here a hundred cheese factors and dealers compete for their produce, and I have seen 20,000*l.* worth of cheese change hands in a few hours. This shows how much a well regulated outlet for dairy produce is required and appreciated. I was several years on the managing committee, and was led to the conclusion, from data coming constantly under my observation, that it has considerably enhanced the value of all the dairy produce made within an area of 20 miles. A bill has lately been brought into parliament to regulate the numerous small local markets of Ireland, but its progress has been very tardy, and it may not be of much practical value when obtained. I will take one great trade combination in Ireland as an instance of how the agriculturists are handled, generally, in the sale of their produce; I allude to the "Cork Butter Market." At it there are annually sold about 340,000 firkins of butter, equal to 200,000 cwt., and worth upwards of 1,000,000*l.* Now, all this immense quantity of dairy produce is thought unworthy of any notice by the Government, and its sale is consequently left to a committee of Cork butter merchants, who naturally regulate the matter to suit their own interests. They appoint their own "inspectors" and "branders;" take off their own tare, namely, 3 lbs. per firkin of 70 lbs.; pay themselves a commission for buying the farmers' butter; combine and fix their own weekly prices, and are, as a matter of course, all very rich, several being members of Parliament. This, I think, accounts for the Cork butter being the lowest priced in the three kingdoms, although the pastures are nearly all on limestone, and the herbage of the best butter-making quality. About one-third of the butter brought to Cork is put into iron-hooped firkins and sent abroad, being unfit for home consumption. All butter sold in the local and more independent markets in the adjoining counties of Carlow and Limerick brings 1*d.* per lb. more than if sold in Cork under the thraldom of the "Butter Weigh House Committee." Tenpence per lb. is now about the price for first-class brands. I herewith send, for the inspection of the Council, six samples of butter made by my directions on the Audley estate, in the county of Cork. This butter is the produce of cows of the native Irish breed, fed on natural pastures and Italian Rye-grass, and is made at the rate of 14 oz. per quart of cream, the cream being obtained at the rate of one quart from nine quarts of milk. The churn used is Anthony's patent. Mr. Horsfall, it will be shown further on, obtains only ⅔ of a quart of cream from 10 1-7th quarts of milk. By the subjoined account, copied from the books of the "Weigh House Committee" last month, you will perceive that the farmers who send their produce to its care were charged, for the year ending the 10th March last, the large sum of 5128*l.* 16*s.* 8*d.*, which is made up thus:—

Produce of butter scrapings	£1427	2	6
Fees for butter inspection from farmers ...	3291	5	5
Do. for cask inspection from do. ...	284	9	11
Fines	125	18	10
Total	£5128	16	8

It is almost needless to say that this powerful organisation is ruinous to the farmers who are under its control, and is much and loudly complained of; but so, I fear, it must remain, until remodelled or superseded by a higher hand. It is the interest of all dairy farmers to study more carefully than they do at present how to improve the quality of their butter. I am sorry to have to state my belief that few know anything at all of the principles that ought to regulate their several processes. I say this reluctantly but confidently, after having, for the last 10 years, as a resident agent, been in immediate contact with at least 500 rent-paying occupiers of this class. The first of the following tables shows the results from feeding, in an experiment by Mr. Cunningham, the manager of the Munster model farm, under the Board of National Education in Ireland; and the second the results in connexion with an experiment made under my directions on the Audley estate, in the county of Cork:—

* Fresh cow put in.

[Note.—These are not calculated to show a comparative result, but only the product arising from good keep and careful management. It is considerably in excess of the ordinary tenants' produce in the same district.]

The most important points to be attended to, then, are these, a good breed of cows; proper food and abundance of it. Let the temperature of dairies always be regulated by a thermometer, and kept at from 50° to 60°, with proper ventilation, that the cream may not become musty; and let them always be thatched, or, if slated, coated with lime-wash, as Mr. Mechi's buildings are, that the roofs may radiate and not absorb the sun's rays. Skim the cream off the milk in about 36 hours in summer, and 48 in winter, after milking, and churn in 48 hours afterwards; put the cream into the churn at a temperature of 50°, and after the butter is formed let the whole remain in the churn an hour to cool. When wrought up, either for sale fresh, or for putting in kegs and corning, let the hands of the person employed be continually dipped in cold spring water, and let the whole of the liquid be extracted and the residue left as compact as a deal board. Use no colouring—the fine Dutch and Epping butters of the London market having no saffron, annatto, or Carrot juice in them; avoid much and coarse salt—compression and solidity will keep out the air, and preserve corned butter; and the weight gained from adding salt at 1*d.* per lb. is doubly counteracted by the reduction in price. Neither apply hot water in making up—it firms the butter but impoverishes it of its best qualities, and spoils the flavour. A little more salt is, however, required in summer than in winter. Keep clear of turf smoke and Potatoes, both of which readily communicate a bad flavour to butter, which is much complained of in the Cork market; use white wood, and not brown firkins, and when the butter is packed, weigh it down with a half cwt. for a few hours before heading up. If these points are attended to, any one in this country will at once succeed in rivalling the best Dutch or Friesland butter. To increase the quantity of butter cows must be soiled, and fed on more nutritive food than at present; they must never have to labour for their food. They must also be kept warm, and at an equal and well regulated temperature. Here, again, an eighteenpenny thermometer must be hung up. I have also found an increase of milk to arise from giving cows wooden instead of stone or brick beds to lie upon. I tested this carefully on Mr. Neeld's estate, where they may still be seen in use. Never keep old cows—their milk is thin and poor; strip the cows thoroughly each time they are milked, as the last pint contains more butter than the first quart. A tenant of Lord de Tabley's, who kept 45 cows only, and died a few years ago worth 30,000*l.*, often told me that he had made half his fortune by daily seeing to this point for 30 years. Churn early in the morning, say at 4 o'clock, using a good churn and never commencing with a bad one. If the cows are allowed to graze, change the pasture each time they are milked, as I have seen this produce the best results. If they are housed let them go loose if possible. A good model building on this principle for 100 cows, designed by Mr. Godwin, the editor of the *Builder*, may be seen at Wall's Court farm, near Bristol, belonging to his Grace the Duke of Beaufort, and occupied by Mr. Thomas Proctor, who, along with his Grace's agent, Mr. Thompson, of Badminton, personally inspected many of the best homesteads in England, before adopting the plan. These, then, I believe to be the most essential requisites to ensure a profitable return from the dairy. Relative to Mr. Horsfall's particular practice, I fear its pecuniary value to dairy farmers will be found on investigation to bear no proportion to our original expectations. His return of 25 ounces of butter from one quart of cream appears at first sight something wonderful; but it proves nothing. The proportion which the butter produced bears to the whole milk is the only result of practical value that we have to look to. By analysing his statements it will be seen that this is as 1 lb. of butter to 10½ quarts of whole milk, and as shown by the following 17 returns, the produce of Mr. Horsfall's does not exceed an average.

Trials.	Breed of Cows.	Milk required to produce 1 lb. of butter.	Cream from 10 quarts of milk.	Butter from 10 quarts of milk.

	+9 ...	96.93	11.47	140.18
	Average ...	10.77	1.27	15.66
Horsfall's	Yorkshire ...	10.14	0.64	15.78

The next question is, does his system of feeding and his other appliances produce more than an average quantity of milk. On the contrary, the milk from which Mr. Horsfall attained the above extract of butter is only yielded at the ordinary rate of 10 quarts per cow per day. There then only remains the extra richness of the manure to be considered. We know from experience, in connection with oil-cake fed cattle, that this is considerable, but whether it is sufficient to compensate him for his liberal feeding must to some extent remain a matter of opinion, at all events it appears to me to be the only consideration that can be held out to induce others to adopt his expensive system of treatment. The residue of buttermilk obtained by Mr. Horsfall also appears unusually small, being only 30 per cent. of the cream churned; whereas the usual residue is fully 50 per cent., and the following experiments by Mr. Dillon Croker, in the county of Cork, and Mr. John Williams, an experienced dairy manager on a large scale in the same county, show an average of 60¾ per cent.

	Cream churned.	Produce in Butter.	Produce in Buttermilk
Mr. Croker's experiment	128 qts.	112 lbs.	70 qts.
Mr. Williams's	160 „	136 „	104½ „
	÷2 288	248	174½
	144	124	87¼ = 60¾ per cent.

This would lead us to believe that Mr. Horsfall's butter is not so well worked and free from butter milk as it should be, and consequently not of the first quality. We ought to have an average sample of his butter before us, together with the price obtained for it during the last two months, to enable us to judge of its quality and value. If his butter were extracted from ordinary creams, which I think the comparative table given above shows it is not, the result would overthrow the reliability of all the Society's reported trials in connection with competing churns during the last and previous years. The best churns and richest creams were used on those occasions, but in no instance did the extract reach beyond 70 per cent. of Mr. Horsfall's. When the Board of Agriculture was in existence, Mr. Cramp, the keeper of the House of Correction at Lewes, reported to it the average annual produce of a cow he kept for eight years, at 41*l.* 8*s.* 3*d.*, arising from his mode of treatment; and this return was confirmed on personal inquiry by the Earl of Chichester. The result was obtained by frequent and liberal feeding, which was minutely detailed and laid before the public; but this "high farming" in the dairy has not been found suitable for general adoption. Other isolated instances of excessive produce could be enumerated. For instance, I was aware of two cows in Cheshire possessing great milking qualities, and obtaining highly nutritious food, which gave for several consecutive months; the one, 40 quarts of milk per day, yielding 4½ quarts of cream, and 2⅚th lbs. of butter; the other, 36 quarts of milk, yielding 4½ quarts of cream, and 2⅔th lbs. of butter. These cases, however, are entirely exceptional. The average produce from a first-rate cow, well kept throughout a season of say nine months, seldom exceeds 2700 quarts of milk, yielding 300 quarts of cream, or 1 quart of cream for 9 quarts whole milk, and 26¼ lbs. of butter; which is at the rate of 14 ounces of butter from 9 quarts of milk, or 1 quart of cream; and which is little more than one-half the weight of butter obtained by Mr. Horsfall from an equal quantity of cream. To show that the breed of cows, as well as their food, has a good deal to do with the yield and constituents of milk, I may mention that on an estate in the south of Scotland under my management some years ago, there were two farms in hand, which were stocked with a breed of Ayrshire cows, devoted to cheese making. Not thinking it profitable to make cheese, a herd of 45 Alderney Cows was substituted for them on one farm, and butter made from the whole milk, under the direction of an experienced Ayrshire dairy maid, and after three years' experience it was found that these animals produced more butter off the same land than their predecessors

but when an attempt was made to convert their milk into cheese, the weight of produce was lamentably short of that obtained from the Ayrshires. Again, in the county of Cork, especially on the fine limestone land around the city of Cork, the butter extracted from a certain quantity of milk far exceeds that obtained from an equal quantity on the alluvial pastures in Cheshire: but when cheese is attempted in the former locality, as it has often been, and is now being done at Castle Townsend by Mr. Chambers, a Scotch farmer, it falls far short of the quantity obtained from a cow in Cheshire. The quality is also inferior to the English cheese. It thus appears that both the breed of cattle and the food they obtain have a special influence on the quantity and quality of produce, sufficient, I think, to induce us to study more closely than we now do the adaptation of both to the general or special purposes of our farm and dairy management. No truer remark could be made than that contained in the report of the Farming of Cheshire in 1803, by Dr. Holland. He says: "Many attempts have been made to imitate Cheshire cheese in other counties, but never successfully. Some brought their kine from Cheshire, others their dairy-women, but it doth appear they should have brought the land also." About seven years ago, the late Mr. Leigh, of Delmont, in Cheshire, tried to bring this knowledge more under our control, and carried out a system of weighing a large number of cows, weekly, on the principle Mr. Horsfall has now adopted: but in consequence of his death, the undertaking, I think, was abandoned, and I am not fully aware to what result it led, as far as it went. This is to be regretted, as it is only through such detailed researches that we can hope to acquire an exact knowledge of the means necessary to guide us to fixed and accurate results. We know, for instance, that bone-dust applied to pasture land in Cheshire means an increase of cheese, and that coral sand in Cork, is, in reality, butter; but when we learn from Professor Way the fact that the food most rich in the materials composing the animal products and plants, to the production of which it is specially applied, does not produce in them a corresponding increase of their essential ingredients, we see that chemistry does not yet furnish us with fixed and uniform rules for our guidance; thus Linseed and other highly nitrogenous substances, when given to milch cows, produce a greater amount of casein than they do of oleaginous material or butter, which is the reverse of what chemistry would lead us to expect. Again, the phosphates when applied to the soil, increase the produce of Turnips far beyond that of Wheat, although the latter is found to contain much the largest per centage of phosphates. It is these exceptions to the conclusions arrived at by the inductive reasoning of the analytic chemists that require them to refer occasionally for information to practical experience, and which has rendered them unable, up to the present time, to remedy Clover sickness by applying to the soil the ingredients necessary to build up that plant. Another anomaly is, that of some poor pastures producing very rich milk: When this is the case, we are now well aware that they must rapidly become poorer, as most of the nutritive properties of the food are absorbed and carried off in the milk, and the excrement becomes proportionally devoid of all restorative power. The reverse of this produce is, however, more common; for instance, on the great Ballynahinch estate, Connemara, probably the poorest in herbage in the three kingdoms, an experiment was lately made for me, when 70 quarts of cream yielded only 31½ lbs. of butter, equal to 7½ ozs. per quart of cream. Having been favoured by the Irish Executive with the whole of the Reports to the Commissioners of National Education in Ireland, on the 33 model and 96 workhouse and other agricultural schools in that country, I cannot fail to observe that they exemplify an amount of careful and quiet investigation, especially into dairy processes, which must lead to useful results, and which ought to have a parallel in England, unless we are willing to allow the Irish people to outstrip us in scientific agricultural education. The Irish occupier's great desideratum I have already stated, verbally, to be the want of suitable dairy accommodation; and few cows being held by one owner is another serious drawback, as it necessitates the cream being kept too long before the quantity necessary for a churning is made up. I would earnestly urge upon Irish landowners, whose estates are occupied by a numerous small tenantry, the advisableness of adopting means to remedy drawbacks so seriously affecting their tenants' returns from the land they occupy, as well as their own. I can assure them, from personal experience of estates in Ireland with which I am professionally connected, that there would be no unwillingness on the part of the tenants to avail themselves of, and to pay for, any real advantages or improvements placed within their reach. In England the appliances on dairy farms are generally liberal, but few of them are constructed on sound scientific principles, and few of the occupiers are at all imbued with a due appreciation of what men of science and research are doing for them. *Thos. Scott.*

Professor Way's lecture on Fish as Manure, intended to be delivered on the 27th of June, is postponed to the 18th of July, in consequence of Professor Way being subpœnaed to give evidence in a court of law next week.

Mean daily temperature during the last four months—viz., from the 1st January to the 31st April, was as follows:—England, 37.15; Ireland, 39.29; and Scotland, 37.06. Daily Mean for the United Kingdom, 37.82.
—*Allnutt's Irish Land Schedule.*

Profits of Poultry Keeping.—We noticed some time since the manner in which a gentleman who occupies a leading position amongst the magistracy of this county, was bringing to the test, by careful management, and the keeping of a correct financial account, the profits that may be made from poultry. His purpose was not the breeding of prize birds for a show day, often, perhaps, done at a considerable pecuniary loss, but to illustrate how this too-much neglected branch of rural economy might be improved and extended, to the gain of the farmer, if more general attention were paid to it. We have now the following letter, containing the balance-sheet for the year, with an explanatory statement, and we publish them, believing they will be read with interest at the fireside of the farm-house:—

COST OF FOOD AND REARING, JAN. 1 to DEC. 31, 1854.
Fowls of all Sizes, average Sixty.

	£	s.	d.
Food—being Barley (in grain), barleymeal, oatmeal grits, Lettuce leaves, Swede Turnips, rice and milk, and liver; all as occasion required, and without stint	11	2	6
Paid for care and rearing them	2	9	0
	13	11	6
Balance	5	6	3
	£18	17	9

PRODUCE FOR THE YEAR, JAN. 1 TO DEC. 31, 1854.
Fowls of all Sizes, average Sixty.

		£	s.	d.
Dorkings' eggs	593			
Cochin ditto	700			
At 1*d.* each	1293	5	7	9
Pullets killed	62			
Pullets, ready for table	28			
At 3*s.* each	90	13	10	0
		£18	17	9

N.B.—All the pullets weighed 3 lbs., plucked and trussed for the table.

This account should be attended with some observations, so that it may be understood. In the first place the cost of food only may be taken at say 12*l.* for the year; making the calculation more easy—viz., 1*l.* per month; not exorbitant for the keep of 60 birds, and considering the excessive price of Barley, 4*s.* 6*d.* and 5*s.* per bushel, all the time, and everything in proportion. This, then, gives 4*d.* as the cost per fowl, great and small; thus, the keep of a pullet five months, when they are large enough to kill, would average 1*s.* 8*d.* per fowl, bird for bird. Then, if the farmer or cottager bred them himself, the 2*l.* 9*s.* paid others for care and rearing makes the balance 7*l.* 15*s.* 3*d.* The mixture in the breed between Cochin and Dorking, which, for distinction sake, I have called "Codors," has improved both in "flavour" and "form" for the table. As to the eggs, there is no month in the year when the Cochins did not lay; in November and December last the Dorkings laid no eggs, but the ten breeding Cochins, in those months, laid 76 eggs. The sole object of the present experiment was to try what might be done by cultivating these two sorts as a matter of useful economy, not to breed monsters; the medium size in animals is really the best, as in fruit, as every good gardener knows. My object was usefulness, and, on the whole, I am well satisfied. *Chelmsford Chronicle.*

Calendar of Operations.

JUNE.

BORDER OF THE FENS, *June* 16.—"The gentle rain from heaven" has come at last so abundantly as to gladden the hearts of all persons with a thin plant of Wheat and scanty pastures, quite turning the scale against the "highlanders," who begin already to sound a note of alarm at the prospect of Wheat and Barley being "too thick upon the land," the former of which has in some cases been "topped" on account of its exuberant growth; and, in truth, vegetation of all kinds has started towards maturity with a celerity perfectly marvellous; the Wheat that but yesterday was scarcely distinguishable in height from spring corn, with weeds inconsiderable, is to-day as it were spindling 3 feet high, with the weeds rank and conspicuous, defying the abortive effects of women and children during the wet weather to stay their progress, and scarcely to diminish their number. Hardly had the Hariff, Thistles, and Poppies been deemed by the watchful farmer big enough to pull up, when they passed him at a hand gallop, and he must now let too many of them remain a legacy for future vigilance, or have the stems of his Wheat trodden down and broken; the corn, however, must be gone over once besides the hoeing, where necessary, if thick and forward. Children under a kind and able gangman will clear more weeds and do less injury than women, who are seldom collected in sufficient numbers to go over a large field within any reasonable time. We heard this day of several ears of Wheat being seen in a field near Stamford, and I have found some in this neighbourhood ready to burst forth; but as a postcript to this description of the extraordinary change which has taken place, we regret to add that in the Fens many pieces of Wheat and Oats still remain yellow and abortive, and cannot recover from the mischief occasioned by the repeated visitations of wind and frost, so that the gross produce of the Fen districts will be seriously diminished by so many failing crops. The rain has been as great a boon to the green crop as to the corn. Potatoes, Carrots, and Mangold Wurzel are going on splendidly, and the Turnips are everywhere springing up strong and healthy. Clover seems to make amends for its long retardation, and Vetches cannot be cut or fed off fast enough. We need hardly add that Grass is growing as it has not grown for years. The only thing that seems to keep pace with it is the advance in the prices of store stock by cattle dealers, but even this may be limited, and we learn that at this day's market many lamb hogs and young beasts have returned unsold, either because too great figures were put upon them, or because the abundance of keep led the holders of them to expect still further advances another day. The spring has not been propitious to the growth of wool, and though we are a fortnight later in shearing than last year, we are inclined to suspect that we might have waited another week or two with advantage. Some persons who have clipped early, have lost several sheep, and the wool seems higher than usual. It behoves shepherds about this time to exercise more than usual care in counting ewes and lambs, as after losing their wool the mothers are not always recognised by the lambs, while they are apt to stray and be lost. *J. W., Peterborough.*

Notices to Correspondents.

SOCIETY OF ARTS: *Cor.* We shall have an opportunity of consulting its journal next week.

MANGOLD WURZEL: *J B M.* They say that wire worm may be checked by trampling and rolling the ground. If so, it is possible, but not probable, that your Mangold might to some extent be saved by treading round each bunch of plants. We fear if they are attacked much that they are beyond help.

SALT, &c.: *Three Years' Subscriber.* If sown in wet weather, a cwt. per acre. You may sow Clover and Rye-grass land a week afterwards without their being hurt. On a sheep-house see what is said of Mr. Kennedy's in the article on Italian Rye-grass some w eks ago. We cannot give estimates of cost.

THE VETCH: *Constant Reader.* The plant is correctly named Vetch. In Scotland it is called Tare.

WATERPROOF PATHS.
BARN AND CATTLE SHED FLOORS.

THOSE who would enjoy their Gardens during the winter months should construct their walks of PORTLAND CEMENT CONCRETE, which are formed thus:—Screen the gravel of which the path is at present made from the loam which is mixed with it, and to every part of clean gravel add one of sharp river sand. To five parts of such equal mixture add one of Portland Cement, and incorporate the whole well in the dry state before applying the water. It may then be laid on 2 inches thick. Any labourer can mix and spread it. No tool is required beyond the spade, and in 48 hours it becomes as hard as a rock. Vegetation cannot grow through or upon it, and it resists the action of the severest frost. It is necessary, as water does not soak through it, to give a fall from the middle of the path towards the sides.

The same preparation makes first-rate paving for BARNS, CATTLE-SHEDS, FARM-YARDS, and all other situations where a clean, hard bottom is a desideratum. May be laid in winter equally well as in summer.

Manufacturers of the Cement, J. B. WHITE & BROTHERS, Milbank Street, Westminster.

RICHMOND & CHANDLER'S PATENT CHAFF-CUTTING MACHINE.

All the various modern Implements of Agriculture manufactured on the most scientific and improved principles, suitable for home use and exportation.—Address, RICHMOND & CHANDLER, Salford, Manchester; and 32, South John Street, Liverpool.
☞ CATALOGUES GRATIS.

PARKES' STEEL DIGGING FORKS & DRAINING TOOLS.

MESSRS. BURGESS AND KEY, as Mr. PARKES' Wholesale Agents for England, have always in stock a large assortment. These Forks and Tools are now in use by upwards of 1000 of the Nobility and Farmers, members of the Royal Agricultural Society, who pronounce them to be the best ever invented, and to facilitate labour at least 20 per cent. Price Lists sent free on application, and Illustrated Catalogue of the best Farm Implements, on receipt of eight postage stamps.

IMPROVED MOWING AND ROLLING MACHINE.

ALEXANDER SHANKS AND SON, Arbroath, Forfarshire, Inventors and Sole Manufacturers, respectfully solicit the attention of the Nobility, Gentry, and Gardeners to this Improved Machine for Mowing and Rolling Lawns. The Machine is in operation in the Royal Gardens at Windsor Palace, Buckingham Palace, and at Osborne, in the Botanical Gardens at Kew, Regent's Park, Manchester, Sheffield, &c.; at Blenheim Palace, Trentham, Cleveden, Elvaston, Broadlands, Woburn Abbey, Clumber, Lilleshall, Castle Howard, Shrubland, Eridge Castle, Enville Hall, Tiptree Hall, Chatsworth, and in many other of the principal gardens in the kingdom as well as in the United States, British America, and on the Continent, where its merits have been fully proved, and its success established.

The machine is made to cut the breadth of 42, 30, 20, and 15 inches respectively, is exceedingly durable, easily managed, and adjusted to cut to the length required. The execution of the work is far superior to what may be attained by the most skilful mower, while at the same time a great saving of labour is effected, and the turf much improved. By the largest machine a Scotch acre may be mowed, rolled, and the Grass collected in one hour.

A. S. and SON have much pleasure in stating that they have made considerable improvements in their 15-inch or hand machine this year, by which the draught is considerably lessened. This machine combines all the merits and advantages of the larger machines with firm and secure construction, and is admirably adapted for borders and for lawns of no great extent.

ALEXANDER SHANKS and SON also respectfully solicit notice to "Fleming's Weeding or Salting Machine" for destroying weeds in gravel walks, court-yards, drives, &c. This machine is now in operation in many parts of England, where it has given ample satisfaction as the best and most economical means of thoroughly keeping down weeds or Moss.

Further particulars, with testimonials and prices, may be had on application.

GLASS FOR CONSERVATORIES, GREENHOUSES, PIT FRAMES, ETC.

JAMES PHILLIPS AND Co. have the pleasure to hand their present reduced prices of Glass for Cash:—

SHEET SQUARES.
In Boxes of 100 feet.

Established more than 100 years.

HOSE PIPING.
TO ENGINEERS, AGRICULTURISTS, GARDENERS, SHIP CHANDLERS, AND FIRE BRIGADES.

WAITHMAN'S PATENT FLAX TUBING (1 in. to 3 inches in diameter) will sustain a greater pressure, is lighter, less bulky, will wear longer, and is about 60 per cent. cheaper than the leather hose pipe. Manufactured only by WAITHMAN & Co., Bentham, Lancaster.

INCHES IN DIAMETER AND PRICE PER YARD.—¾, 11d.; 1, 1s. 1d.; 1¼, 1s. 3d.; 1½, 1s. 5d.; 1¾, 1s. 7d.; 2, 1s. 9d.; 2¼, 2s.; 2½, 2s. 3d.; 2¾, 2s. 6d.; 3, 2s. 9d.

Testimonial from Mr. Wright, Lancaster.—I beg to inform you that I yesterday tested your piece of 2½ inch Patent Flax Tubing, connected with the Lancaster Waterworks, in the presence of the Mayor, Mr. Rawlinson, Government Inspector, Professor Owen, &c. The column of water at which the tubing was tried was equal to 340 feet in height, or about 150 lbs. on the square inch, and I have pleasure in stating that the hose sustained this pressure most admirably.

Testimonial of Captain Martin, of the Great Britain Steam Ship.—I have much pleasure in being able to tell you that your hose, supplied to the Great Britain and other ships, is well worth the attention of shipowners. It gives us great satisfaction.

Testimonial from Fairbairn & Co., of Leeds.—We have tested your hose, 2½ inch in diameter, with the pressure of the Leeds Waterworks, and found it highly satisfactory.

WARNER'S SWING WATER-BARROW
(TO HOLD THIRTY GALLONS)

Is intended for all large Establishments where much watering is done by the watering-pot. By its use much time and labour of the Gardener are saved, particularly where the Tank, Pond, or Pump, is at a distance from the garden. May be obtained of any Ironmonger in town or country for 3l. 3s.

Manufactured by
JOHN WARNER & SONS, 8, Crescent, Jewin Street, London.

(Fig. 1.)

(Fig. 2.)

J. TYLOR AND SON'S BARROW GARDEN ENGINE (Fig. 1), in best well painted oak tub, fitted with improved Pump, universal joint, and registered Spreader, which answers the purpose of the separate rose fan and jet.

No. 2	„	15	„	„	45	„ ...	5 10
No. 3	„	28	„	„	45	„ ...	6 18

J. TYLOR & SON'S BARROW GARDEN ENGINE (Fig. 2), in strong tinned iron tub, well painted inside and outside, with improved Pump, universal joint, and registered Spreader, which answers the purpose of the separate rose fan and jet.

No. 10	holds	8	gallons,	throws	25	feet high ...	£2 15
No. 13	„	12	„	„	30	„ ...	3 5
No. 11	„	16	„	„	40	„ ...	4 0
No. 12	„	24	„	„	45	„ ...	5 0
No. 14	„	30	„	„	45	„ ...	5 18

A large assortment of every description of Garden Syringes, Pail Engines, Conservatory Pumps, &c., kept in Stock.

No. 1, Plain Syringe, with rose and jet, diameter of barrel, 1½ inch, 14s. 3d.; No. 2, do., diameter of barrel, 1⅜ inch, 12s.; No. 3, do., diameter of barrel, 1⅛ inch, 10s. 6d.

READ'S SYRINGE, with two roses and one jet, 19s.

J. TYLOR & SON'S Horticultural Apparatus may be obtained at these prices from any respectable Ironmonger or Seedsman in town or country, through whom alone they will be supplied, and of whom Drawings and Prices may be had.

N.B. Cost of carriage, &c., not included in these prices.

J. TYLOR & SON'S Manufactory, Warwick Lane, Newgate Street, London.

J. TYLOR AND SON'S REGISTERED GARDEN SYRINGE.—Small size, for Amateur use, **21s.** each. Large size, for Gardeners' use, **25s.** each.

Extra for Telescope Tube as shown in engraving for watering plants on stands at a height of 8 feet, so that any quantity of water can be deposited in the pot without wetting the leaves, 10s.

By a simple arrangement this Syringe is rendered more effective than any portable Conservatory or Garden Pump ever offered to the public. It is equally adapted for Garden or Conservatory use, and is capable of discharging twice as much water in a given time as any other Syringe now in use. The arrangement consists in attaching a small flexible suction tube to the barrel of the Syringe, through which it is filled with water at every discharge of the previous contents. By this means the Syringe is always charged, and the pull-up stroke of the piston rendered perfectly easy, it having, indeed, no work to do, the barrel being previously full of water. Being thus made self-supplying, a great saving of labour is effected; and the necessity of stooping to fill the syringe at every discharge being done away with, the direction of the water can be maintained for any length of time. It is perfectly cleanly in its action, as it is not possible for any water to get on the outside of the barrel, which is a well-known inconvenience attendant on the use of every other Syringe. Its construction is perfectly simple, and cannot get out of order; the ground in ball valves and fittings used for filling all other patent Syringes being entirely superseded. To be had of any respectable Ironmonger or Seedsman in town or country.

J. TYLOR & SONS, Manufacturers of Horticultural Apparatus Warwick Lane, Newgate Street, London.

N.B. These prices do not include carriage, package, or expense of delivery in the country.

FOR WATERING GARDENS.

HANCOCK'S IMPROVED VULCANISED INDIA-RUBBER HOSE AND TUBING is now manufactured especially for the above purpose; is of greater durability than any other description of Hose: is capable of resisting great pressure, and made suitable for attaching to the mains of water-works, or to tanks of high elevations.

WATERING HOSE fitted up with the necessary *brass jointed stop-cocks, branches,* and *spreaders complete.*

VULCANISED INDIA-RUBBER SUCTION PIPES, made any length or size for Pumps or Garden Engines.

VULCANISED RUBBER WASHERS, and also in Sheet, any thickness, for all kinds of steam and water joints, or made any size or figure to order.

All communications and orders punctually attended to, addressed to the Manufactory, JAS. LYNE HANCOCK, Goswell Road, London.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

E. DENCH, PATENT HOTHOUSE WORKS, King's Road, CHELSEA. Printed Price Lists sent on application.

HORTICULTURAL WORKS AND HOT-WATER APPARATUS MANUFACTORY.
KENSAL GREEN, HARROW ROAD, LONDON.

JOHN TAYLOR AND SON beg to call the attention of the nobility and gentry to the very superior manner in which they Erect all kinds of Conservatories, Vineries, Greenhouses, &c., combining every improvement with elegance of design, and durability of materials and workmanship.

Their VENTILATING APPARATUS for the Fronts and Roofs of Houses has given the highest satisfaction. Churches, Chapels, Schools, Entrance Halls, Public Buildings, &c., heated with Hot-Water Apparatus in a most economical and efficient manner. J. T. & SON have great pleasure in referring to numbers of the nobility and gentry by whom they are extensively engaged.

HORTICULTURE IN ALL ITS BRANCHES.

JOHN WEEKS & Co., King's Road, Chelsea,

HOTHOUSE BUILDERS.

THE NOBILITY AND GENTRY about to erect Horticultural Buildings, or fix Hot-water Apparatus, will find at our Horticultural Establishment and Hothouse Works, King's Road, Chelsea, an extensive variety of Hothouses, Greenhouses, Conservatories, Pits, &c., erected, and in full operation, combining all modern improvements, so that a lady or gentleman can select the description of House best adapted for every required purpose.

The HOT-WATER APPARATUS, which passes through all the Houses and Pits, affording both top and bottom heat, is in constant operation and particularly worthy of attention.

Many of the Houses and Pits are of wide and lofty dimensions and together equal in length 1000 feet. They are all effectually heated by *one boiler*, which, during the severe winter months does not cost in labour and fuel more than 3s. 8d. per day, and the apparatus is so arranged that each House or Pit may be heated separately and to the required temperature. The splendid collections of Stove and Greenhouse Plants are also in the highest state of cultivation, and for sale at very low prices. Also a fine collection of strong Grape Vines in pots, from eyes, all the best sorts.

Plans, Models, and Estimates of Horticultural Buildings: also Catalogues of Plants, Vines, Seeds, &c., forwarded on application to JOHN WEEKS & Co., King's Road, Chelsea, London.

TRELOAR'S COCOA-NUT FIBRE MANUFACTURES, consisting of MATTING, MATS, MATTRESSES, BRUSHES, NETTING, HORSE-HAIR, and BRISTLE SUBSTITUTE, are distinguished for superiority and excellency of workmanship, combined with moderate prices. Prize Medal both in England and America at the Exhibition of all Nations.

T. TRELOAR, Cocoa-nut Fibre Manufacturer, 42, Ludgate Hill, London.

TANNED NETTING, for the protection of Fruit Trees from frost, blight, and birds, and for the security of fresh sown seeds, either in Gardens or Fields, at 1d. per square yard; 200 yards, 14s.; 500 yards, 30s.; 1000 yards, 50s. Scrim Canvas, for Wall Fruit.—At EDGINGTON and Co.'s, Rick Cloth, Tent, and Waterproof Cloth Manufacturers, 17, Smithfield Bars, City, and Old Kent Road, Southwark; Emigrant Outfitters, Ship Chandlers, and Export Merchants, Brunswick Street, near the East India Export Dock, Blackwall.

GALVANISED WIRE GAME NETTING.—7d. PER YARD, 2 FEET WIDE.

			Galvanised.	Japanned iron.
2-inch mesh, light, 24 inches wide		...	7d. per yd.	5d. per yd.
2-inch	„ strong	„ ...	9 „	6½ „

1⅝-inch	„ strong	„ ...	10 „	8 „
1⅝-inch	„ extra strong	„ ...	14 „	11 „

All the above can be made any width at proportionate prices. If the upper half is a coarse mesh, it will reduce the prices one-fourth. Galvanised Sparrow-proof Netting for Pheasantries, 3d. per square foot. Patterns forwarded post free.

Manufactured by BARNARD & BISHOP, Market Place, Norwich, and delivered free of expense in London, Peterborough, Hull, or Newcastle.

CAUTION.

PARKES' STEEL DIGGING FORKS AND DRAINING TOOLS.

Whereas very inferior descriptions of Steel Digging Forks are now manufactured and sold, and I have been informed that purchasers of the same have believed them to be the same as those manufactured by me, and to which the Royal Agricultural Society and numerous Agricultural Societies' prizes have been awarded, the proprietors respectfully inform the public that every Fork manufactured by me is stamped with my trade mark "J. P.," and that Messrs. Jenkins & Key, of No. 103, Newgate Street, London, are my sole Wholesale Agents, and I have authorised them to replace to the purchaser every Fork of my manufacture found defective; they will also on application send Wholesale and Retail Price Lists, &c., post free. FRANCIS PARKES & Co.

HAY-MAKING MACHINES.—The ROYAL AGRICULTURAL SOCIETY'S PRIZE MACHINES are supplied by WM. DRAY & Co., Swan Lane, Upper Thames Street, London.

INGLIS AND CHISHOLM, Charles Street, Garratt, Manchester, make STEAM ENGINES for Agricultural and other purposes of the best quality at a reasonable price.—Address Inglis & Chisholm, Charles Street, Garratt, Manchester.

TO LAND AGENTS, STEWARDS, GARDENERS, ETC.

MITCHELL'S ANTISEPTIC MINERAL BLACK PAINT is the best and cheapest preservative of Park Fencing, Barns, Out-houses, and all outside Wood and Iron Work. Sold ready for use, price 17*s.* 6*d.* per cwt. Allowance on large orders. Used largely now and for many years past by the West India Dock Company for Fencing, Lockgates, Barges, &c.
Manufactory: Kennington Lane, Lambeth.

HOW TO KILL RATS, MICE, AND MOLES BY HUNDREDS.—A Method will be forwarded with instructions for 30 postage stamps, which will destroy the above vermin quickly and without trouble. 1000 acres may be cleared for a few shillings.
GILBERT DYSON, Hoo, Rochester.

"FRIGI DOMO."—Patronised by her Majesty the Queen, the Duke of Northumberland for Syon House, His Grace the Duke of Devonshire for Chiswick Gardens, Professor Lindley for the Horticultural Society, Sir Joseph Paxton for the Crystal Palace, Royal Zoological Society, Mrs. Lawrence, of Ealing Park, and — Collier, Esq., of Dartford.

PROTECTION FROM MORNING FROST.

"FRIGI DOMO," a Canvas made of patent prepared Hair and Wool, a perfect non-conductor of Heat and Cold, keeping, wherever it is applied, a fixed temperature. It is adapted for all horticultural and floricultural purposes, for preserving Fruits and Flowers from the scorching rays of the sun, from wind, from attacks of insects and from morning frosts. To be had in any required length, 2 yards wide, at 1*s.* 6*d.* per yard run, of ELISHA THOMAS ARCHER, whole and sole manufacturer, 7, Trinity Lane, Cannon Street, City, and the Royal Mills, Wandsworth, Surrey; and of all Nurserymen and Seedsmen throughout the kingdom. "It is much cheaper than mats as a covering."

NO CHARGE FOR STAMPING at LOCKWOOD'S, 75, New Bond Street. GLENFIELD PATENT STARCH, USED IN THE ROYAL LAUNDRY, AND PRONOUNCED BY HER MAJESTY'S LAUNDRESS TO BE THE FINEST STARCH SHE EVER USED.
Sold by all Chandlers, Grocers, &c. &c.

AT MR. MECHI'S ESTABLISHMENTS, 112, Regent Street, 4, Leadenhall Street, and Crystal Palace, are exhibited the finest specimens of British manufactures in Dressing Cases, Work-boxes, Writing Cases, Dressing Bags, and other articles of utility or luxury. A separate department for Papier Maché Manufactures and Bagatelle Tables. Table Cutlery, Razors, Scissors, Penknives, Strops, Paste, &c. Shipping orders executed. Superior Hair and other Toilet Brushes.

SUMMER COATS, CAPES, AND BOYS' CLOTHES, AT BERDOE'S, 96, New Bond Street, and 69, Cornhill, one of the largest stocks in London. Coats, 20*s.* to 25*s.*; the UNIVERSAL CAPE, 20*s.*; Ventilating Waterproof do., 30*s.* (lined). The utility and extreme cheapness of this respectable garment will, on inspection, render commendation needless. First-class Boy's Suit, 11*d.* per inch, according to height.

METCALFE, BINGLEY, AND CO.'S OATMEAL and CAMPHOR SOAP, in tablets (registered Nov. 3, 1854). Price 6*d.* each. This soap will be found the purest and most perfect winter soap ever introduced to the public. It preserves the hands from chapping, and renders the skin soft and agreeable.—Sold wholesale and retail by the inventors and sole manufacturers, METCALFE, BINGLEY, & Co., Brushmakers and Perfumers to H.R.H. Prince Albert, 130B and 131, Oxford Street.

CAUTION.—To prevent fraud, each tablet bears the registered mark and the names and address of the inventors, as above.

METCALFE'S ALKALINE TOOTH POWDER, 2*s.* per box.—The above may be obtained of most respectable Chemists, Perfumers, &c.

SOUND AND WHITE TEETH are not only indispensably requisite to a pleasing exterior in both sexes, but they are peculiarly appreciated through life as a blessing highly conducive to the purposes of health and longevity. Among the various preparations offered for the purpose,

ROWLAND'S ODONTO, or PEARL DENTIFRICE,

stands unrivalled in its capability of embellishing, purifying, and preserving the teeth to the latest period of life. Prepared from Oriental herbs with unusual care, transmitted to this country at great expense, this unique compound will be found to eradicate all tartar and concretions, and impart a pearl-like whiteness to the enamelled surface, remove spots of incipient decay, render the gums firm and red, fix the teeth firmly in their sockets and, from its aromatic influence impart sweetness and purity to the breath. Price 2*s.* 9*d.* per box. Caution.—The words "Rowlands' Odonto" are on the label, and "A. ROWLAND & SONS, 20, Hatton Garden," engraved on the Government stamp affixed on each box. Sold by them, and by Chemists and Perfumers.

DO YOU WANT LUXURIANT HAIR, WHISKERS, &c.?—No other compound for the Hair has maintained such an enduring celebrity as EMILY DEAN'S CRINILENE. It is guaranteed to produce Whiskers, Moustachios, Eyebrows, &c., in a few weeks, and restore the Hair in Baldness, from whatever cause, strengthen it when weak, prevent its falling off, and effectually check Greyness in all its stages.—Price 2*s.* per package (elegantly perfumed); sent post free, on receipt of 24 penny postage stamps, by Miss DEAN, 37 A, Manchester Street, Gray's Inn Road, London. Sold by every Chemist in the world.—"In one fortnight it produced a beautiful set of moustachios." H. ADAMS.—"It has prevented my hair falling off." J. HICKSON.—"It has quite checked the greyness that was coming on." Mrs. ELDER.
Beware of imitations under closely similar names.

RUPTURES EFFECTUALLY CURED WITHOUT A TRUSS.—All sufferers from this alarming complaint are earnestly invited to consult or write to Dr. LESLIE, as he guarantees them relief in every case. His remedy has been successful in curing thousands of persons during the last twelve years, and is applicable to every kind of single and double rupture, however bad or long standing, in male or female of any age, causing no confinement or inconvenience in its use whatever. Sent post free to any part of the world, with full instructions for use, on receipt of 7*s.* 6*d.* in postage stamps, or post-office order, payable at the General Post-office, to Dr. HERBERT LESLIE, 37A, Manchester Street, Gray's Inn Road, London. At home daily (except Sunday) from 11 till 4 o'clock. A Pamphlet of Testimonials, cases, &c., sent post free on receipt of one postage stamp.

MIRACULOUS MEDICINE.

DR. ARNOT'S DIGESTIVE APERIENT PILLS strike at once at the root of disease, throw off the morbific agent, create a new and sanatory condition of the Blood and Secretions, strengthen the Constitution, and speedily restore the patient to Health. A trial will prove the extraordinary curative properties of this medicine.—In boxes at 1*s.* 1½*d.* Order of all Chemists. Depôt, 50, Rathbone Place, London.

THE COMING PILL.—"THE RIGHT PILL FOR EVERY COMPLAINT!"—PAGE WOODCOCK'S WIND PILLS for Wind in the Stomach, Indigestion, Biliousness, Liver Complaints, and all diseases arising from a disordered state of the Stomach and Bowels, will beat the World for efficacy! Try them, and you will say you have got the right Pill this time.—Sold by all respectable Medicine Vendors everywhere, at 1*s.* 1½*d.*, 2*s.* 9*d.*, and 4*s.* 6*d.* If difficulty occur in remote places, send stamps to PAGE D. WOODCOCK, Lincoln, and you will have them by return of Post.

HOLLOWAY'S OINTMENT AND PILLS ASTOUNDING REMEDIES FOR BAD LEGS.—ROBERT DICKIE, of Broad Street, Alloa, informed Mr. Cummings, Druggist, of the same town that about 18 years ago he injured his ankle while at work in a coal pit, which afterwards formed into a running ulcer; to cure it he tried innumerable remedies but without effect. He was in the Royal Infirmary about three years ago, there they said amputation was the only chance of saving his life. However, after all Holloway's Ointment and Pills have been the sole means of healing the wound and rendering his leg perfectly sound.—Sold by all Medicine Vendors and at Professor HOLLOWAY'S Establishments, 244, Strand, London, and 80, Maiden Lane, New York.

TO BE LET, for a term of four or seven years, a HOUSE and GROUNDS, containing a Drawing-room, Dining-room, four Bed-rooms, with Kitchen and other Offices; also Stabling, Coach-house, Yards, &c., and 40 acres of rich PASTURE LAND, beautifully situate one mile from the village of Elstree, four from Harrow Station, and three from Walford.—Apply to Mr. FINNEY, West Surrey, Bank, Guildford.

ST. JOHN'S WOOD.—TO NURSERYMEN & FLORISTS.

TO BE LET, OR SOLD, with immediate Possession, situated in Acacia Road, close to the Regent's Park, a most convenient NURSERY, covering an acre of ground, with Greenhouses, Potting House, Forcing House, Frames, and excellent Stock. Eligibly situated for business, being surrounded with villas. The House consists of Dining and large Drawing-room, six Bedrooms, Bath Room fitted up, with usual domestic offices. A three Stall Stable and Coach House. Rent, 110*l.* Premium, which includes the whole of Glass Frames and Stock, 150*l.*—Apply on the Premises; or of Mr. YEO, 23, Adelaide Road North, Finchley Road, St. John's Wood.

NURSERY AND SEED BUSINESS.

TO BE SOLD, or LET for a term of years, a Nursery, Seed and Plant Business, which has been successfully carried on for the last 35 years in a rapidly rising and most fashionable watering-place in the south of England. The Nursery grounds are advantageously situated in the midst of the town, within half a mile of the Railway Station, and close to its principal entrance is the large Seed and Show Shop. The Grounds comprise about eight acres of good land, and four large Glass Structures, heated with hot water, with several pits and Frames, the whole being well furnished with a Young and Saleable Stock. Any person wishing to carry on the above business will find this well worthy of attention. Satisfactory reasons will be given for the retirement of the present proprietor.—For further information apply to Messrs. E. G. HENDERSON & SON, Wellington Road, St. John's Wood, London.

SHORES OF THE MEDITERRANEAN.

TO BE SOLD, the CHATEAU ST. GEORGES, at CANNES, South of France, one of the most delightful MARINE RESIDENCES IN EUROPE, with or without its Elegant and Appropriate Furniture, all in perfect order, and fit for the immediate reception of any Nobleman's or Gentleman's Family. The Chateau is in the Palladian style of architecture, fitted up with every English comfort, and in a beautifully warm and dry climate, where Sea-bathing may be continued all the year with the greatest convenience. The Gardens on the south side of the Chateau slope down to the Sea, with doors open on to the beach. On the north side the property is bounded by the grande route from PARIS to NICE, from which latter town it is distant about 20 miles south-west. The Chateau is only a few minutes' walk from the seat of Lord Brougham, and about one mile west from the town of Cannes, from which Port there are three Steam-boats weekly to and from Marseilles, and four Diligences to and fro daily between Paris, Marseilles, and Nice.

The Chateau is on an elevated terrace, rising up from the Orange Garden, and within 200 yards of the sea-shore. It was originally built by the late Lieut.-Gen. Sir Herbert Taylor, but has since received considerable additions and embellishments. The terrace floor, occupying the south front, consists of splendid double Drawing-rooms, Library, Dining and Breakfast Rooms, all *en suite*, and opening on to a Doric colonnade of hewn stone, and descending by steps to a beautiful gravelled terrace 250 feet long, facing the "Blue Mediterranean." From the Drawing-room floor a splendid marble stair-case leads to a first and second floor of elegant Bed-rooms, of which there are on the two floors nine to the south front, two to the east, and six to the north, besides six servants' rooms in the attics. Excellent Porter's Lodge at the entrance gate; Poultry-houses, six-stall Stables, large Coach-houses, and splendid Flower and Kitchen Gardens, and a great variety of shady and ornamental walks amongst the natural woods of Cork Trees, Fir, Myrtle, Arbutus, and Maritime Stone Pines; and amongst the granitic rocks are growing the Cactus, Flowering Aloe, and other tropical plants in their natural state—the great variety of level and cultivation giving the idea of a much larger extent of ground. The whole is enclosed with walls, but not obstructing the fine view of the magnificent scenery around, and forms a parallelogram containing about 30,200 square yards, or about seven English acres. The price of the whole is 7500*l.* without Furniture, which may also be had at a valuation, and immediate possession if desired.

For viewing plans and further particulars, apply to Messrs. PRICHARD & COLLETTE, 57, Lincoln's Inn Fields, London, Solicitors.

TO NURSERYMEN AND GARDENERS.

TO BE SOLD, with immediate possession, a long established NURSERY and SEED BUSINESS, in a good Market Town in the South of England, where an excellent trade has been done by the present proprietor for the last 30 years, who now wishes to retire from the business, for which satisfactory reasons will be given.—Address M. M., care of Mr. Poynter, Messrs. Henderson's, Pine-apple Place, Edgeware Road, London.

TO BE SOLD, the LEASE of a very compact NURSERY and GRAPE GROWING BUSINESS near London. Any person about entering into business will find this a genuine concern. The sum required to take it is 250*l.*—For further particulars apply to Mr. WARD, Stationer, &c., Camberwell, Surrey.

PUTNEY.

TO COWKEEPERS, DAIRYMEN, AND OTHERS.

TO BE SOLD, in one or more Lots, about 12 Acres of excellent SPRING TARES ready for cutting. For particulars apply to Mr. J. WILSON, 2, Field Court, Gray's Inn. A reasonable time will be allowed for clearing.

TO NURSERYMEN.

TO BE SOLD, by Private Contract, either altogether or in Lots to suit Purchasers, the long established and flourishing NURSERY PREMISES of the late Mr. George Clarkson, Fulford Road, York, stocked with Forest and Fruit Trees, Shrubs, &c.; and having a substantial Dwelling-House, Shops, and Greenhouse, and other requisite Outbuildings attached—Plans and Particulars may be had on application to Mr. LUKE THOMPSON, Solicitor, Judge's Court, York.

Sales by Auction.

ORCHIDS.

MR. J. C. STEVENS will Sell by Auction, at his Great Room, 38, King Street, Covent Garden, on TUESDAY, 26th June, at 12 for 1 o'clock, a collection of ORCHIDS, established healthy plants of Vanda, Ærides, Cattleyas, Dendrobiums, Oncidiums, Stanhopeas, &c., &c., the private collection of a gentleman.—May be viewed on the morning of sale and Catalogues had of Mr. J. C. STEVENS, 38, King Street, Covent Garden.

SCARLET GERANIUM.

MR. KIRKE will sell by Auction, on the premises, opposite Chelsea Park, Fulham Road, on WEDNESDAY, June 27th, at 12 for 1 o'clock, by order of Mr. SHEARMAN, 2000 SHEARMAN'S SEEDLING SCARLET GERANIUMS, being the largest and most brilliant colour ever produced. Also Roses of sorts, Dahlias, Pinks, Carnations, Calceolarias, Lupins, &c., the whole in pots.—May be viewed (by catalogue, 6*d.* each). Catalogues had on the premises, and at the offices of Mr. KIRKE, 19, Brompton Row, Brompton.

HORTICULTURAL BUILDING AND HEATING BY HOT WATER.

AT THE LOWEST PRICES CONSISTENT WITH GOOD MATERIALS & WORKMANSHIP.

GRAY & ORMSON, DANVERS STREET, CHELSEA, LONDON.

GRAY AND ORMSON, Danvers Street, Chelsea, having had considerable experience in the construction of Horticultural Erections, which, for elegance of design, good materials, and workmanship, combined with economy and practical adaptation, cannot be surpassed by anything of the kind in the country, are in a position to execute orders on the lowest possible terms.

G. & O. have been extensively employed by the Nobility, Gentry, and London Nurserymen; and they can with the greatest confidence give the most satisfactory references to all by whom they have been favoured with orders. Their Hot-water Apparatus is also constructed on the most approved and scientific principles, for all purposes to which the application of Heating by Hot Water can be made available.

COTTAM AND HALLEN, Engineers, Founders, &c.,

B. GREENING & CO., Victoria Iron Works, 1 and 3, Church Gates, Manchester.

COWS.

HARVEY'S CELEBRATED COW DRINKS, 1s. each, have been used with great success. Plain directions are given with each Drink for the treatment of most diseases incidental to Cows, for which they will be found a safe and effectual remedy. One Drink given at the commencement of the Tick, or Feet and Mouth Distemper, will perfectly eradicate it in a few days.—Compounded by R. HARVEY, Veterinary Surgeon, Macclesfield, Cheshire. Sold by all Medicine Vendors Wholesale Agents, BARCLAY & SONS, and MARSDEN & SONS, London.

THE COMFORT OF A FIXED WATER-CLOSET FOR £1.—Places in gardens converted into comfortable Water-closets by the PATENT HERMETICALLY SEALED PAN, with its self-acting valve, entirely preventing the return of cold air or effluvia. Any carpenter can fix it in two hours. Price 1l. Hermetically-sealed Inodorous Chamber Commodes, 1l. 2s., 2l. 4s., and 3l.; also Improved Portable Water-closets, with pump, cistern, and self-acting valve. A Prospectus, with Engravings, forwarded by enclosing two postage stamps.

At FYFE & Co.'s Sanatorium, 46, Leicester Square, London.

COTTAM AND HALLEN have on Show, at their Repository, No. 2, Winsley Street, Oxford Street, London, a great variety of the following articles for the Garden, &c., at very low prices, viz.:—Garden Rollers, Cast-Iron Rickstands, Garden Engines, Mowing Machines, Garden Chairs, Superior Garden Tools of all kinds, Garden Vases and Pedestals in great variety, and a large assortment of Horticultural and Agricultural Implements.

Ornamental Wire Flower Stands, Pot Trainers, Rose Tree Guards, Flower Bordering, and every description of Wire Work, both plain and ornamental.

Hand Glass Frames, Cast and Wrought Iron Flower Stakes, Garden Arches, &c.

Strong Iron Hurdles, and best Wire for Strained Wire Fencing.

Hothouses, Conservatories, &c., made upon the most improved principle, either of Iron, or of Iron and Wood combined, which can be fixed complete, with Hot Water Apparatus, in any part of the Kingdom.

Show Rooms at the Manufactory, 2, Winsley Street, Oxford Street, opposite the Pantheon, where every information may be obtained.

BEE HIVES.

NEIGHBOUR'S IMPROVED COTTAGE BEE-HIVE, as originally introduced by GEORGE NEIGHBOUR & SONS, with all the recent improvements, glasses, thermometer, &c., price 20s., securely packed for the country.

This unique hive has met with universal commendation, and may be vented with safety, humanity, and profit, by the most timid; its arrangements are so perfect, that the honey may be taken at any time of the gathering season without at all injuring the bees.

Early applications, addressed to GEO. NEIGHBOUR & SONS, 127, High Holborn, or 149, Regent Street, London, will receive prompt attention. Their newly arranged Catalogue of other improved Beehives, with Drawings and Prices, sent on receipt of two stamps.

Agents:—Manchester, HALL & WILSON, 50, King Street; Liverpool, JAMES CUTHBERT, 12, Clayton Square; Chester, F. & A. DICKSON & SONS, 106, Eastgate Street; Glasgow, ANDREW & M'ASLAN, 186, Trongate Street; Dublin, J. EDMUNDSON & Co., 61, Dame Street.

HORTICULTURAL SOCIETY OF LONDON.—NOTICE IS HEREBY GIVEN, that the NEXT EXHIBITION of FLOWERS and FRUIT, in the SOCIETY'S GARDEN, will take place on WEDNESDAY, July 11, at 2 P.M.

Tickets, price 5s. each, can be procured at this Office, upon presenting the order of a Fellow; or on the day of the meeting, at Turnham Green, price 7s. 6d. each.—21, Regent Street, London.

ROYAL BOTANIC SOCIETY, REGENT'S PARK.—The LAST EXHIBITION this season of PLANTS, FLOWERS, and FRUIT will take place on WEDNESDAY, July 4th. Tickets to be obtained at the Gardens only, by orders from Fellows or Members of the Society. Price 5s., or on the day of Exhibition, 7s. 6d. each.

N.B. By accident some of the tickets issued are wrongly dated July 5th instead of Wednesday, July 4th. The holders of such Tickets are requested to correct the date.

ROYAL SOUTH LONDON FLORICULTURAL SOCIETY, under the Patronage of her most gracious Majesty the QUEEN.—The Third Exhibition of the season will take place at the Royal Cremorne Gardens, Chelsea, on THURSDAY, July 5. Open to all Exhibitors. Prizes will be awarded for the following productions, viz.:—Collections of Miscellaneous Plants, Cape Heaths, Orchideous Plants, Pelargoniums, Variegated Plants, Fuchsias, Roses, Pinks, Verbenas, Cut Flowers, and Fruit; also numerous extra Prizes offered by members. Lists of Prizes and the Rules of the Exhibition may be obtained of Mr. SIMPSON, Royal Cremorne Gardens, Chelsea; and of the Secretary, Ebenezer House, Peckham, JOHN TAYLOR NEVILLE.

SLEAFORD FLORAL AND HORTICULTURAL SOCIETY.—At the Annual Exhibition of this Society at Sleaford, on THURSDAY, the 26th of July next, an Extra Prize of Five Guineas, open to all England, will be awarded for the best collection of Twelve Stove and Greenhouse Plants, in addition to the usual Members and Cottagers' Prizes. The rules of the Society, with Schedules of Prizes, may be obtained on application to Mr. WARWICK, the Treasurer; or to Mr. PEAKE, Honorary Secretary.—Sleaford, June 30.

EXHIBITION OF AMERICAN PLANTS.
KNAP HILL NURSERY, WOKING, SURREY.

WATERER AND GODFREY beg to announce that the AMERICAN PLANTS at this Nursery are now in great beauty, and may be seen daily gratis. The Nursery is readily reached by Railway to the Woking Station, where capital conveyances may always be obtained.

GREAT EXHIBITION OF AMERICAN PLANTS.

JOHN WATERER begs to announce that his unrivalled collection of Hardy, Scarlet, and other RHODODENDRONS, is now on view at the Royal Botanic Gardens, Regent's Park, London. Orders of admission are granted gratuitously by Fellows of the Society. The Plants at the Nursery are now in full bloom—The American Nursery, Bagshot, Surrey, June 30.

*** Plans and Estimates furnished.

DAVID FERGUSON, LANDSCAPE GARDENER, GARDEN ARCHITECT, and CONTRACTING PLANTER, Stowe, Buckingham. Now is the time to prepare for planting in September, October, and November.

JOHN HARRISON, NURSERYMAN, SEEDSMAN, FLORIST, LANDSCAPE GARDENER, &c.
Plans and Estimates furnished; Experienced Gardeners recommended; also several Young Men in the Nursery waiting for Under Gardeners' Situations.—Darlington, June 30.

GEORGE TAYLOR, JUN.,
CHOICE FRUIT and VEGETABLE SALESMAN,
St. John's Market,
Liverpool.
CONTRACTOR and PURCHASER of CHOICE GARDEN PRODUCE.
SALESMAN on COMMISSION.
Terms, Cash.
Forward as above.

TO BE SOLD, ARAUCARIA BRAZILIANA, standing 9 feet high from the ground, in an earthen vase. The plant is in vigorous growth, and is sold because it is getting too high for the greenhouse.—Apply to Mr. MASTERS, Exotic Nursery, Canterbury.

AZALEAS AND ERICAS.

W. J. EPPS has much pleasure in offering the following fine, bushy, well-grown plants, and of the choicest and best varieties, in large 48 and 32-size pots.
AZALEAS 18s. per dozen; 5l. per 100.
ERICAS 12s. and 18s. per dozen; 4l. and 5l. per 100.
These will make very pretty specimens for the ensuing season; all orders to be accompanied with a remittance from unknown correspondents.—Maidstone, June 30.

IMPROVEMENT OF GRASS LANDS.

SUTTON'S RENOVATING GRASS SEEDS should be sown immediately after the hay is carried.

These Seeds consist of PERENNIAL CLOVERS *and* FINE GRASSES *for improving the bottom.* Price 9d. per lb., or 80s. per CWT. Eight or 12 lbs. per acre will be sufficient, and will produce a great increase in the produce.—SUTTON & SONS, Reading, Berks.

THE BEST SUBSTITUTES FOR SWEDES.

SUTTON'S PURPLE-TOP YELLOW HYBRID, SUTTON'S GREEN-TOP YELLOW HYBRID AND ORANGE JELLY TURNIP.—Prices, &c., will be forwarded, Post-free, on application (stating quantity required), by SUTTON & SONS, Seed Growers, Reading.

THE QUICKEST TURNIP KNOWN.

SUTTON'S EARLY SIX-WEEKS TURNIP.—*Good New Seed 1s. per lb., or 6s. p. gallon, 45s. per bush.* Carriage free except small parcels.
SUTTON & SONS, SEED GROWERS, Reading.

TURNIP SEED OF PURE SELECTED STOCKS.
FOR

BASS AND BROWN'S Advertisement of present prices, see *Gardeners' Chronicle* of April 28th, and May 5th and 12th. Reduced prices for large quantities.

ERRATA.—For "Laing's Purple-top Swedes, 1s. per lb.," *read* "1s. 9d. per lb." the same price of the other three Swedes.

TO THE TRADE.—Prices will be supplied on application.
Seed Establishment, Sudbury, Suffolk.

THE BEST EARLY CABBAGE GROWN.

COTTRELL'S EARLY CHAMPION may be sown any season. Sold in sealed packets, 1s. per oz. The usual allowance to the Trade.—To be had only of DAWE, COTTRELL, & BENHAM (Successors to F. Warner), Wholesale Seedsmen, 3, Lawrence Pountney Lane, and 36, Moorgate Street (late 28, Cornhill). Established 1720.

ENGLISH GROWN RAPE, OR COLE SEED.

CHARLES SHARPE AND CO. beg to acquaint the Trade that they can supply any quantity of the above; prices and samples forwarded on application.
Nursery and Seed Establishment, Sleaford, June 30.

CHRYSANTHEMUMS.

CHANDLER AND SONS, NURSERYMEN, Wandsworth Road, Vauxhall, are now sending out good plants of the best CHRYSANTHEMUMS, large and small varieties, from 9s. to 12s. per dozen. A Catalogue may be had on application.

JOSEPH NORRIS, Osterley Park, Hounslow, Middlesex, having an immense Stock of PANSIES, including all the finest and newest in cultivation, offers them at 6s., 9s., and 12s. per dozen, package included, sent to any address on the receipt of a Post Office Order, payable at Hounslow.
The Trade supplied.

WHITE LISBON ONION SEED.—Large buyers can be supplied with White Lisbon Onion Seed in quantity.—Apply to Mr. HENRY CLARKE, Seed Merchant, 39, King Street, Covent Garden.

SUPERB HOLLYHOCKS, SEEDS, ETC.

WILLIAM CHATER begs to offer packets of seed, consisting of 20 varieties, from his best Show Hollyhocks at 5s.; 12 varieties, 2s. 6d.; and from good double sorts, 1s.

Superior Quilled German and French Asters, in 12 varieties, mixed, 1s. per packet; separate, 2s. Fine Quilled African Marigolds, 6d. per packet.—Saffron Walden Nurseries.

EMPEROR NAPOLEON—A NEW SCARLET GERANIUM.

JOHN BUTCHER is now sending out the above splendid GERANIUM (a Seedling raised by himself), being a very decided improvement upon the great favourite TOM THUMB; the habit is more compact, the trusses of Flowers very much larger, and for brilliancy of colour far superior, sending up the truss of Flower finely above the Foliage. Fine for Bedding or Vases. Was exhibited at the Royal Botanic Gardens, Regent's Park, London, June 13 (see *Gardeners' Chronicle* of June 16).—June 30.

HOLLYHOCK SEED.

A. PAUL AND SON have ready for immediate sowing a fine lot of HOLLYHOCK SEED saved from their choicest varieties which have obtained many of the leading prizes during the last three years:—

	s.	d.
1st selection, saved from 25 varieties, per packet ...	5	0
2d do. " 12 " " ...	2	6
Good Mixtures	1	0

N.B. Free by post, and payment received in postage stamps.
Nurseries, Cheshunt, Herts.

ROSES.

A. PAUL AND SON invite inspection of the Collection of ROSES at the Cheshunt Nurseries, which is just coming into Bloom, and will continue to offer new objects of interest from the present time till the end of October. The best means of reaching the Nurseries is by Eastern Counties Rail to Cheshunt or Waltham Stations.
Cheshunt Nurseries (13 miles N.E. of London), June 30.

CALCEOLARIA SEED.

R. PARKER has now ready for sending out Seed which he can recommend with the greatest confidence, it having been saved from flowers of the finest form and most beautiful markings, in packets at 1s. 6d. and 2s. 6d. each. Also choice CINERARIA seed saved from the finest named varieties, at 1s. 6d. and 2s. 6d. per packet. A remittance or reference to accompany all orders from unknown correspondents.
Paradise Nursery, Hornsey Road, London.

TRELOAR'S COCOA-NUT FIBRE MANUFACTURES, consisting of MATTING, MATS, MATTRESSES BRUSHES, NETTING, HORSE-HAIR, and BRISTLE SUBSTITUTE, are distinguished for superiority and excellency of workmanship, combined with moderate prices. Prize Medal both in England and America at the Exhibition of all Nations.
T. TRELOAR, Cocoa-nut Fibre Manufacturer, 42, Ludgate Hill, London.

TO NURSERYMEN AND GARDENERS.

REIGATE SILVER SAND, 12s. per ton, 1s. 6d. per bushel, or 16s. per ton, delivered to any of the London Wharfs or Railways, or within a circuit of five miles. Peat and Loam of various qualities. Sacks 2s. each.
KENNARD BROTHERS, Swan Place, Old Kent Road.

FOR WATERING GARDENS.

HANCOCK'S IMPROVED VULCANISED INDIA-RUBBER HOSE AND TUBING is now manufactured especially for the above purpose; is of greater flexibility than any other description of Hose; is capable of resisting great pressure, and made suitable for attaching to the mains of water-works, or to tanks of high elevations.

WATERING HOSE fitted up with the necessary *brass joints, stop-cocks, branches,* and *spreaders complete.*

VULCANISED INDIA-RUBBER SUCTION PIPES, made any length or size for Pumps or Garden Engines.

VULCANISED RUBBER WASHERS, and also in Sheet, any thickness, for all kinds of steam and water joints, or made any size or figure to order.

All communications and orders punctually attended to, addressed to the Manufactory, JAS. LYNE HANCOCK, Goswell Road, London.

TO LAND AGENTS, STEWARDS, GARDENERS, ETC.

MITCHELL'S ANTISEPTIC MINERAL BLACK PAINT is the best and cheapest preservative of Park Fencing, Barns, Out-houses, and all outside Wood and Iron Work. Sold ready for use, price 17s. 6d. per cwt. Allowance on large orders. Used largely now and for many years past by the West India Dock Company for Fencing, Lockgates, Barges, &c.
Manufactory: Kennington Lane, Lambeth.

CARSON'S ORIGINAL ANTI-CORROSION PAINT, specially patronised by the British and other Governments, the Hon. East India Company, the principal Dock Companies, most public bodies, and by the nobility, gentry, and clergy, for out-door work at their country seats. The Anti-Corrosion is particularly recommended as the most durable out-door Paint ever invented, for the preservation of every description of Iron, Wood, Stone, Brick, Compo, Cement, &c., work, as has been proved by the practical test of upwards of 60 years, and by the numerous (between 500 and 600) testimonials in its favour, and which, from the rank and station in society of those who have given them, have never yet been equalled by anything as the kind hitherto brought before the public notice.

Lists of colours, prices, together with a copy of the testimonials, will be sent on application to WALTER CARSON & SON, 9, Great Winchester Street, Old Broad Street, Royal Exchange, London.

No Agents. All orders are particularly requested to be sent direct.

TANNED NETTING, for the protection of Fruit Trees from frost, blight, and birds, and for the security of fresh sown seeds, either in Gardens or Fields, at 1d. per square yard; 200 yards, 14s.; 500 yards, 30s.; 1000 yards, 50s. Scrim Canvas, for Wall Fruit.—At EDGINGTON and Co.'s, Rick Cloth, Tent, and Waterproof Cloth Manufacturers, 17, Smithfield Bars, City, and Old Kent Road, Southwark; Emigrant Outfitters, Ship Chandlers, and Export Merchants, Brunswick Street, near the East India Export Dock, Blackwall.

GARDEN NETS, FISHING NETS, AND SHEEP NETS, &c., made by machinery, and sold at very low prices. Worsted Wasp Net, well adapted for shading greenhouses, admitting air and excluding Bees; also for Protecting Blossom and the Ripe Fruit afterwards, 7d. per square yard, in various widths. Sheep Nets, 20s. per 50 yards, nearly 4 feet high. Double Walled Trammels, on the best construction, 3s. per yard run, 6 feet deep.—R. RICHARDSON, 21, Tonbridge Place, New Road, London.

EIGHT HOUSES ON WHEELS 12 feet long by 7 feet broad, and 8 feet high inside, suitable for Cottagers, Gamekeepers, Watchers, Shepherds, or Freehold Land Allotments. Price 15l. each, or 11l. without Wheels, Springs, and Axles.—R. RICHARDSON, 21, Tonbridge Place, New Road, London.

MARQUEES ON HIRE TO SUIT THE TIMES—50 feet by 30 feet, 3l.; 70 feet by 30 feet, 4l.; 100 feet by 30 feet, 5l. A large Round Tent, 60 feet diameter, with six swings, for gatherings of school children, 4l. On Sale, Umbrella Tents, 10 feet diameter, 4 feet to 12 feet, 3l. Wire-framed Garden Tents, 4l. Patrol Tents (weight 12 lbs.), 25s., packed in bag.—R. RICHARDSON, 21, Tonbridge Place, New Road, London.

N.B. Rickcloths, 30 feet by 30 feet, for 30 tons of hay, price 5l. 10s. each.

"FRIGI DOMO."—Patronised by her Majesty the Queen, the Duke of Northumberland for Syon House, His Grace the Duke of Devonshire for Chiswick Gardens, Professor Lindley for the Horticultural Society, Sir Joseph Paxton for the Crystal Palace, Royal Zoological Society, Mrs. Lawrence, of Ealing Park, and — Collier, Esq., of Dartford.

PROTECTION FROM MORNING FROST.

"FRIGI DOMO," a Canvas made of patent prepared Hair and Wool, a perfect non-conductor of Heat and Cold, keeping, wherever it is applied, a fixed temperature. It is adapted for all horticultural and floricultural purposes, for preserving Fruits and Flowers from the scorching rays of the sun, from wind, from attacks of insects and from morning frosts. To be had in any required length, 2 yards wide, at 1s. 6d. per yard run, of ELISHA THOMAS ARCHER, whole and sole manufacturer, 7, Trinity Lane, Cannon Street, City, and the Royal Mills, Wandsworth, Surrey; and of all Nurserymen and Seedsmen throughout the kingdom. "It is much cheaper than mats as a covering."

GARDEN VASES, FOUNTAINS, ETC.

THOMAS SOMMERVILLE, LANDSCAPE GARDENER, NURSERYMAN, SEEDSMAN, and FLORIST, Garden Road, St. John's Wood, London, begs respectfully to inform the nobility, gentry, and his patrons generally, that he has entered into arrangements with an eminent company in Scotland for the sale disposal in London of their highly ornamental and very durable Vases, Fountains, &c., samples of which may be seen at his grounds in the Garden Road, as above.

T. S. has much pleasure in being the first to introduce to the notice of the public a highly ornamental Vase, capable of resisting the most severe weather, and at little more than half the cost of any other possessing the same qualities; and he has no hesitation in stating that a more suitable Vase for the growth of plants cannot be manufactured.

GLASS FOR CONSERVATORIES, GREENHOUSES, PIT FRAMES, ETC.

JAMES PHILLIPS AND Co. have the pleasure to hand their present reduced prices of Glass for Cash :—

A large assortment of every description of Garden Syringes, Pail Engines, Conservatory Pumps, &c., kept in Stock.

No. 1, Plain Syringe, with rose and jet, diameter of barrel, 1¼ inch, 14s. 3d.; No. 2, do., diameter of barrel, 1⅜ inch, 12s.; No. 3, do., diameter of barrel, 1⅜ inch, 10s. 6d.

READ'S SYRINGE, with two roses and one jet, 19s.

J. TYLOR & SON'S Horticultural Apparatus may be obtained at these prices from any respectable Ironmonger or Seedsman in town or country, through whom alone they will be supplied, and of whom Drawings and Prices may be had.

N.B. Cost of carriage, &c., not included in these prices.

J. TYLOR & SON'S Manufactory, Warwick Lane, Newgate Street, London.

J. TYLOR AND SON'S REGISTERED GARDEN SYRINGE.—Small size, for Amateur use, **21s.** each. Large size, for Gardeners' use, **25s.** each.

Extra for Telescope Tube as shown in engraving for watering plants on stands at a height of 8 feet, so that any quantity of water can be deposited in the pot without wetting the leaves, 10s.

By a simple arrangement this Syringe is rendered more effective than any portable Conservatory or Garden Pump ever offered to the public. It is equally adapted for Garden or Conservatory use, and is capable of discharging twice as much water in a given time as any other Syringe now in use. The arrangement consists in attaching a small flexible suction tube to the barrel of the Syringe, through which it is filled with water at every discharge of the previous contents. By this means the Syringe is always charged, and the pull-up stroke of the piston rendered perfectly easy, it having, indeed, no work to do, the barrel being previously full of water. Being thus made self-supplying, a great saving of labour is effected; and the necessity of stooping to fill the syringe at every discharge being done away with, the direction of the water can be maintained for any length of time. It is perfectly cleanly in its action, as it is not possible for any water to get on the outside of the barrel, which is a well-known inconvenience attendant on the use of every other Syringe. Its construction is perfectly simple, and cannot get out of order; the ground in ball valves and fittings used for filling all other patent Syringes being entirely superseded. To be had of any respectable Ironmonger or Seedsman in town or country.

J. TYLOR & SONS, Manufacturers of Horticultural Apparatus Warwick Lane, Newgate Street, London.

N.B. These prices do not include carriage, package, or expense of delivery in the country.

BY HER MAJESTY'S

ROYAL LETTERS PATENT.

E. DENCH, PATENT HOTHOUSE WORKS, KING'S ROAD, CHELSEA. Printed Price Lists sent on application.

HORTICULTURAL WORKS AND HOT-WATER APPARATUS MANUFACTORY.
KENSAL GREEN, HARROW ROAD, LONDON.

JOHN TAYLOR AND SON beg to call the attention of the nobility and gentry to the very superior manner in which they Erect all kinds of Conservatories, Vineries, Greenhouses, &c., combining every improvement with elegance of design, and durability of materials and workmanship.

Their VENTILATING APPARATUS for the Fronts and Roofs of Houses has given the highest satisfaction. Churches, Chapels, Schools, Entrance Halls, Public Buildings, &c., heated with Hot-Water Apparatus in a most economical and efficient manner. J. T. & SON have great pleasure in referring to numbers of the nobility and gentry by whom they are extensively employed.

HOTHOUSES, CONSERVATORIES, FRAMES & LIGHTS FOR PITS, CUCUMBER & MELON BOXES & LIGHTS.

JAMES WATTS, HOTHOUSE BUILDER, 8, Chrisman's Place, Old Kent Road, London.

Green and Hothouses, 9, 10, 11, 12, 13, and 14 feet wide, any length, from 16 to 100 feet. Frames and Lights for Pits, 6 ft. 6 in., 7 ft., 7 ft. 6 in., 8 ft., and 8 ft. 6 in. wide, any length, from 13 to 100 feet. Upwards of 200 Cucumber and Melon Boxes and Lights, from 4 ft. by 3 to 10 ft. 6 in. by 5 ft. 6 in., kept ready glazed with stout sheet glass, painted four times, complete, ready for immediate use, all made of best material, packed and sent to all parts of the kingdom.—Reference may be had to the Nobility, Gentry, and the Trade, in most of the counties in England.

HORTICULTURE IN ALL ITS BRANCHES.

JOHN WEEKS & Co., King's Road, Chelsea

HOTHOUSE BUILDERS.

THE NOBILITY AND GENTRY about to erect Horticultural Buildings, or fix Hot-water Apparatus, will find it at our Horticultural Establishment and Hothouse Works, King's Road, Chelsea, an extensive variety of Hothouses, Greenhouses, Conservatories, Pits, &c., erected, and in full operation, combining all modern improvements, so that a lady or gentleman can select the description of House best adapted for every required purpose.

The HOT-WATER APPARATUS, which passes through all the Houses and Pits, affording both top and bottom heat, is in constant operation and particularly worthy of attention.

Many of the Houses and Pits are of wide and lofty dimensions, and together equal in length 1000 feet. They are all effectually heated by *one boiler*, which, during the severe winter months does not cost in labour and fuel more than 3s. 8d. per day, and the apparatus is so arranged that each House or Pit may be heated separately and to the required temperature. The splendid collections of Stove and Greenhouse Plants are also in the highest state of cultivation, and for sale at very low prices. Also a fine collection of strong Grape Vines in pots, from eyes, all the best sorts.

Plans, Models, and Estimates of Horticultural Buildings and Catalogues of Plants, Vines, Seeds, &c., forwarded on application to JOHN WEEKS & CO., King's Road, Chelsea, London.

NEW SPRING CABBAGE "EXCELSIOR."

WILLIAM KNIGHT, SEEDSMAN, &c., begs to call attention to this fine variety, which is unsurpassed for its excellent quality, being of a very superior flavour, and a certain crop, as it has never been know to run to seed before heading; it is particularly hardy, standing the test of the last winter without a failure. As a certain crop for spring use it is invaluable, for it may be sown at any time without risk, and it will produce a certain crop. Seed is now ready to send out in packets 1s. each, or four packets for 3s., post free.

67, High Street, Battle, Sussex.

MESSRS. E. G. HENDERSON AND SON beg to announce that their NEW SPRING CATALOGUE for 1855 will be sent post free on application, and for 12 postage stamps a Beautiful Coloured Plate, representing the following choice plants:—

Achimenes Ambroise Verschaffelt.
Acacia Drummondi microphylla
Boronia Drummondi
Bouvardia longiflora
Delphinium Hendersoni
Genetyllis macrostegia (fuchsioides)
Fuchsia Queen Victoria
" Mrs. Story
" Prince Albert

Mr Andrews, the first floricultural artist of the day has had the getting up of this Plate, so that full reliance may be placed on the correctness of the flowers represented and the superior style of colouring.—Wellington Nursery, St. John's Wood. June 30.

PLANTS OF CABBAGE, SAVOY, KAIL, BROCCOLI, CELERY, AND CAULIFLOWER.

JOHN CATTELL begs respectfully to inform the public that he has a plentiful supply of Plants of his superior true sorts of the above, which will be forwarded to order on receipt of Postage Stamps, or Post Office Order made payable here, at the following prices, package included:—

All the sorts of Early Cabbage, Savoy, and Kail, including Brussel sprouts, 6d. per 100, 4s. 6d. per 1000: all the sorts of Broccoli, 9d per 100, 5s. 6d. per 1000; all the sorts of Celery, bedded plants 8d. per 100, 5s. 6d. per 1000; Cauliflower, early and late 10s. per 100; Red Cabbage, 1s. per 100; Drumhead, or Cattle Cabbage, 4s. per 1000. A fine stock of autumn-bedded early Cabbage still to dispose of at 5s. per 1000; for large quantities, price on application. Packages containing plants to the value of 1l. and upwards will be delivered carriage free to London and to the Edenbridge Station of the South Eastern Railway. A remittance must accompany orders from unknown correspondents. Seed of Cattell's Dwarf Barnes, and of his superior Dwarf Reliance Cabbage, may be had in packets by post, for 12 penny stamps per packet, the former containing one ounce, and the latter half an ounce.—Nurseries, Westerham, Kent.

ERICAS.

MESSRS. YOUELL AND CO. beg to submit the following list of choice ERICAS, which can be supplied in good bushy and healthy plants, in large and small 48s, at 12s. per dozen:—

ERICAS:—Aggregata, ampullacea, ampullacea carnumbrata, ampullacea rubra, aristata major, Archeriana, Bandoniana, bicolor, Cavendishi, cerinthoides, cer. coronata, Cliffordi, colorans, Coventryana, daphnoidea, Devoniana, depressa, denticulata moschata, echiflora, elata, Ewerianа, eximia, exurgens coccinea, gracilis, grandis, Hartnelli, hyemalis, hybrida, hyacinthiflora, Juliana, Linnæoides nova, L. superba, longiflora, metulæflora bicolor, ovata, perspicua nana, pinifolia discolor, princeps, propendens, p. tubiflora, pyriformis, primuloides, rubens, retorta major, Savilleana, Shannoniana, Shannoniana (Turnbull), Sindryana, splendens, tricolor, tri. rubra, umbellata, ventricosa alba, v. alba tincta, v. breviflora, v. carnea, v. coccinea minor, v. corvicana, v. curta ruba, v. densa carnea, v. dependens coccinea, v. fasciculata longiflora, v. f. rosea, v. f. superba, v. globosa, v. hirsuta, v. magniflora, v. perspicuoides, v. superba, v. tumida, v. tenuiflora, vernix coccinea, Vernonia, Ver. superba, verticillata, vestita tenuiflora, v. coccinea, v. c. tenuiflora, v. fulgida, v. rosea, viridiflora, Westcotti, Westphalingi, Wilmorea superba, Walkeri.

The above are well grown, and of a suitable size for making specimens. The usual discount to the trade when taken per 100.

Royal Nursery, Great Yarmouth.

NEW CABBAGE.—THE CHAMPION OF ENGLAND, which has surpassed everything of its kind during the past severe winter (when nearly every other has failed) and turned well into Cabbage this spring. This Cabbage is of a very dwarf and compact habit, and quite equal in flavour to any yet grown. It has been in the hands of a very excellent gardener for several years, and he has thoroughly proved its superior hardy and good qualities. The stock of seed purchased is very limited, therefore none can be sold by the pound or in large quantities to the Trade this year. E. T. feels confident, from what he has seen of the Cabbage, that it will give the greatest satisfaction to all purchasers. Sold in packets of 1 oz., 2s. 6d.: or of half an ounce, 1s. 6d., postage free.

The TRUE OLD BATH COSS LETTUCE, which Lettuce has never been surpassed by any other yet grown. 1s. per packet.

☞ This being the proper time for sowing the following varieties of Hardy Flowering Seeds for blooming next spring, the following undermentioned varieties will give the greatest satisfaction to all purchasers as they have hitherto done for many past seasons:—

SWEET WILLIAM SEED—Saved from 50 of the choicest and most superb varieties. 1s. per packet.

ANTIRRHINUM SEED—Saved from all the striped, spotted, and finest shaped varieties. 1s. per packet.

Superb HOLLYHOCK SEED — Saved from all the best named flowers out last year. 1s. per packet.

SCARLET GIANT BROMPTON STOCK, extra fine. 1s. per packet.

PANSY SEED—A few packets from selected varieties. 1s. per packet.

AQUILEGIA OR COLUMBINE SEED—Saved from 12 distinct varieties. 1s. per packet.

☞ Either of the above packets of Flower Seeds three for 2s. 6d.

A remittance must accompany every order either in cash or penny postage stamps, when the whole, or any part of the above as the case may be, will be forwarded.

EDWARD TILEY, Nurseryman, Seedsman, and Florist, 14, Abbey Church Yard, Bath, Somerset.

NEW AND RARE PLANTS to be seen in blossom at the Tooting Nurseries:—

Azalea indica, gem, new
Barkeria melanocaulon, new
Cypripedium caudatum purpureum, new
" species; this truly magnificent new plant has been discovered by our collector, Mr. John Henshall, in Java, growing at an elevation of 7000 feet above the level of the sea
Erica obbata pulchella, new
" tricolor magnifica, new
" ventricosa flava, new
Ærides Larpentæ, rare
Geranium Empress, new. This variegated variety far exceeds both in foliage and blossom any other of this class, and is admirably adapted either for bedding or pot culture
Gloxinia Adamis oculata, new
Meyenia erecta: this unquestionably is the gem of the season in new plants
Rhododendron Stamfordiana, new
" pavonia, new
" Shakespeare, new
Uropedium Lindeni, rare

Messrs. WILLIAM ROLLISSON & SONS will be happy to forward their Priced Catalogue of New and Rare Plants, post free on application. They will also be forwarded throughout the following countries, post free:—America, Austria, Belgium, France, Germany, Holland, Prussia, &c.

CHOICE NEW AND RARE PLANTS OF THIS SEASON AT REDUCED PRICES.

HENRY WALTON, FLORIST, &c., Edge End, Marsden, near Burnley, Lancashire, will be prepared to send out nice healthy plants of the following new novelties at the reduced prices as annexed, after the first week in July.

FUCHSIAS.—Story's Mrs. Story, 3s. 6d.; Queen Victoria, 3s. 6d.; Water Nymph, 3s. 6d.; Empress Eugenie, 3s. 6d.; Lady of the Lake, 3s. 6d.; Snowdrop, 3s. 6d.; Banks' Beauty of the Bower, 2s. 6d.; Prince Albert, 3s. 6d.; Maid of Kent, 3s. 6d.; Climax, 2s. 6d.; Grand Sultan, 2s. 6d.; Omer Pasha, 2s. 6d.; Smith's Omer Pasha, 2s. 6d.; Violæflora pleno, 3s. 6d. each, or 30s. per dozen post free where two or more are ordered.

Each.—	s. d.	Each.—	s. d.
Hydrangea hortensis ...	5 6	Phlox omniflora compacta, dwarf white	2 6

Clapham Rise, June 30.

WHEELER AND SON'S SHORT SELECT SEED LIST.—Our Priced List of Seeds for this season, containing Descriptions and Prices of the best GARDEN and FLOWER SEEDS, will be forwarded free by post. It is our earnest endeavour to send out all Seeds, whether for the Garden or Farm, of the very best quality and true to name; and as many of the Seeds are our own growing, and are proved before sending out, we generally succeed in giving entire satisfaction to our customers.

We are in daily receipt of most gratifying letters and renewed orders from those we had the honour of serving last year; and as we deliver our Seeds CARRIAGE FREE, we very respectfully solicit the honour of an order from those who have not yet given us a trial.—J. C. WHEELER & SON, Gloucester, Seedsmen to the Gloucestershire Agricultural Society.

THE GARDENERS' CHRONICLE AND AGRICULTURAL GAZETTE UNDER THE NEW STAMP ACT.

IN consequence of the Repeal of the Newspaper Stamp, the price of this Journal will be on and after this day 5d. unstamped, and 6d. stamped.

An *unstamped* copy can be sent by post by affixing a 1d. postage stamp upon each transmission. A *stamped* copy may be sent free as often as desired during fifteen days from the date of the paper, provided the paper be so folded that the stamp may be visible.

Subscribers will please to inform their Agents whether they desire stamped or unstamped papers.

The Gardeners' Chronicle.

SATURDAY, JUNE 30, 1855.

MEETINGS FOR THE ENSUING WEEK.

WEDNESDAY, July 4—Royal Botanic..... 2 P.M.

A GERMAN correspondent, writing from Travemünde, asks what is meant by VITAL FORCE. We said (in No. 19 of the *Gardeners' Chronicle* for the present year) that the very different effects produced by frost on plants of the same kind exposed to influences in every respect similar, were explicable only on the supposition that each plant has its own peculiar vital force. We are asked what we mean by this, and whether just the same information is not conveyed by being told that some plants suffer and some, apparently like them, do not, but why we do not know. The complaint is that no real explanation is given, and that no general law is laid down, of which the different effects can be said to be instances. Our correspondent does not complain of our present ignorance of the causes producing the results alluded to, he merely objects to the expression made use of, which, as he says, only serves as a cloak for ignorance, which had better be openly avowed, and to discourage further investigation by referring the phenomena to a hidden cause peculiar to each plant, and undiscoverable by man.

To this we reply that no other explanation is possible, and that vitality, whatever it may be, is a force varying in intensity like other forces. To ignore its existence is to deny the evidence of our senses; to attempt to explain its power by reference to mechanical, or chemical, or similar agencies is materialism. What agencies of that kind will explain the reason why the sensitive plant is all activity in warmth, and torpid in cold; why the elastic column of a Stylidium, the delicate bristles of a Dionæa, the dancing leaflets of the Hedysarum, and a thousand other sensitive organisms all obey the same influences in the same manner? In these instances heat acts upon vitality as among insects; the fly is torpid in cold, but all life and activity with sufficient warmth. What again except the presence of vital force, identical in its essence with that of animals, but widely different in its manifestations, will explain the undoubted fact that plants are affected, just as animals, by prussic acid, chloroform, opium, arsenic, and other poisons. Upon this subject we refer our correspondent to the new edition of the "Theory of Horticulture," the first chapter of which is exclusively occupied by an inquiry into the nature of this force. And we are convinced that its

PAGE AND CO.'S COMPOSITION FOR THE DESTRUCTION OF BLIGHT

UPON THE

Hop, Roses, Wall-Fruit Trees, Cucumbers, Melons, Vines, and Stove and Greenhouse Plants.

B. PAGE AND CO. having erected additional Works, are now ready to supply any quantity of their valuable Composition, approved and in use by all the leading Gardens of the United Kingdom.

Extra Strong, 4s. per gallon, sufficient to make four (Jars and Barrels extra).
Ten gallons and upwards Carriage Free to London.

The next season's crop of Peaches, &c., will much depend upon the Aphis being destroyed, which is now severely attacking them.

Oxford Street Seed Stores, Southampton.

not having been sufficiently recognised is the cause of half the errors into which routine cultivators are seen to fall.

In saying this we would by no means assert that all obscure facts are explicable only by reference to vitality, or that the explanations founded upon it are in all cases just. It is possible enough that they may be misapplied, like other matters; and we are far from claiming for ourselves exemption from such errors. All we contend for is that vitality, a force which our senses tell us exists although we only see it in its results, will often account intelligibly for phenomena, which are otherwise incomprehensible.

By way of establishing the converse of this proposition, the following account of the effects of the late frosts is given in our correspondent's letter. "Close to my house," he says, "there is a number of Sycamores; they are all on ground equally dry and sandy; moreover all have the same aspect. Amongst them the three most healthy and strong of all, viz., an *Acer Lobelii* (Tenore), an *Acer colchicum rubrum*, and, what is very remarkable, a common *Acer pseudo-platanus* were frozen to the ground, whilst right and left of them other plants of the same species were unharmed even at the very tips of their branches. To all appearance the circumstances under which the trees were placed were precisely the same. It is very easy to say that the vitality of the three strong healthy frozen plants was less energetic than that of the others; but I would ask what is gained by so saying, and what reason is there to suppose such to have been the case?"

Now we admit that in the instances quoted it is probable enough that some agency, much less mysterious than different degrees of vitality, has caused the effects described. Such, for example, as water at the roots, or a position where the sun's rays in winter have more influence; but even if that be so, we must confess our inability to see how it can affect the argument.

It is announced by M. Guérin-Méneville that the cold country silkworm of China has at last been reared in France. It has long been known that in the land of the Manchour Tartars, in a climate at least as rigorous as our own, a kind of silk is obtained, of which very large quantities go into consumption among the Chinese. The clothes of "millions" are said to be prepared from it.

Some years since Mr. Rutherford Alcock, Her Majesty's Consul at Shanghae, sent home samples of this material, both manufactured and unmanufactured, along with live chrysalids (cocoons), but the latter perished on the voyage, and the samples were accidentally misplaced and lost in the Great Exhibition of 1851. The silk was strong, with little lustre, and resembled some strong thin yellow woollen linen. It now appears that the French have been more successful, some males having already been hatched. Of the other cocoons sent to Italy and Algiers, no account is given.

According to Guérin-Méneville, this silkworm forms a new species of night-flying *Bombyx*, of the section *Saturnia*, and is nearly related to the *Bombyx mylitta*, which produces the Tussah silk of India. But the peculiarities observable in the form, texture, and mode of attachment of the cocoons forbid the Mantchour moth being regarded as merely a northern local form of the Tussah silkworm. It is also one of the same Lepidopterous group as the Mooza silkworm of Assam, whose silk is largely employed in India, and which was described by the late Dr. Helfer under the name of *Bombyx assamensis*.

Two circumstances give peculiar interest to the introduction of this useful insect; namely, the coldness of the country it naturally inhabits, and its feeding upon a species of Oak, not on a Mulberry. The country called Mantchooria is described as mountainous, very cold in winter, and producing *furs* among other articles of trade. Oaks, Pines, Willows, Birches, Maples, and wild Roses, said to constitute the main features of its woods, are all indications of a northern climate. The Oak on which the silkworm of this remote region feeds is not clearly described. According to Mons. Isidore St. Hilaire, two sorts have been raised in France from the acorns received with the cocoons, one resembling the *Quercus castaneæfolia*, which is well known to be a native of northern China; and one of a species apparently undescribed. But it is by no means improbable that the common Oaks of this country would be taken to by the silkworms in question, and if so, the sole obstacle to the introduction of silk-growing among our rural population would be removed; and a better means than now exists of employing the women and children of the peasantry would be at once afforded.

It is right to add, upon the authority of Mons. St. Hilaire, that the interesting acquisition in question is mainly owing to the assistance given by Monseigneur Verrolles, Bishop of Colomby and Vicar Apostolic in Mantchooria, to M. de Montigny, the French Consul at Shanghae. Let us hope that some of our own people will tread with equal success in the enlightened and patriotic steps of these gentlemen.

New Plants.

134. Gardenia Rothmanni.

As a good deal of interest is attached at the present moment to the ripening of exotic fruits, a figure of that of Gardenia Rothmanni brought to maturity at Wentworth, under the care of Mr. J. Henderson, A.L.S., may not be unacceptable. The quality is not, indeed, such as to recommend it to general use; but as it arrived at great perfection, it is one instance amongst many others of what may be done in our English stoves with skill and perseverance. Mr. Henderson has for the last 20 years or more produced Vanilla in the

greatest perfection and profusion, a triumph of horticulture which can only be obtained by patient and constant attention, as every pod must be artificially impregnated.

The fruit of the Gardenia Rothmanni is about 2 inches long, obovate, resembling in general appearance that of the common brown Fig. The surface is smooth and even, with five faintly marked divisions; the colour a chocolate brown, inclining to liver-red, and by no means black, as stated by Loudon. The walls are thick, of a firm, close, fleshy, and almost elastic texture, inclosing two large cells filled with a sweet brown treacle-like fluid, and containing numerous flat suborbicular or subelliptic seeds. The flavour resembles that of a boiled Prune, with a slight terebinthous smack, and the odour, which is rather powerful, accords precisely with the taste. There is an entire want of briskness about the fruit, which in consequence can never become a favourite; and were its qualities better, the fact that it has been a year and a half in coming to perfection would be a serious drawback. It should be observed, however, that after the fruit was set, the plant was removed to a cool conservatory, a circumstance which may have made the process of ripening more tardy. A few other instances occur of edible fruits amongst the Cinchonads. *M. J. B.*

VEGETABLE PATHOLOGY.—No. LXXVIII.

328. *a.* Internal or Constitutional.—** *Organic.*—I commence with the present number the consideration of those diseases which are essentially constitutional, and at the same time induce not merely functional derangement but organic change, which is in most cases visible to the naked eye. It was stated above that those diseases which are constitutional are in all probability originally derived from external causes, and so as regards functional derangement there can be no doubt that it is always accompanied by organic mischief, though affecting structures of such delicate composition as to be beyond our powers of investigation. As before, to avoid the confusion attendant on the fact that similar appearances may arise from very different causes, I shall be obliged to depart from the strict letter of the arrangement I have laid down. So long, however, as the main distinctions are kept in view no further inconvenience will arise than that with which the author has the most reason to be discontented, namely a want of unity or systematic effect. No useful end, however, can be gained if perspicuity be sacrificed to mere neatness of arrangement. When the whole is completed a systematic arrangement will be given, in which each disease will appear under its distinctive head, with proper references, where it has been thought preferable to describe it in association with a similar disease arising from different causes.

329. Plants whether exogenous or endogenous, to whatever size they grow, and however complicated may be the organs of fructification, are mere repetitions of the primary whorls* of leaves. There are subordinate organs, as prickles, hairs, glands, &c., which may answer specific purposes, but which are not essential to the genus. The component leaves of these whorls are subject to many modifications, and the various forms of flowers and fruit arise from such modifications, combined with the increase or suppression of the members of each whorl. A greater number therefore of the leaves than usual may undergo a modification into stamens, pistils, carpels, &c.; or these essential organs may revert to the condition of leaves. If the object of the cultivator is to have fruit, his harvest may be impaired by abortion, distortion, and other evils, or if ornament is the point in view the reversion of multiplied petals, &c., to their original form, may lead to equal disappointment.

330. The consideration of every abnormal form separately would be quite out of place in the present publication, and would prove tedious to a large portion of our readers, who can hardly be expected to enter warmly into an examination of every consequence deducible from the morbid or abnormal appearances assumed by plants. The facts are so numerous and various that Meyen proposed to devote a distinct volume to their consideration, but was prevented by death from accomplishing his object, a matter which is the less to be regretted, as it has been taken up by Moquin-Tandon, who has published his observations in a volume entitled "Éléments de Tératologie Végétale" (Paris, 1841), or in other words, a history of vegetable monstrosities. Though, however, I am not prepared to describe or discuss every abnormal condition comprised under the familiar name of monstrosities, it will not be inexpedient to enumerate briefly the several heads under which they may be comprised, and the more so, because there is no better way of becoming acquainted with the structure of plants than comparing abnormal conditions with those which are normal, and ascertaining the relations they have to each other, and the systematic import of such multiplications or subtractions as may exist in abnormal flowers. The consideration of monstrosities, when unaccompanied by preconceived notions, will indeed often afford an explanation, where all other appliances fail. The true nature, for instance, of the placentation in Cloveworts is clear enough when studied in connection with such monstrosities as have been represented in this Journal in vol. 1855, p. 280, and vol. 1850, p. 612. It is to such conditions that we are indebted for our distinct apprehension of the nature of stamens and the divisions of the carpels. But supposing even that these might have been understood by mere comparison of the different organs in different plants in their normal condition, the nature of ovules must have remained an impenetrable secret without such cases as the foliiform carpels of the common white Clover, which leave the matter beyond doubt, as does the conversion of ovules into carpels in the case of the *Sweet William* and *Carnation*, adverted to above. *M. J. B.*

CORREA "BRILLIANT."

This high-coloured variety was raised by Mr. Gaines, of Battersea, and is certainly one of the best kinds of Correas in cultivation. It has a striking effect in the greenhouse during the winter months. Its propagation is easily effected, either by cuttings, grafting, or inarching. C. alba being a hardy variety, with a vigorous habit of growth, is preferable as a stock. The short-jointed pieces of the young wood, in a half-ripe state, are selected for cuttings, planted in sandy peat, covered with a glass, and placed in a close, cool situation for about a month, and then removed to a very gentle bottom-heat, they will root freely. When the cuttings are obtained early in the season—but unless plants are placed in heat this will seldom be the case—it will be

* This word is used here in the same sense in which the several convolutions of a spiral are called its whorls. It is the more necessary to advert to this because the word is used by Lindley (Int., v. 1, p. 315) in its more ordinary botanical sense when speaking of the same subject in reference to Brongniart's paper in the old series of "Ann. des Sc. Nat.," v. 23, p. 225. The ovules, of course, belong to another category, and are adventitious buds. It is not to be supposed that there is any analogy between pollen grains and ovules, though the latter are sometimes produced from anthers instead of the former, as in the gourd figured by me in *Gardeners' Chronicle*, 1851, p. 499.

easy, with ordinary management, to have them rooted, potted off, and established in 4-inch pots previous to winter; and in case that the cuttings are not fit for potting singly early in autumn, it will be better to keep them over the winter in the cutting-pot. When potted off, whether during autumn or spring, it will be necessary to keep them rather warm and moist till they have become established.

In February, or early in March, place the young plants in a moist temperature of about 50°, and keep them properly supplied with water. As soon as they commence growing, examine the state of the roots, and shift into pots two sizes larger such as require more pot-room. Water must be very carefully administered for a week or two after potting, and the soil, as well as the ball of the plants, must be in a proper state as to moisture when potted. If these important although apparently trivial matters are rightly attended to, the young plants will soon burst into vigorous growth, and should be allowed a free circulation of air during bright warm days. It will probably be necessary to regulate the growth by pinching-out the points of any over-luxuriant shoots, so as to secure a compact habit of growth. The Correa, like many other hard-wooded plants, grows freely in a moist and moderately warm atmosphere; but when kept in a hot and dry temperature, the young wood becomes prematurely ripened, and ill health ensues. Perhaps the equal temperature and moist atmosphere most congenial to the growth of the plant is more easily secured during the summer months in a cold frame than elsewhere; but the removal must be carefully effected, and the plants should be kept freely supplied with air for a time, previous to the change, and the frame so managed as to maintain the temperature and atmosphere sufficiently warm and moist to prevent them sustaining any check. During summer, a slight shade on the forenoon of bright days will be highly beneficial, and the plants should be sprinkled over-head night and morning. Air should be freely admitted, except during the occurrence of cold drying winds, when the lights should be raised at the back only, and the temperature kept down by means of shading. When the nights become warm, the lights may be thrown off late in the evening, and again replaced to protect the plants from the intense heat of the sun's rays during the day. The stronger-growing specimens may require a second shift towards August or September; and this should be attended to as soon as the pots are full of roots. Discontinue the forenoon's shade early in September, and gradually expose the plants to the sun's rays and the freest possible circulation of air, merely guarding them from heavy rains and autumn frosts. They should be removed to an airy part of the greenhouse about the middle of October, where they may remain during the winter, and will require no further attention than a supply of water and protection from frost.

When they have done flowering, any straggling shoots should be cut back, and the plants may be treated this season as recommended for last; or, if rapid growth is not particularly desired, they may be removed to a sheltered warm situation out of doors, instead of to a cold frame; but if they have been excited into active growth by a close, moist atmosphere, they must not be rashly exposed to the drying winds and bright sunshine which frequently occur in May. When greenhouse plants are removed to the plant-ground, they should be placed in a shady situation, and gradually prepared for full exposure to the sun and air. During summer they must be freely supplied with water, and a sprinkling over-head on the evenings of bright days will be beneficial. When the nights become cold, or drenching rains occur, they should be removed to the greenhouse, and be there freely exposed to sun and air. If it is desirable to have a portion of the plants in flower early in winter, they should be placed in the warmest end of the house, and kept as close as circumstances will permit. If treated thus, and if the young wood was properly matured, the plants will speedily be covered with bloom; and if they are properly supplied with water, they will continue in full beauty for many weeks. It will be unnecessary to place them in heat after the desired size is attained; but if the early-flowering plants are induced to start into growth early in spring, they will be ready to blossom early in winter, and by these means a long season of floral beauty will be easily secured.

All Correas will be found to thrive in a soil composed of three parts fibry peat, and one part light sandy turfy loam, with a free admixture of silver sand. The peat and loam should be carefully broken up into small pieces, divested of all inert soil and grassy litter, and carefully intermixed with the sand; and a sprinkling of clean potsherds, broken rather small, will assist to secure perfect drainage of the mass after the decay of the fibre has taken place. In potting, the soil should be made rather firm about the old ball, and should be in a proper condition as regards moisture when used. The plants will flower more abundantly if they are potted late in the season; and, unless they are allowed plenty of root-room, their blooming season will be comparatively short; but those who are partially unacquainted with the culture of pot-plants will act a wise part in resting satisfied with a moderate display of floral beauty rather than to risk potting their plants late in the season.

With an annual shift, and attention to the simple hints which I have just laid down, this Correa will remain many years in perfection, and, by its abundant display of blossom during the winter months, will well repay the trifling care which its culture requires. When the plants become too large to be conveniently shifted, it will be better to throw them to the rubbish-heap, and to supply their places with young plants, as if kept after they become pot-bound, they seldom flower satisfactorily. *Alpha.*

THE INFLUENCE OF HEAT ON THE PROGRESS OF VEGETATION.

(*Concluded from p.* 421.)

1. *Phases of Vegetation.*—Very early in the course of our inquiries we ascertained the curious fact that in the valley of the Rhone a smaller sum of temperatures is required to ripen Wheat than in the north of France; but that the Rhone Wheat had much shorter straw, and was made up of a fewer number of joints than the other. At Lougan on the Don, the straw is so high that an ostrich can scarcely see over it; but the sum of the temperatures is very much greater. In Siberia Barley ripens with a less sum of degrees than in the south of Europe, but in the former country the return is only three and a half fold, and the Barley, therefore, produces but a small number of spikelets in each ear, whilst in France the return is eight or nine times the quantity of seed sown. The above circumstances appeared to show the direction which our inquiries ought to take, and we determined to examine separately each of the stages of vegetation, commencing with the production of joints and then to compare each stage with the temperature.

The bud and the seed are alike an undeveloped plant. Both have a peculiar life distinct from that of other individuals of the same species. Both are rudimentary branches. Both contain, wrapped one within the other, the series of joints which when developed form a branch. Each joint growing within the sheath containing it disengages itself in its turn from the centre of the bud, and the formation and development of a joint may be regarded as an elementary stage in the life of plants. In the first place, therefore, we determined to compare the duration of this stage with the temperature accompanying it. The tables accompanying the memoir show the results of observations made on the Mulberry in 1840 and 1854 with this view.

One year with another we obtained 66 joints on a shoot from the stock of a hybrid multicaul Mulberry, and the number of degrees was always nearly the same, viz., 58.5° and 58.4° for the production of each joint. A shoot proceeding from a secondary branch pruned nearly down to the stock gave only 44 joints, each of which required 87.7° for its growth, although the shoot was almost vertical. If, however, the shoot inclines 50° from the vertical we obtain only 24 joints, each of which requires 161° of temperature. The vertical shoots of the top of old Mulberry trees pruned in the spring have 27 or 29 leaves each, developing with from 133° to 143° of temperature.

It thus appears that, 1, temperature has a direct influence on the development of each joint; 2, the development of each joint requires pretty nearly the same number of thermometrical degrees; 3, the more vertical the branch the fewer is the number of degrees; 4, the number of degrees increases as the obstructions to the flow of the sap to the bud are increased; 5, temperature does not act on the bud itself, but on the sap which nourishes it, and the growth of a bud results from the movement of the sap caused by temperature and, the temperature being the same, the flow of the sap to the bud is quick in proportion as its passage is short, direct, and unobstructed.

The joints, however, are not of equal length, and their length does not depend on the influence of heat, but on the quantity of sap which finds its way to the plant, and which varies with the dryness and moisture of the earth. This is at once evident if attention be paid to the hygrometrical state of the soil; after rain the joints elongate, after drought they shorten. A table for the year 1844 shows that in each month the length of the joints varied with the temperature and moisture of the atmosphere. It is, besides, known to every one that rain makes plants grow; a dry season gives short spare hay, whilst after wet the crop is good.

A similar set of observations was made on the Beet-root. The root has as many concentric circles as there are spirals of leaves. In our first experiment we obtained, from April to October, seven concentric circles and seven spirals each of seven leaves; the sum of degrees of temperature was 3618, or about 100° per joint. But the accumulation of matter resulting from the abundance of sap is not regulated by the temperature. From the 1st of April to the 20th of Sept. Beet was obtained weighing on an average 0.75 kil. During the dry summer months there was a check, but on the 25th of October the roots weighed 1.05 kil. The 0.75 kil. were obtained with 3108° of heat and dry weather, whilst the amount of 0.3 kil. was obtained with 510° under the influence of the rains of autumn. Again, Beet-roots unchecked in their growth and placed in a soil constantly damp (*frais*), acquired a weight of 3.5 kil. under the influence of 3618° of heat. We must be careful therefore to distinguish increase of size from production of organs; the latter depends on temperature, the former on richness and abundance of sap.

2. *Flowering.*—It is not absolutely necessary to the life of plants that they should flower. Peas sown in a highly manured soil ran into branches and leaves, but did not flower. In the hot damp countries near the equator Wheat does not ear, but yields so many stems and leaves as to be cultivated for fodder. Humboldt states that on the sides of the Cordillera of Vera Cruz, near Acapulco, Wheat is not cultivated for its grain at a less altitude than 1200 or 1300 yards. MM. Edwards and Colin could not succeed in obtaining grain from a winter Wheat sown at the end of April; but the small spring Wheat and the still smaller seed of the small winter variety sown at the same time both yielded ears of corn. On the other hand Wheat is cultivated for its grain in the Isle of France almost at the level of the sea where the winter temperature is not below 26° Cent., and is higher than that of Xalapa in Mexico, where Wheat does not ear. M. Codazzi has seen Wheat fructify in the valley of the Aragua, along with sugar and coffee. M. Bremacker placed some Lilac stocks in a dark cellar, in order to produce sleep artificially, and then removed them into earth in a hothouse, where the temperature was moderate, and kept very constant, but the plants ran to leaf and would not flower.

The experiments of MM. Edwards and Colin shows that a large albumen disposes plants to produce leaves only, just like the fertile soil in the case of the Peas, whilst the less developed albumen of the spring and poor winter Wheats yields ears, as happens with a less rich soil. In M. Bremacker's experiment, the constant moisture of the hothouse following the dampness of the cellar was also followed by nothing but leaves. We might thus expect to find a very moist atmosphere on the Mexican side of the Cordilleras, and a succession of moisture and dryness in those parts of the torrid zone where corn ripens. At all events it is clear from the above facts that flowering is by no means indispensable to vegetation, and that a plant which receives an abundant and continuous supply of sap is more inclined to run entirely to leaf than to produce flowers.

3. *Ripeness of Seeds.*—In the first place it is necessary to ascertain what is meant by ripeness. Some say fruit is ripe when it is ready to fall; others require the pericarp at least to be dried and the albumen to be completely hardened; others again allow fruit to be ripe when the seed is so far advanced that it can be made to germinate. This is ripeness in a botanical sense, and is the only sense in which the word can be used with precision. The period for gathering does not depend on ripeness; for example, the Olive is either gathered or allowed to fall, according to the purposes for which it is wanted. Grapes are gathered when they are more or less ripe, according to the object the grower has in view, the results expected from fermentation, and the composition of the must, so as to suit the tastes of his customers. In Burgundy the Grape harvest is later now than formerly, whilst the contrary is the case in the south of France. As regards Beans, it is usual not to cut them until the pod is dry, but the farmers in the Valais, who desire to keep the stalk unchanged, cut them as soon as the scar of the seed is black, although the rest of it is still green. Wheat seed has been proved by M. Duchartre to be capable of germinating when the albumen is still almost milky, and that germination was strikingly facilitated by the drying and shrinking (*rétraction*) of the corn. Without, however, going so far as this, it is certain, from experiments made at Versailles and La Saussaie, that corn may be got in without inconvenience when the top of the stem is still green, and that the grains are then finer and more valued in the market. This sufficient ripeness is from nine to 13 days earlier than what our farmers call complete ripeness, and gives a sum of at least 245° of temperature.

There is another difficulty met with when an attempt is made to fix upon a sum of degrees of temperature as necessary to enable a plant to arrive at maturity; namely, the difficulty arising from the great number of varieties which mature, some faster and some slower than others: this is the case with corn, Maize, Potatoes, Grapes, &c. We cannot therefore admit that ripeness in its common sense, which is so arbitrary and changeable, is a natural phase in the life of plants; we must confine the term to its botanical sense above explained, concerning which we know very little, and leave the rest to the convenience of cultivators.

CONCLUSIONS.

1. The successive phases of vegetation are marked by the development of elementary organs, namely, joints and their appendages, stem, leaves, buds, &c.

2. The development of the joints is determined by a sum of degrees of temperature, which is nearly constant for the same species, and for branches whose position is alike.

3. An indefinite number of leafy joints may be produced and yet the plant not flower.

4. The number of such joints varies with the climate and the year.

5. The flowering, and the number of leaf-bearing joints which precede it, depend on the different circumstances which diminish the abundance of the sap in the shoot, or which thicken it by compelling it to take long or numerous indirect passages.

6. As the meteorological conditions which influence the sap—viz., the moisture of the soil and air, rain, wind, &c.,—are, on an average of several years, pretty nearly the same in the same climate, plants flower with tolerable regularity after having produced the same number of joints. We are thus enabled to calculate for a given climate the sum of degrees of temperature which lead to flowering in the same climate, although this number may not hold good for another climate where the number of joints which precede the flowering is no longer the same.

7. Fructification and ripening being the consequences of flowering, the sum of degrees necessary to them also varies with the climate.

8. The time of harvest being always dependent on

economical considerations, and not always coinciding with the time of maturity in the botanical sense, cannot be made the subject of exact calculations as to temperature.

9. Solar radiation being also nearly constant in the same climate, if it be added to the temperature of the air the relation between the sums of temperature is not changed; but it is changed if passing from one climate to another. This heat, added to the temperature of the air, ought to be taken into account when the possibility of cultivation in a given place has to be ascertained. *Comptes rendus.*

Home Correspondence.

Garden Irrigation.—On a former occasion I cursorily noticed the use made of a tank for water in foreign gardens for the purpose of irrigation. The increased adoption in this country of the system on a large scale to farm lands, suggests its application to the garden, which is generally foremost in all minute improvements. An abundant and conveniently placed supply of water is of itself of first consequence; and there is, moreover, such a prospect of an increased produce as to induce owners of gardens to have it brought in on a regular system. I will note down what occurs to me on the subject. The sources of supply of water, and the best means of bringing it in are the first consideration. If it can be got so as to fill a cistern at a higher level than the garden wall, it will be best. It will in many cases be proper to consider the supply in connection with the house, particularly if the sewer can be taken to the garden, in which case the water is returned with interest, and the same level or the same power might be made to serve both house and garden. Very few houses are fully supplied with water beyond the every day requirements, while in the case of fire or flushing the drains provision is seldom made. The supply may be obtained from springs, small streams, ponds, or drainage, and rain-water might be collected to help other sources. The quality of the water should first be investigated. The reservoir, of course, should be in proportion to the space to be irrigated, and the nearer the garden the better, as water may be conveyed to the cistern in open cuts, but in most cases it must be in pipes from it to the garden. If the reservoir can be made in the ground and well puddled with clay it is the best; but generally one requires to be made of iron, slate, or wood; and at the back of the garden wall, forming the roof of some shed, appears to be a very suitable position. Both ingenuity and taste will be brought into play in arranging the cistern or reservoir. If mixings of manures are to be made it would be well to have a second cistern for the purpose on nearly a similar level; a small stage, and steps to it, will be necessary. The most efficacious method of applying artificial manures will probably be found to be to let on the water between the plants, then apply to each its modicum, and again the water. The high level gives the command of the water for wall trees and standards, as well as of every part of the garden; and if it be necessary to use labour to force up the water at all, it will save it by sending it up at once to the necessary height. If the supply is just above the level of the garden the foreign fashion of a brick tank with sluice and open gutters, having a projecting roof over it supported by pillars, around and over which creepers and flowers are trained, will answer most purposes, and form an ornamental object. The main pipe from the reservoir should be of ample size and be laid along the most central part, and from it branches will be carried into the chief compartments of the garden; cocks with screwed nozzles have to be placed at frequent intervals, to which hose can be attached, and thus a stream can be directed to any part of the garden. The pipes should be laid at the sides of the walks and out of the reach of spades. They would be the better for being placed in some non-conducting substance. When the supply of water is below the level, means must be used to force it up. A small steam engine is the best, unless you are favoured by a stream to drive a small water-wheel. But both the various other purposes to which the steam-power might be applied, and the means of heating afforded by the fire and boiler seem to indicate that the engine is preferable. When the water has to come any considerable distance in pipes, air vessels are necessary to ensure a regular flow. In the whole arrangement there need be nothing complicated, but it will be safer to obtain the advice of some one conversant in such matters, than to trust to the plumber or gardener, however well informed in their own immediate departments. *F.*

Pampas Grass.—Observing many inquiries during the past year for information respecting the locality of the Gynerium argenteum, I wrote to a friend in Monte Video, desiring him to collect me some of the seeds, and I have now the pleasure to state that I shall receive a supply by the first ship from that place, when I shall be most happy to distribute them. This plant is not, however, to be found in the neighbourhood of Monte Video; but is very abundant on islands in the rivers Uruguay and Parana, or in the extreme southern part of the province of Buenos Ayres. It is most luxuriant in a rather wet soil. *Thomas S. Woodcock, Manchester, June* 26.

Gigantic Cucumbers.—We forward a brace of Cucumbers, Lynch's Star of the West, grown by the Earl of St. Germains' gardener, and we should feel obliged for your opinion respecting its merit. *W. E. Rendle and Co., Plymouth.* [Of these one was 24 inches long, 9 ins. in circumference, and weighed 3¼ lbs.; the other was 22½ inches long, 7½ inches in circumference, and weighed 2 lbs. 12 ozs. Both had the flower on the end. The flesh was solid and excellent, and the surface so even that scarcely any waste took place in paring them.]

Popular Natural History.—The more elementary a work may be upon any subject, the more scrupulous ought the author to be in the correctness of his teaching. An advanced scholar may detect an error and avoid it, but a beginner is not always able to do so, and false knowledge is worse than no knowledge at all; you lose the time occupied in gaining it as well as in unlearning it. Till late years books published on natural history were notoriously disfigured by the marvellous; "I have heard" usurped the place of "I have seen." Nor are modern works entirely free from these objections. I have no pretensions to the critic in natural history; but when I meet with a statement which will not bear investigating by the ordinary process of analogical reasoning, I set it down as untrue until I see reason to change my opinion. Some time ago I spent an afternoon in the Zoological Gardens, Regent's Park. To economise time I purchased the sixpenny guide book having a plan of the gardens. This, by-the-bye, I would recommend every stranger to do who wishes to save his legs and his time. Subsequently, in turning over the pages of this book, I met with the following passage:—"Here also will be found the brush turkey of Australia (Talegalla Lathami), the representative of a limited but most singular group of birds, which are inhabitants of Australia, New Guinea, and a few of the adjacent islands of the Indian Archipelago. They are all remarkable, like the brush Turkey, for the great strength of their feet. The peculiar function to which this structure is directed is discernible in the history of their reproduction. Instead of making a nest, they scratch together enormous mounds of leaves and earth, in which they bury their eggs, to be matured by the heat of fermentation. As soon as the chicken leaves the shell, it excavates a way to light by means of its strong and well-developed feet; and then, it seems, the mother bird, guided by unerring instinct to await this moment, receives her young, and commences the actual duties of parental care." Now, does any body in their senses believe this? Fancy a young bird just warm from the shell, with tender feet and legs, scratching its way out from under an "enormous" mass of fermenting leaves and earth! But further comment is needless. Though the able secretary's name is on the title page no one will do him the injustice to believe that he wrote this passage. It would, however, have been well if he had corrected the proof-sheet. While on the subject of natural history I may allude to a statement in a recent part of the "The English Cyclopædia," in the article on the Pheasant, in which Mr. Selby is quoted as saying "that the bulk of the garden Tulip is an article of diet which the pheasant omits no opportunity of obtaining, and which, however deeply buried, the bird is almost certain to reach by means of its bill and feet." Now I happen to live in one of the best situations possible for testing the truth of this. My house is close to, in fact in the midst of a pheasant preserve. In the front is a small lawn, on which in the spring of the year, and in fact at almost any time, in the morning several pheasants may be observed picking among the Grass; and so tame are they that, much to my cost, they can with difficulty be driven away. On this lawn, for two seasons, I had a bed of Tulips; but not a bulb was touched by the pheasants. Many a time have I seen three or four fine fellows around the bed; both when the bulbs were recently planted and when the leaves were just peeping from the soil, and, in fact, at all stages of their growth; and I am sure that if the birds had any great liking for Tulip fare they would have helped themselves. I have, I am sorry to say, but few things in my garden, culinary or otherwise, that pheasants or rabbits will not readily eat; but I can safely say that Tulips are among the exceptions. *G. W. L.*

Paulovnia imperialis—The flowering of the Paulovnia in this country is now likely to become a common occurrence. You mentioned its having done so this season in a recent Number of your Paper, and I have lately seen a specimen some 20 feet high in the grounds of H. Kingscote, Esq., at Sandgate, with flowers fully expanded, and there are others in this neighbourhood. A sight of the plant mentioned suggests the propriety (especially for small places), of growing it more in the form of a bush, that its beauty and fragrance may be more accessible. In all probability age is all that is required in order to secure a yearly supply of bloom in favourable localities. The small extra degree of heat during last autumn does not appear to me to sufficiently account for the unusual supply of blossom this spring; at least, I would claim for the unprecedented dryness of the preceding 18 months some of the merit of producing such a result, and would press its consideration on such as have the charge of valuable collections, the condition of the plants under their charge as regards moisture being in a great measure in their own hands, while that relating to heat is altogether beyond their control. Perfect drainage, high or surface planting, benefit by the dryness thereby conferred, and might be carried still further by rendering (during the rainy season at least) the ground for some distance around valuable specimens waterproof, feeling assured that (as in the case of Vine borders, &c.,) the trouble would be amply repaid by the production of firmer wood, that would be easier ripened, and less liable to be acted upon by frost. The severity of the past winter has here produced some strange effects. The Pinus canariensis, Juniperus Bermudiana, and Viburnum japonicum, at best doubtful characters, have escaped and are growing freely, while double and common Furze bushes are killed to the ground. *J. M. Fo[illegible]*

A Country Gardener's Visit to London.—I have sometimes thought that a great part of the botanical knowledge in and about London is kept as it were in a strait-jacket. No doubt many a working gardener, like the writer of this article, has found much pleasure in botanical studies after the labours of the day are over, and would be glad of any opportunity within his reach to increase his small stock of knowledge. When I visited London some time ago, I hurried about from place to place, as my time there was of short duration. One day I came to what might be called a triple inclosed garden, namely, a hedge, a paling, and the police inside. I saw tallies with scientific names upon them, but it would defy them that ran to read them, and it would be a little dangerous at times to be peeping through an opening or making long necks to ascertain what they told the passer by; but I thought there would be a free passage somewhere, and that I would come out a better informed person than when I went in; but when I came to a wide entrance I found that it was too narrow for me to enter. I was told that it required a written order from a member, and that there were more than a thousand of them; but I might as well have sought for a lost needle in a truss of hay as found one of them. It was of no use telling that I was a stranger from Scotland, that I was a gardener whose stay was to be short; I mentioned names, the reply was "Not at home." They appeared to be as closely shut up as the cotyledons of the Windsor Bean in its leathery integuments. I turned about not very well pleased, thinking upon the dog Cerberus with three heads, the fabled keeper of Pluto's palace, wishing no doubt that Auld Nick would not be at home when any poor wight came near his dwelling, and I felt somewhat vexed at the thought that I would get more botanical knowledge within a ring fence on a Scotch moor than I could obtain from a metropolitan botanic garden. I got more easily into another garden, which I learned after I got within was Kensington Gardens. We are told somewhere that George Don, by order of the Commissioners of Woods and Forests, correctly named the trees and shrubs supplied to St. James's Park and Kensington Gardens. I ventured to speak to one man who was examining the state of the tallies in the arboretum. I expected to get some information from him on the subject about which he was employed, but he confessed that he knew nothing at all about botany; he told me, however, that it was the best arboretum in England. I had my doubts, however, about the statement, and thought that a person so employed, who knew nothing about botany or the naming of plants, might soon derange the best named collection of plants in existence. My next disappointment was at the British Museum. I purchased "a hand-book guide for visitors," and glancing over the divisions of the book my eye caught "Gallery of Natural History," which I found was in five divisions; the first on the list was the "Botanical Museum." In that noble building, with its rich collections of the works of God and man, there is much to attract the attention of those who visit it for the first time, and the statue of Sir Joseph Banks and the portrait of Sir Hans Sloane put one in mind of the botanical museum; but my search for it was something like the gentleman who was seen poring over the map of the world for the kingdom of Lilliput. After some lost labour, and by turning to my guide-book another time, I was told that the "Botanical Museum" was still incomplete and not open to the public. *P. Mackenzie, W[illegible] Plean.*

Oak Grafted on a Willow.—I have been informed by a gentleman who has lately been in France that he saw in the garden of Le Petit Trianon a grafted Oak tree, the stock of which was said to be Willow, and that it was done by Napoleon I. I wish to know whether you think this possible; and if you have no certain information, I beg the favour of an inquiry through your columns. *J. J. M., Leysters.* [Surely you do not believe in such a preposterous absurdity. Your friend should be less credulous.]

Mistletoe on the Oak.—Speaking to Dr. Jenner, the discoverer of vaccination, of the Mistletoe of the Oak, and remarking that I had never seen that plant but on Apple trees and sometimes on the Hawthorn and Mountain Ash, he said he had seen one and only one growing on an Oak in the forest of Dean, in Gloucestershire. Dr. Jenner was, as is well known, a very accurate observer and good naturalist; he considered its rarity and uncongenial habitat the cause of its being considered sacred by the Druids. *One of your Readers.*

Morphology.—I enclose two specimens of the cones of a Larch in my plantation, which is covered with cones in a similar condition, *i.e.*, having young shoots growing out of their tops. I do not know whether the phenomenon is very unusual or not; if it is perhaps you may think it worth while to notice it. *John F. Moor, Romsey.* [Such cases are not uncommon. They are curious proofs that the cone of a Fir tree is a stunted and metamorphosed branch.]

Stocks v. *Scions.*—Allow me to ask your scientific and practical horticultural and floricultural readers the following questions. 1. Would a wild Thorn or Crab grafted with an Apple or any other fruit produce any or sufficient shoots, suckers, or wild undergrowth, to destroy in any unlimited period of time the growth of such graft, and resume its original nature, if entirely neglected and left to its own growth in this or any other

climate, and without the clearing away of any shoots, suckers, or undergrowth? [Certainly in many cases, probably in all.] 2. The budding of Roses being upon the same principle, will time and neglect have the same effect with the wild Briar and in this climate? [Yes.] As this is a very interesting subject, would you pardon my introding further and asking the name or names of the authors who have specially written on this subject (I have lately read something on this subject, but cannot recall where), because it implies not only the power of the wild and natural production over the cultivated, but also the principle that the native growth of any clime may not be encroached upon by human power, except so far as continued attention sustains and assists the development of the indigenous child of one climate after having been grafted or budded on that of another climate. That in fact Nature reassumes its sway after the meddling human hand ceases to sustain what it has created by uniting plants by either budding or grafting. The question is the principle, and whether the laws of Nature have been fully explained on this point. *An Inquirer into Natural Laws, Brixton, June* 18. [We do not recollect anything specially written on this subject. But the truth of the replies we have given is matter of common notoriety. The wild stock will always overcome the scion, in course of time, unless artificial means are taken to prevent its doing so.]

Societies.

Linnean, *June* 19.—W. Yarrell, V.P., in the Chair. Professor Bentley exhibited several new materials for the manufacture of paper, as well as the papers made from them, and made some observations on their peculiarities. Dr. Berthold Seemann exhibited a specimen of the Pipitzahuac (Dumerilia Alamani, Db.) together with some crystals of a golden metallic hue extracted from its roots, and called in Mexico *Oro vegetal*, or vegetable gold. It was stated that this new organic acid, which had been extracted by Mr. W. Schaffner and Prof. Leopold Rio de la Loza, possessed medicinal properties similar to those of jalap, and is soluble in ether. The following papers were read.—1. A memoir "On the Larvæ of Coleopterous Insects," by J. O. Westwood, Esq. 2. The continuation of Dr. Hooker's memoir "On Balanophoreæ."

Caledonian Horticultural, *June* 9.—Premiums were awarded on this occasion as follows, viz.:—To Mr. Fowler, gr. to J. Macmurray, Esq., for Cattleya Mossiæ and Leschenaultia formosa; 2d to Mr. Ritchie, gr. to A. Duncan, Esq., for Pimelea decussata and Eutaxia myrtifolia. Cape Heaths (in 8-inch pots).—1st to Mr. Lockhart, gr. to R. Dundas, Esq., for Erica ventricosa coccinea, E. ventricosa hirsuta rosea, E. ventricosa densa carnea, and E. Coventryana. Cape Heaths (in 11-inch pots).—1st to Mr. Fowler, for E. ventricosa alba tincta and perspicua nana; 2d to Mr. Ritchie, for E. odorata rosea and Bergiana. Pelargoniums.—1st to Mr. Forrest, gr. to W. Anderson, Esq., for Gulielme and Forget-me-not; 2d to Mr. Cameron, gr. to S. Hay, Esq., for Pictum and Forget-me-not. Pelargoniums (in 6-inch pots).—1st to Mr. Henderson, gr. to C. K. Sivewright, Esq, for Magnet, Emily, Beauty of Montpelier, and a seedling. Fancy varieties.—1st to Mr. Forrest, for Countess of Ross and Annette; 2d to Mr. Cameron, for Decora and Lady Flora Hastings. Fancy ditto (in 6-inch pots).—1st to Mr. Forrest, for Lady Hume Campbell, Jenny Lind, Lady Downes, and Jehu Superb; 2d to Mr. Henderson, for Goliah, Decora, Advancer, and Eminent. Cinerarias (in 8-inch pots).—1st to Mr. Walker, gr. to J. Mood, Esq., for Angelique, Lady Hume Campbell, Marianne, and Rosy Morn; 2d to Mr. Crombie, for Lady Gertrude, Lord Stamford, Ayrshire Lass, and Picturata. Calceolarias.—1st to Mr. Mitchell, gr. to Lady Keith, for Sir G. Warrender, Rob Roy, and Nelson; 2d to Mr. Ritchie, for Bass Rock, Acantha, and Uncle Tom. Pansies (nurserymen).—1st to Messrs. Downie and Laird, for Monarch, Royal Standard, Countess of Strathmore, Father Gavazzi, Miss Talbot, Sulphurea splendens, Argo, Fearless, Miriam, Flower of the Day, Alpheus, Lord Raglan, Sir C. Napier, Marchioness of Bath, Sovereign, Lady Emily, Lord Dunfermline, Miss Walker, St. Andrew, Alice, Nonpareil, Duke of Sutherland, Charles Cowan, and Sir J. Cathcart; 2d, to Mr. T. H. Douglas, for Mrs. H. B. Douglas, Satisfaction, Earl of Mansfield, Flower of the Day, Duke of Norfolk, Minerva, Admiral Dundas, Aunt Chloe, Emperor, Royal Visit, Nox, Countess of Strathmore, Sovereign, Jubilee, Marchioness of Bath, Medora, Sultan, Glen Beauty, Sir John Cathcart, Velvet, Great Britain, Miss Walker, Unique, and Argo. Best 12 blooms (practical gardeners and amateurs).—1st to Mr. Reid, gr. to W. Wilson, Esq., for Yellow Climax, Jeanie, Miss Talbot, Sovereign, Alice, Queen of England, Mary Taylor, Royal Visit, National, Jubilee, St. Andrew, and Royal Standard; 2d, to Mr. Henderson, for Royal Standard, Sir C. Napier, Nonpareil, Lord Palmerston, Father Gavazzi, Earl of Mansfield, Monarch, Beauty, Charles Cowan, Jubilee, Bride, and St. Andrew. Best specimen of a Hardy Herbaceous Perennial.—1st to Mr. Mitchell, for Dielytra spectabilis; 2d, to Mr. Falconer, gr. to Mrs. Fraser, for Saxifraga pyramidalis picta. Alpine Plants: 1st, to Mr. Falconer, for Ramonda Pyrenaica, Astragalus uralensis, Dianthus alpinus, and Smilacina bifolia; 2d, to Mr. Mitchell, for Campanula pulla, Arenaria ciliata, Primula sikkimensis, and Stachys corsica. Messrs. Dickson and Co., prize of one Guinea, for Calceolarias, was awarded to Mr. Ritchie, for Bass Rock, Acantha, Nelson, Empress, Sultan, and Uncle Tom. Among Extra Productions there came from Messrs. P. Lawson and Son, Abelia floribunda, Weigela amabilis, Berberis Darwini, B. Jamesoni, B. macrantha, &c.; from Messrs. J. Dickson and Sons, Clematis lanuginosa and Rose Vicomtesse Decazes; from Messrs. Cunningham, Fraser, and Co., Cantua dependens; from Mr. R. T. M'Intosh, Rhododendron javanicum in flower; from Mr. R. M. Stark, Viola stipularis, Sedum Crimense, and a new species from Sikkim, Whitlavia grandiflora, Escholtzia tennifolia, with Ferns, and variegated herbaceous plants; from Mr. Methven, Boronia Drummondi; from the garden of I. Anderson, Esq., were the semi-double Rhododendron fastuosum, and several novelties from north-west America; from Dr. Paterson, Deutzia gracilis; from W. Hunt, Esq., bloom of Rhododendron Dalhousiæ, from a plant on its own roots; from Captain Peat, R.N., R. javanicum with three trusses of flowers. Mr. Aitkin exhibited a fine dark seedling Pansy named Sir Colin Campbell, which was considered a decided improvement upon St. Andrew, and to which a First-Class Certificate of Merit was granted. Mr. Crombie exhibited eight good seedling Calceolarias—one of which, No. 4, with dark ground and gold pencilling, was considered of exquisite form and superior to any of its class; and a First-Class Certificate was accordingly awarded for it. Messrs. Macpherson & Son exhibited specimens of hydraulic or Roman cement, which was stated to be applicable to garden decoration, especially in forming fountains, vases, &c., as well as walks and pavement. Mr. Alexander showed specimens of paper and rope made from Hollyhock stems by Mr. Niven's patent process. The exhibition was enhanced by plants from the Society's collection, among which was a new species of Phacelia, raised from seeds sent home by Jeffrey, the collector to the Oregon Association.

Notices of Books.

The Angler and his Friend, by Dr. Davy (12mo, Longmans, pp. 306), is one of those pleasant gossiping volumes which are the delight of piscatorial wanderers. The learned author overflows with knowledge of his art, and is eager to impart it to his companion Amicus, with whom the book is a perpetual conversation. The instructions for fishing in Connemara, Donegal, Shropshire, and Westmoreland, are evidently those of one who knows every inch of his ground, who has himself fished those waters, and whose advice is that of personal experience. The style in which advice is conveyed may be judged of from the following account of the weather most favourable to the angler. Amicus wishes to know what is to guide him in that respect, when the following conversation ensues:—

"Piscator. In complying with your request, I shall do little more than disclose the poverty of my knowledge.

"Amicus. First, if you please, speak of the waters,—the state of which is appreciable by the eye, and respecting which, I apprehend, there can be little doubt or mystery.

"Piscator. I will mention its least favourable state, whether of lake or river; and this is its waxing—a state necessarily connected with rain, and continued rain. Then the water is more or less foul; and, being foul, affording food below the surface in worms and larvæ washed from the land, is on both accounts unfit for fly-fishing. The opposite state is, perhaps, the most auspicious; that is, when the water is waning, clearing, but not quite clear, and the adventitious food is carried away by the stream or expended, and the fish are on the alert towards the surface for insect prey. If in such a state of river or lake you see the swallows haunting any particular part, skimming along the surface, there you can hardly do amiss to follow their example, and whilst they are taking water-insects you probably will be successful in taking fish. The connection I need not point out.

"Amicus. I infer from what you say, that neither a very high state of the water nor a very low one is inviting to the angler,—that is, for fly-fishing, to which I intend honourably to restrict myself.

"Piscator. As a general rule, it holds good; but, as a good deal depends on the average size of the stream, if its volume after drought is sufficient, it does not follow that there need be a want of sport; indeed, there may be very good sport, other circumstances favouring, but to secure this you should use all your art and the finest tackle, on account of the clearness of the water.

"Amicus. Now, if you please, as to the mysterious atmosphere.

"Piscator. A pretty general experience seems to prove, as I think I before observed, that when the electricity of the atmosphere is disturbed, when, to use a vulgar expression, 'there is thunder in the air,' there is little chance of good sport; a state commonly denoted by heavy drops of rain, if there be any, or by diffused, low, leaden-coloured clouds, under which the artificial fly is easily seen. This circumstance is held by old salmon-fishers to be of special bad omen. I will not tire you with other prognostics, at least of bad luck. You will in good time learn them yourself, so far as they can be learnt. Pleasant exercise being one of the chief objects of angling, and the charming view of the honest and beautiful face of nature another, it is well not to be over inquisitive about the signs, whether of good or bad sport. It is well to go out for recreation with faith and hope, and with a meek and contented mind; and, judging from my own experience, there will then be little disappointment. One pleasant general rule I can lay down, which is, that the more agreeable the weather, the fitter for exercise and enjoyment in the open air, the better the chance commonly of sport; as when you have

> 'The sweet south,
> That breathes upon a bank of violets,
> Stealing and giving odours;'

when the honey-bee is busy and far from home, when the swallow is skimming lake or river, in brief, when the air is soft, warm, and genial, and if high, still of the same genial character, the opposite of bleak, chilling, and cold."

From this the dialogue proceeds to the laws of fishing, the seasons, and local regulations, concerning all which the best advice is given to the inexperienced.

Garden Memoranda.

Horticultural Society's Garden, Turnham Green.—Among flowering plants in the curvilinear stove were some beautiful specimens of Achimenes and Gloxinia. The former are grown in pans about 9 inches wide and 4 inches deep, a plan which answers better than pots, as in this way they can be had in larger masses, and are therefore more effective. What is called on the continent Hoya coccinea was also in flower here; it appeared to be merely a variety of H. carnosa, with a little more colour in it; Canna Warzewiczi, likewise in this stove, is a pretty plant of the kind, with red-edged leaves and brilliant crimson blossoms. It was raised from seeds sent to the Society by Mr. Skinner. Crinum amabile, in the little aquarium at the end of this house, has produced a noble head of flowers, and on the roof above it Ipomœa rubro-cærulea was very gay. Among stove climbers few are more handsome or showy than this.

In the greenhouse adjoining this stove were some beautiful hybrid Cacti, the result of crossing the white Cereus crenatus with C. speciosissimus. The mules thus produced possess colours varying from vivid crimson to pale salmon, and they are much more manageable than speciosissimus, being flat-stemmed moderate sized growers, like the white female parent. We also remarked here an extremely well flowered plant of Mitraria coccinea which, when seen in good condition as this was, is really very handsome.

In the little greenhouse near the carpenter's shop the new primrose-leaved Campanula (C. primulæfolia) was in flower, and a very handsome kind it is. It somewhat resembles the pyramidal Campanula, but is even more stately, its stems rising between 3 and 4 feet in height, and beautifully clothed with purplish lilac blossoms. Associated with it was a noble specimen of Pelargonium lateripes, an ivy-leaved Cape kind; and in the same house, which was altogether very gay, were some fine bushes of the small yellow-flowered Calceolarias rugosa, integrifolia, and angustifolia.

In the large stove at the end of this house were Hamelia suaveolens, a slender growing shrub, on the ends of whose branches were clusters of yellow tubular flowers, which although not very bright are certainly not unhandsome, and they serve to produce variety. A Begonia here raised between acuminata and fuchsioides was also worthy of notice. Its flowers are not so brilliant as those of the Preston Hall hybrid, but this is in some measure compensated for by their being produced in great abundance, and the plant is so stately in habit that it shows them off to great advantage. For this excellent variety we are indebted to Captain Trevor Clarke, a fellow of the Society.

The Rose house was just in perfection on the day of the last garden exhibition, and we need scarcely add was the admiration of all who inspected it. Since then portions of the flowers have been removed and the shoots themselves have been trimmed in a little with the view of inducing them to break afresh, and be in good bloom again on the 11th of July when the next fête takes place. Nothing can be more satisfactory than the way in which the Teas and Noisettes, with which this house is planted, have succeeded. They have already as we have noticed been loaded with large and beautiful blossoms, and there can be little doubt that they will yet produce a second crop equally good as the first.

In the great conservatory Brugmansia Knighti is literally covered with white trumpet-shaped sweet-scented flowers; the red kinds are also well furnished with blossoms, and altogether this house is at present extremely gay, the side shelves being profusely decorated with showy plants, among which the most effective were noble bushes of Calceolaria rugosa. This well-known but useful variety is worth the attention of all who have houses of this kind to keep "dressy." It should be treated very much like Scarlet Geraniums. We also remarked here nice potfuls of Schizanthus retusus, a showy annual at this season.

In the Orchard-house Strawberries in pot on the beds have set and ripened good crops, although in 5-inch pots and far from the glass, and Pears, Peaches, and Nectarines have plenty of fruit on them for the size of the trees. Plums are so thick that they will require a liberal thinning, and Cherries are equally satisfactory; the Kentish kind is fully coloured. Gooseberries are loaded with fruit, and so are Black Currants, while Red ones are beginning to colour. This house may, therefore, shortly be expected to be extremely interesting.

Among Cucumbers Empress of the French has proved a good long black spined variety, and very prolific. We also noticed a sort raised from Chinese seeds; it was smooth skinned, with a few white spines on it, and very

long in the neck. In the same house were an Australian Water Melon, which is being grown here (in a pot set in a pan of water, and surrounded with Moss) with a view to test its qualities, together with the Turtle Soup Bean, a running pink-flowered sort, and a white-flowered American Bean, of similar appearance, which is stated to be a great favourite all through the Southern States. This last was given to the Society for trial by Mr. Frederic Rowe.

Plants of the Chinese Yam (Dioscorea) have been put out of doors, under hand glasses, but the weather, until lately, has been too cold for them to make much progress.

In the Kitchen Garden are some excellent Cabbages, the best of which is perhaps Dancer's, but Cock's is about equally good. Both are the Fulham Market Cabbage. Peas, late and early sorts, have just been sown, with a view to prove which is best for a late crop. Some of the January sown lots were fit for table quite a week ago. The Early Emperor came in first; it is rather before the Early Warwick, which is a little behind Dan. O'Rourke; the latter does not appear to be different from Mr. Sangster's No. 1. Early Surprise, Beck's Eclipse, Dickson's Early Favourite, and Prize-taker are only yet in flower, although they were sown at the same time as the above. Among very dwarf varieties Beck's Gem is the earliest; it is now in fruit, while Burbidge's Dwarf Eclipse, and Bishop's Long-pod, all sown on the same day, are only just in flower. Hairs's Dwarf Mammoth is also later than Beck's Gem. Pois Michaux Petit, or Paris Market Pea, appears to be the same as our Early Warwick. Peas sown in pots in February, forwarded a little under glass, and then planted out, came in a week before kinds sown in the open ground in January. They do not, however, afford so many gatherings; but then a week's earliness in the first of the season is an object not to be overlooked.

As regards Lettuces, we have to report that May's Magnum Bonum has proved to be the same as the Black-seeded Alphange Cos, a large good Lettuce for summer use, and not so apt to run to seed as some Cos Lettuces.

In the Orchard there is every appearance of good crops, though Pears are dropping a good deal. On the night of the 20th inst. there were 2° of frost by the radiating thermometer. New stakes have been procured from Mr. Montgomery's saw mills for the young espaliers. They are inch-square deal, and painted over with pitch as far as they are inserted in the ground. Stakes of this description are better than rough ones with bark on them, as the latter are apt to harbour insects.

It will be seen how backward the season still is when we state that no Strawberries have yet been gathered from the open ground.

FLORICULTURE.

THE CHRYSANTHEMUM.—I have proved the following to be a most successful method of producing really magnificent specimens of this favourite flower. I insert my cuttings under hand-glasses on a cutting bed, in time for them to be sufficiently rooted to enable them to endure the operation of transplanting by the first week in July. I plant them out in beds previously manured with plenty of well rotted dung, setting them in rows 1 foot apart, and as much between the plants. After they have grown sufficiently large to require staking, and which they will have done in about a month after planting, they are neatly tied to stakes, which I contrive to be as near as possible the height to which the plants are likely to grow; at the same time I apply a layer of dung the depth of 3 inches, or thereabouts, to the surface of each bed. This, while it protects the roots from the effects of continued dry weather, furnishes the plants during every shower of rain with a copious supply of liquid manure, which wonderfully accelerates the growth, and imparts to the foliage that dark green massive appearance which is so indicative of vigorous health. Beyond tying the plants occasionally as they require it they may be left to themselves until the first week in October, when they should be taken up and potted firmly in pots of sufficient size to suit the ball. As a rule I never attempt to remove the plants until the buds are fairly set; it is, therefore, advisable to defer potting the late flowering varieties until the end of October. After potting the mould in each pot should be saturated with water, and care should be taken on all subsequent occasions to give the plants plenty of water, and if this is well attended to they will not flag or drop their foliage. Treated in this way the time the plants are confined to pots is limited to the shortest possible period, and never present that starved leggy appearance which they frequently exhibit when they are grown long in pots. When the amount of labour expended in watering is taken into account, together with the frequent drawback of the plants producing diminutive and partially developed flowers, the advantages of the above plan will be apparent, especially when it is recollected that, with scarcely a tithe of the trouble, the cultivator will be in a condition to command a first-rate supply of well-grown and finely furnished plants in every respect worthy of the name, richly studded with flower buds. The true colour, size, and shape of the flowers may also, with comparative certainty, be depended upon. The practice of growing the Chrysanthemum in pots appears to have been founded on the generally received opinion that, in order to obtain a good show of flowers on young plants, it is necessary to confine the roots to pots proportioned to the size of the plants. Cultivators disposed to give the two methods a fair trial will, however, I am persuaded, acknowledge that the Chrysanthemum does not make such a bad use of its liberty as to render it imperative to put artificial restriction on its roots; on the contrary, strong healthy plants, be they ever so young, will flower freely and very much finer when grown in beds, and are in every respect very far superior to the best Chrysanthemums that can be produced in pots. *R. M.*

NATIONAL FLORICULTURAL SOCIETY, *June* 21.—At this meeting Calceolaria Yellow Standard received a certificate of merit; it is a neat profuse blooming shrubby sort, with bright canary-coloured flowers. A similar award was also made to Calceolaria Orange Perfection; these came from Mr. Cole, of St. Alban's. Phlox Celestial, from Mr. Lochner, was not sufficiently in flower for its merits to be determined. A fine specimen of Verbena, Mrs. Woodruff, was contributed by Mr. Robinson, the raiser of Defiance; its flowers are very large and brilliant. Several other Verbenas were staged, but they were considered to be no decided improvement on existing sorts.

SEEDLINGS.

GLOXINIAS: *T D.* 1, is the best; its colour appears to be richer than that of most dark purple sorts. The others are too small.

Calendar of Operations.

(*For the ensuing week.*)

PLANT DEPARTMENT.

CONSERVATORY, &c.—The Camellias and Azaleas for early flowering which have set their buds should be removed to a shady sheltered situation out of doors, as if kept in heat too long after they are fairly set for bloom they will be apt to make a farther effort at growth, which would cause them to bloom weakly and irregularly. Give careful attention to maintaining a succession of plants for the decoration of this house during autumn and early winter. A portion of the stock of the Lilium lancifolium should be placed in a shady situation to retard their blooming till late in autumn, when they will doubtless be acceptable, and there should be a good stock of Fuchsias coming slowly along in a cool house or a shady situation out of doors for autumn flowering. Attend to the stock of Chrysanthemums, also Salvia splendens, Tree Carnations, &c., and afford them pot room, &c., as may be requisite, and endeavour to secure well grown stock specimens of these and everything else. Selago distans is a capital plant for winter blooming, requiring merely a cold pit to grow it in, and keeps in flower an unusually long time, and is well deserving of attention. But we must still depend principally for a winter display upon our old friends the Camellias, Epacris, and the winter blooming Heaths, and these should all have every necessary attention and care, and should be largely grown where there is a large demand for flowers in winter, and do not overlook Mignonette and a good stock of Cinerarias.

FORCING DEPARTMENT.

VINERIES.—Attend to keeping cool and moist where the fruit has been cut in order to preserve the foliage in a healthy state as long as possible. The laterals need not be kept very closely stopped after the fruit is cut, but they must not be allowed to shade or injure the principal foliage. If there is any appearance of red spider give the foliage a good washing with the engine directly the fruit is cleared off, and repeat this as long as there is a vestige of the enemy to be seen. Give prompt attention to the thinning of the fruit in succession houses, for like many other jobs this is most easily and expeditiously done when taken in time. Look well to the state of the borders where the fruit is swelling, and give a thorough soaking of tepid, good strong manure-water wherever the soil is found to be at all dry, and aim at having the borders in a healthy state as to moisture where the fruit is about colouring, for a healthy root action has more to do with the colouring of the fruit than many persons seem to suppose. Young Vines planted out this season should be encouraged to grow freely, and as the roots will be near the surface see that they are not allowed to suffer for the want of water, and in the event of hot drying weather a slight mulching over the roots would be useful. Do not keep the laterals too closely stopped, as the more leaves, &c., the Vines are allowed to make the more freely the roots will run in the border, and this deserves attention the first season.

PEACHES.—Spare no pains to maintain a moist state of the atmosphere where the fruit is swelling, syringing freely, and shut up early in the afternoon, but give air sufficiently early in the morning to prevent the least risk of scorching.

FLOWER GARDEN AND SHRUBBERIES.

With few and comparatively short exceptions the weather has not been sufficiently warm for the bedded-out stock making rapid and vigorous growth, but so far everything seems to keep perfectly clean and healthy, and is growing slowly. Watering must still be well attended to, especially where the soil is of a light dry nature; and as the roots are yet near the surface, this should not on any account be neglected a single day after the plants begin to feel the want of moisture. Where the soil is of a stiff tenacious character, it will be advisable to give a thorough soaking when watering is necessary, as frequent waterings on soils of this nature cake and harden the surface to a most injurious extent; and as soon as the surface soil is sufficiently dry after watering, it should be lightly broken up, using a short-headed rake with short blunt teeth, or a small Dutch hoe, and taking care not to injure the roots. Get annuals thinned before they grow into and weaken each other, for if left to stand too thick they never flower finely nor make half the display of plants that are afforded plenty of room and grown strongly. The early flowering bulbs, as Tulips, Hyacinths, &c., should not be left in the ground after the decay of the foliage, as if wet weather occurs they will make fresh roots, which weaken and injure the bulbs.

HARDY FRUIT AND KITCHEN GARDEN.

The bright warm weather which we are now enjoying will cause the Peach and other trees to grow away freely, and on light shallow borders watering may be necessary, and if so use water that has been some time exposed to the sun, mulching lightly with rotten leaves to retain the moisture as soon after watering as the border will bear treading. Weakly trees would be benefited by mixing with the leaf-soil a portion of good rotten dung. But where the trees are at all inclined to make gross wood mulching should not be practised. Stop any gross shoots, or remove them altogether if they can be spared, and endeavour to equalise the growth as much as possible so as to get the trees well filled throughout with bearing wood. Look to the preparation of Strawberry plants for forcing next spring, and do not allow the beds of this favourite to want for water until the fruit is beginning to ripen.

STATE OF THE WEATHER AT CHISWICK, NEAR LONDON,
For the week ending June 28, 1855, as observed at the Horticultural Gardens.

The highest temperature during the above period occurred on the 5th, 1852—therm. 97 deg.; and the lowest on the 1st, 1837, and 4th, 1841—therm. 37 deg.

Notices to Correspondents.

ASPARAGUS: *Anon.* The stems are "fasciated," a very common kind of monstrosity, usually arising from excessive luxuriance.

BOOKS: *A H.* Sweet's "Hothouse and Greenhouse Cultivator." —*Vina.* Saunders on the "Pot Culture of the Vine." ‡—*G D.* Lindley's "School Botany" was written expressly to remove all such difficulties. The general truths of vegetable physiology are briefly enumerated in the last edition.—*R L.* Mills on the "Culture of the Cucumber and Melon."—*D & Sons.* We have just received Carrière, *Traité général des Conifères*, an 8vo. volume which seems to be what you are in search of.

DISEASES: *A B C.* The Peaches are affected with the common Peach mildew. Either apply brimstone with a dredging box or syringe the trees with a properly diluted solution of Grison's mixture, the receipt for which will be found in our volume for 1852, p. 419. *M. J. B.*

LABELS: *Liverpool.* Letters of various sizes with which to punch names on sheet lead may be had of any considerable ironmonger.

LABURNUM SPORTS: *J C.* This is the common and well-known Cytisus Adami, concerning which consult the "Theory of Horticulture," last edition, p. 358.

LAWNS: *Constant Sub.* The mowings and sweepings make good manure when mixed with leaves, and constantly soaked in "house-slops" of *any* kind. But they are some months rotting down, and are apt to become offensive unless sprinkled from time to time with peat charcoal or some other disinfectant. It mixed with stable manure so much the better.

MEALY BUG: *Beginner.* Perhaps the best mode of getting rid of this pest is continual brushing, sponging, and washing, with a mixture of tobacco water and soft soap. ‡

NAMES OF FRUITS: *R A.* Your Apple is a sort of Nonpareil, like Braddick s.‖

NAMES OF PLANTS: We have been so often obliged to reluctantly decline naming heaps of dried or other plants, that we venture to request our correspondents to recollect that we never have or could have undertaken an unlimited duty of this kind. Young gardeners, to whom these remarks more especially apply, should bear in mind that, before applying to us for assistance, they should exhaust their other means of gaining information. We cannot save them the trouble of examining and thinking for themselves; nor would it be desirable if we could. All we can do is to *help* them—and that most willingly. It is now requested that, in future, not more than four plants may be sent us at one time.—*Y., Bucks.* A Deodar and nothing else. Its seed never came from Mexico.—*J H.* Doronicum Pardalianches.—*T S K.* Calycanthus floridus.—*Kimbery.* 1, Some Acacia quite indeterminable; 4, Sinningia guttata; 5, some Epidendrum, perhaps selligerum; 2, Asclepias curassavica—*W W S.* Next week.—*J B.* Rivina lævis.—*W B.* Myosotis minimus. No second volume was ever published.—*E A.* It looks like a bit of Euonymus europæus.

OAK GALLS. *Peter Wh.* They are common Oak-apples. We see nothing unusual in them.

VARIEGATED SWEET WILLIAM: *F P.* The leaf sent is prettily striped with white. Similar variegations in Sweet William have, however, been observed before. They can only be perpetuated with certainty by means of cuttings or layers.

VINE MILDEW: *G W S.* We have no doubt whatever that the disease may be completely arrested by sulphur in all cases. You should syringe the Vines well before dusting them with the flowers of sulphur; and if the disease has made much progress, you should use the sulphur unsparingly.

WOODLICE: *T W.* A toad or two will assist you in thinning their numbers, and quantities may also be caught by placing tiles or boards over each other; they crawl between them in the morning approaches to conceal themselves, and may be destroyed. Tiles laid over Cabbage leaves likewise form good traps.‡

MISC.: *Old Sub.* Double Rhododendrons are by no means uncommon.

PEAT CHARCOAL.

THE PEAT CHARCOAL COMPANY beg to inform Agriculturists, Florists, &c., that they can be supplied with the above valuable deodoriser, fine in boxes, and coarse in sacks, by applying to their Agents, MARK FOTHERGILL & Co., 204A, Upper Thames Street, London.

PERUVIAN GUANO, Bolivian Guano, Superphosphate of Lime, Nitrate of Soda, Sugar Scum, and every description of Artificial Manures, Linseed Cakes, &c.
WM. INGLIS CARNE, 10, Mark Lane, London.

PATENT SANITARY SEWAGE COMPANY'S NITRO-PHOSPHATED CARBON OR BLOOD MANURE, 5l. 10s. per ton; delivered in London, bags included. Each ton contains 1350 lbs. Blood and 11 per cent. of Phosphate of Lime.—Agents throughout the country.
22, Lincoln's Inn Fields, London.

TURNIP SOWING.—The Undersigned beg to offer their valuable Supherphosphate of Lime (See "Royal Agricultural Society's Journal," Vol. VI., Part 2), Turnip Manure, and Nitro-phosphate or Blood Manure.

Also on sale, Guano, Nitrate of Soda, Gypsum, Bone-dust, Sulphuric Acid, Salt, and all other Manures of known value. Agents for the sale of Peat Charcoal.—Apply for Prices Current to MARK FOTHERGILL & Co., 204A, Upper Thames Street, London.

CORN MANURE FOR SPRING SOWING.
CONCENTRATED URATE FOR GRASS, RAPE, AND ALL ROOT CROPS.
SUPERPHOSPHATE OF LIME.

THE LONDON MANURE COMPANY continue to manufacture the above Manures, which have been used with so much success for the last 14 years.

The London Manure Company also supply PERUVIAN GUANO (direct from importers' warehouses), Nitrate of Soda, Sulphate of Ammonia, Fishery and other Salts, Bone Dust, and every artificial manure of known value. EDWARD PURSER, Sec.
Office—40, Bridge Street, Blackfriars.

THE FOLLOWING MANURES are manufactured at Mr. LAWES' Factory, Deptford Creek:—Turnip Manure, 7l. per ton; Superphosphate of Lime, 7l.; Sulphuric Acid and Coprolites, 6l.
Office, 69, King William Street, City, London.

N.B. Genuine Peruvian Guano, guaranteed to contain 16 per cent. of ammonia. Nitrate of Soda, Sulphate of Ammonia, and other Chemical Manures.

MANURES.—The following Manures are manufactured by HODGSON & SIMPSON, Calder Soap Works, Wakefield, and MATTHEWS & Co., Manufacturing Agricultural Chemists, Driffield. SIMPSON'S AMMONIA PHOSPHATE, a valuable Top-Dressing for Wheat, Barley, and Oats. SIMPSON'S NITRO-PHOSPHATE for Turnips, Potatoes, and all other bulbous root crops, price 8l. per ton. N.B. Manures specially prepared for Grass and Flax. The above have been successfully tested for the last Seven Years by the leading farmers in Yorkshire and Lincolnshire, and other counties, and were applied last season to a breadth of upwards of 15,000 acres of land with the most beneficial results to the crops. A List of Testimonials and other particulars will be forwarded by post on application.

SEWAGE CHARCOAL MANURE.—This highly fertilising Manure, which is Peat Charcoal completely saturated with London Sewage, will be found most efficient for every species of crop; more especially for Peas, Beans, Turnips, Mangold Wurzel, and other root crops. It will produce a greater return for the outlay than Guano or any other manure at an equivalent value: it also possesses the property of retaining its fertilising power longer than other Manures now in use. It may be obtained at the SEWAGE MANURE WORKS, Stanley Bridge, Fulham, at 4l. per ton, and in quantities less than half a ton, at 5s. per cwt., for ready money only; and in quantities not less than a ton will be delivered at the London Termini of the Railroads free of charge for cartage. No charge for sacks.

It may also be had from Messrs. G. GIBBS & Co., 26, Down Street, Piccadilly, Agricultural Seedsmen, Agents for London, and from all the other Agents of the Company.

ARTIFICIAL MANURES, &c.—Manufacturers and others engaged in making ARTIFICIAL MANURES may obtain every necessary instruction for their economical and efficient preparation, by applying to J. C. NESBIT, F.G.S., &c., Principal of the Agricultural and Chemical College, Kennington, London. Analyses of Soils, Guanos, Superphosphates of Lime, Coprolites, &c., and Assays of Gold, Silver, and other Minerals, are executed with accuracy and dispatch. Gentlemen desirous of receiving instructions in Chemical Analyses and Assaying, will find ample facility and accommodation at the College.

COLLEGE OF AGRICULTURE AND CHEMISTRY, AND OF PRACTICAL and GENERAL SCIENCE, 37 and 38, Lower Kennington Lane, Kennington, near London.
Principal—J. C. NESBIT, F.G.S., F.C.S., &c.

The system of studies pursued in the College comprises every branch requisite to prepare youth for the pursuits of Agriculture, Engineering, Mining, Manufactures, and the Arts; for the Naval and Military Services, and for the Universities.

Analyses and Assays of every description are promptly and accurately executed at the College. The terms and other particulars may be had on application to the Principal.

IMPROVED MOWING AND ROLLING MACHINE.

ALEXANDER SHANKS AND SON, Arbroath, Forfarshire, Inventors and Sole Manufacturers, respectfully solicit the attention of the Nobility, Gentry, and Gardeners to this Improved Machine for Mowing and Rolling Lawns. The Machine is in operation in the Royal Gardens at Windsor Palace, Buckingham Palace, and at Osborne, in the Botanical Gardens at Kew, Regent's Park, Manchester, Sheffield, &c.; at Blenheim Palace, Trentham, Cleveden, Elvaston, Broadlands, Woburn Abbey, Clumber, Lilleshall, Castle Howard, Shrubland, Bridge Castle, Enville Hall, Tiptree Hall, Chatsworth, and in many other of the principal gardens in the kingdom as well as in the United States, British America, and on the Continent, where its merits have been fully proved, and its success established.

The machine is made to cut the breadth of 42, 30, 20, and 15 inches respectively, is exceedingly durable, easily managed, and adjusted to cut to the length required. The execution of the work is far superior to what may be attained by the most skilful mower, while at the same time a great saving of labour is effected, and the turf much improved. By the largest machine a Scotch acre may be mowed, rolled, and the Grass collected in one hour.

A. S. and SON have much pleasure in stating that they have made considerable improvements in their 15-inch or hand machine this year, by which the draught is considerably lessened. This machine combines all the merits and advantages of the larger machines with firm and secure construction, and is admirably adapted for borders and for lawns of no great extent.

ALEXANDER SHANKS and SON also respectfully solicit notice to "Fleming's Weeding or Salting Machine" for destroying weeds in gravel walks, court-yards, drives, &c. This machine is now in operation in many parts of England, where it has given ample satisfaction as the best and most economical means of thoroughly keeping down weeds or Moss.

Further particulars, with testimonials and prices, may be had on application.

WARNER'S IMPROVED LIQUID MANURE, OR GENERAL PORTABLE PUMP.

The valve is a ball of imperishable material, and cannot clog in action. The barrel is of galvanised iron, not likely to corrode, and can be raised or lowered at pleasure. The legs will fold together, and the whole may be carried on shoulder to any pond or tank required.

Price of 4½ in. Pump, with legs, 3l. 3s. The barrel is 27½ in. long, and the legs are 5 ft. high.

1½ inch Gutta Percha Suction Pipe, 1s. 6d. per foot.

1½ inch Flexible Rubber and Canvas Suction Pipe, 3s. 6d. per foot.

May be obtained of any Ironmonger or Plumber in town or country, at the above prices, or of the Patentees and Manufacturers, JOHN WARNER & SONS, 8, Crescent, Jewin Street, London.

Every description of Machinery for Raising Water, by means of Wheels, Rams, Deep Well Pumps, &c.; also Fire and Garden Engines, &c.—Engravings sent on application.

WARNER'S PATENT VIBRATING STANDARD PUMPS.

PATENT CAST-IRON PUMPS, for the use of Farms, Cottages, Manure Tanks, and Wells of a depth not exceeding 30 feet.

Diameter of Barrel	Length of Barrel, under nose.		£	s.	d.
2½ in.	short 1 ft. 7 in.	Fitted for lead, gutta percha, or cast iron flanged pipe, as required.	1	12	0
2½ „	long 3 „ 3 „		1	15	0
3 „	ditto 3 „ 6 „		2	12	0
3½ „	ditto 3 „ 6 „		2	18	0
4 „	ditto 3. „ 6 „		3	5	0
2½ „	short, with 15 feet of Lead Pipe attached, and Bolts and Nuts ready for fixing		2	12	0
2½ in.	long ditto	ditto ditto	2	15	0

The short barrel Pump is very convenient for fixing in situations of limited height and space, for the supply of coppers and sinks in Wash-houses with soft water from underground tanks, or in Hot, Forcing, and Plant Houses; they may be fixed, when desired, under the stage.

May be obtained of any Ironmonger or Plumber in Town or Country, at the above prices, or of the Patentees and Manufacturers, JOHN WARNER AND SONS, 8, Crescent, Jewin Street, London.

Every description of Machinery for Raising Water, by means of Wheels, Rams, Deep Well Pumps, &c.; also Fire and Garden Engines, &c. &c.—Engravings sent on application.

JOHN WARNER AND SONS, Crescent, Jewin Street, London.
GALVANISED IRON TUB GARDEN ENGINE,
WITH WARNER'S REGISTERED SPREADER,

is strongly recommended, for durability and low price, viz., 2l. 19s., to hold 10 gallons.

Larger sizes in wood or iron, viz., 14 gals., 24 gals., & 35 gals. May be obtained of any Ironmonger or Plumber in town or country, or of the Patentees and Manufacturers, as also Machinery of all kinds for raising Water from any depth to any height by Steam, Horse, or Manual Power. Prices sent on application. Syringes of various constructions and sizes from 9s. upwards. Metallic String from 5d. to 1s. 3d. per lb.

JOHN WARNER AND SONS, 8, Jewin Crescent, London, Manufacturers of FIRE ENGINES, PUMPS, GARDEN ENGINES, and SYRINGES.

Brass Syringes, 9s. to 18s.

All articles of JOHN WARNER & SONS' manufacture may be obtained of any Ironmonger or Plumber in town or country, at the advertised prices.

JOHN WARNER & SONS having been practical Horticulturists for many years, know exactly the requirements of both Amateurs and Gardeners. A gardener with a properly constructed pump will get through as much work in five minutes as he could with any Syringe in a quarter of an hour, and with half the labour to himself. Syringes are economical for small houses.

No establishment offers such a variety of effective machines for hydraulic purposes, whether to supply Gardens, Hothouses, Cottages, Farms, Mansions, or Boards of Health, with every requisite connected with the conveyance and distribution of liquids.

Fountains suitable for Conservatories, Lawns, &c.
Sheets of Engravings sent on application.

BLACK JAPAN VARNISH.—This article will be found from its durability and cheapness of the greatest utility for Painting Hurdles, Wire-work, Palings, Gates, Fences, &c., and out-door work of every description, whether of Wood or Iron. Its value has been proved by the test of time. It should be well stirred up before using and applied cold. This Varnish will retain its quality for any length of time, provided the cask be kept closed.

May be obtained through any ironmonger; or of JOHN WARNER & SONS, 8, Jewin Crescent, London.

N.B. Sold in casks containing 14 or 7 gallons, at 2s. per gallon. Casks (which cannot be returned), 5s. and 8s. each.

CLAYTON, SHUTTLEWORTH, & CO.'S PRIZE PORTABLE STEAM ENGINES, AND COMBINED THRESHING, STRAW SHAKING, RIDDLING AND WINNOWING MACHINE may be seen at their London Establishment, 6, Fitzroy Terrace, New Road, where all information relative thereto can be obtained. These Machines are constructed to horn Barley, and make a perfect separation of the chaff from the pulse. They are fitted with Elevators, which deposit the grain into bags, and beyond the feeder of Machine require no hands except to take away the Corn, &c., as threshed, the whole of the operations being performed by self-acting machinery, whereby the Corn, Straw, Chaff, and Pulse are delivered in the places assigned for them.

C. S. & Co. have paid special attention to this class of Machinery, and Fixed Barn Machinery, and from the position they have taken at the Royal and all the leading Agricultural Shows of England, flatter themselves that for efficiency, durability, and simplicity, their Engines and Machines are not surpassed by any other maker in England. All letters forwarded to the Works at Lincoln will have immediate attention; and Illustrated Catalogues forwarded to all parts of the kingdom postage free.

ANERLEY POULTRY SHOW.—
President—The Right Hon. the Earl of VERULAM.
Vice-President—Sir JOHN PETER BOILEAU, F.R.S., Vice-President of the Zoological Society.

The FIRST EXHIBITION of POULTRY and PIGEONS will be held in the Anerley Gardens, adjoining the Anerley Station of the London and Croydon Railway, and near the Anerley Entrance to the Crystal Palace grounds, on TUESDAY, WEDNESDAY, and THURSDAY, August 28, 29, and 30.

The value of the Prizes will exceed 300 guineas. A detailed List of the Prizes and Certificates of Entry may be had on application to the Secretaries at the Office, Anerley, Surrey.

By Special Permission the BAND of the ROYAL ARTILLERY will attend each day during the Exhibition.

EDGAR SMALLFIELD, HENRY F. WELLS } Hon. Secretaries.

THE GARDENERS' CHRONICLE AND AGRICULTURAL GAZETTE UNDER THE NEW STAMP ACT.

IN consequence of the Repeal of the Newspaper Stamp, the price of this Journal will be on and after this day 5*d.* unstamped, and 6*d.* stamped.

An *unstamped* copy can be sent by post by affixing a 1*d.* postage stamp upon each transmission. A *stamped* copy may be sent free as often as desired during fifteen days from the date of the paper, provided the paper be so folded that the stamp may be visible.

Subscribers will please to inform their Agents whether they desire stamped or unstamped papers.

The Agricultural Gazette.

SATURDAY, JUNE 30, 1855.

MEETINGS FOR THE ENSUING WEEK.
WEDNESDAY, July 4—Agricultural Society of England.

WE have lying before us the prize lists of two annual agricultural shows—one to be held in Paris between May 23 and June 7, 1856, and the other between May 22 and June 6, 1857. It may be well for English breeders to bear in mind the extremely liberal rewards offered by the French government on these occasions. As instances we select the short-horn class among cattle, in which eight prizes amounting to nearly 400*l.* are offered, the highest being 40*l.* for the best old and yearling bulls; and the South-down class among sheep, in which prizes amounting to nearly 200*l.* will be awarded; the highest being 24*l.* The interest excited among both British and French agriculturists by the show of this year will, we think, ensure greater and more general patronage of this annual meeting by English breeders than has hitherto been accorded to it. The sum of 5000*l.* and upwards is awarded to breeding stock alone on this occasion, besides a considerable sum for machines. An application addressed to the Minister of Agriculture and of Public Works will, no doubt, procure a printed statement in detail of the particular distribution of this large sum.

On the 9th of May a paper by Mr. Horsfall, of Burley Hall, Otley, in which he described the results of his dairy management, was read before the Royal Agricultural Society of England. He had been requested, it appears, by the Council of the Society to supply information regarding his treatment of cows for dairy purposes, and the information which he gave was justly deemed worthy of a vote of thanks. The remarkable fact which his experience had presented was the extreme richness and density of the cream which under his mode of feeding was obtained, and he says that having satisfied himself that this peculiar richness was due only to the treatment of his cows, it appeared to him that these results of his dairy practice afforded matter of interest for the investigation of those who cultivate science—the physiologist and the chemist—and that he ought not to keep them to himself. So far from pretending any position as agricultural teacher such as would throw any reproach on the existing practice or on the existing theory of dairy management,

he says with perfect simplicity and modesty:—"Though my pretensions to acquirements in the instructions of these gentlemen are but slender, they are such as enable me to acknowledge benefit in seeking to regulate my proceedings by their rules." That Mr. Horsfall's acquirements are very much beyond his pretensions will have been apparent to all the readers of this Journal. The frequent papers on cattle feeding with which he has favoured us during the past season prove not only scientific but practical ability. And on this latter point we are able to say that for many years he has been engaged in farming pursuits—every detail of management being under his direct control—the object throughout of pecuniary success having been not only kept in view but successfully attained.

On the 20th June, at another weekly meeting of the Council of the Agricultural Society, a second paper on the same subject was read by Mr. Scott, of Charing Cross. It is impossible to speak too highly of the substantial, instructive, and suggestive character of Mr. Scott's communication. A great deal of it bears on the business rather of the butter merchant than of the dairy farmer; but whether in reference to the manufacture or the sale of dairy produce it is a most useful contribution to our knowledge of its subject, and will no doubt find a prominent place in the Society's Journal. If we may be allowed to write one word in criticism of this paper, it would be to direct attention to what is one of its merits in a literary point of view—the fluent confidence with which authorities are marshalled, and his own wide experience is alluded to by the writer—so that those not possessed of personal knowledge of the points which it embraces, are carried away even more readily by its reasoning than they were by that of Mr. Horsfall, which it appeared to overthrow.

The history of this discussion is completed by adding that, in a leading article which appeared on Monday last in the *Mark Lane Express*, the writer laughs at the "much vaunted *progress*" indicated by Mr. Horsfall's achievements, announces himself as the "opponent of humbug," and exclaims, "how awkwardly would that first letter have appeared in the Journal without this rider to it. How much harm might the first alone have done if allowed to appear uncorrected!"

The answer to all this outcry is simply this, that Mr. Horsfall never "promised to effect the complete revolution" in the butter manufacture which the *Mark Lane Express* seems to have feared from his communication—that the "first letter" has never been corrected, and that as a simple statement of fact it must stand, however "awkwardly" it may read.

The facts of the matter may be correctly given both by Mr. Scott and Mr. Horsfall without the inferences of the former regarding the conclusions of the latter being substantiated. It is a very hasty ill-considered decision to assert that Mr. Scott has come to "the rescue of the Society" from the conclusions to which Mr. Horsfall would have led them. It is perfectly true that it is in relation to the quantity of milk, and not in reference to that of the cream, that the produce of butter is important, but Mr. Scott was not the first to make use of that self-evident truth. The quantity of butter from the milk yielded by the cows is given in the original paper, and while the yield of butter from the cream thrown up is unprecedented, the proportion yielded by the milk is very far from being the average which Mr. Scott contends it is. We fear the writer in the *Mark Lane Express* founds his glee over Mr. Scott's conclusions upon some of that book farming which he would certainly in his cooler moments have condemned. 25 ozs. of butter from 16 quarts of milk, which Mr. Horsfall gets, would be a great step forward in dairy experience if it could be generally attained, whatever may be said in the books which Mr. Scott has quoted, and on which our contemporary relies. The "average" quoted by Mr. Scott is not the average of such cows as Mr. Horsfall uses. Most of the cows milked in the trials alluded to by Mr. Scott were Kerries, Galloways, Ayrshire, cross-bred, Irish, any of which yield richer cream than ordinary. If the short-horns and the Cheshire cows are taken for comparison Mr. Horsfall's yield of butter from the milk is one-third higher than the average of Mr. Scott.

But we are not careful to defend Mr. Horsfall from his opponent. The latter seems to have wisely followed the example given him of quoting authorities, with no other animus than the love of truth, and no one doing that shall receive anything but thanks from us.

Mr. Horsfall is perfectly able to defend himself—a letter from him in reference to the communication of our correspondent "D" will be found in another column—we do, however, protest against the injustice of holding up to ridicule, however impotently, any one who simply publishes his agricultural experience, especially when it is done at the request of the Agricultural Society.

To deepening the soil as the efficient means of an increased fertility there are many testimonies. Perhaps the most definite and valuable is that of the Rev. S. Smith, of Lois Weedon, in Northamptonshire. His evidence is valuable, both because it refers to two very different kinds of soil, and because it extends over a number of years. It has already been pretty fully discussed in these columns; we refer to it now, however, rather for the purpose of illustrating the principles of tillage than in order to commend any particular mode of farm practice. Having walked over his fields both in winter, when the process was in operation, and in summer when its results were ripened, we can speak as to the means employed, the soil on which they are employed, and the produce which rewards them. Early in July last year we saw Beans and Swedes and Wheat on a very stiff loam, which had been gradually deepened by means of the fork, latterly indeed trenched. And on a gravelly soil, in an adjoining field which had been similarly deepened, there was an abundant crop of Wheat. The Swedes were luxuriant and healthy, such as are seen ordinarily under good culture in September: the Beans were wonderfully podded: and the Wheat was the most extraordinary crop of the three. It had been Wheat after Wheat on the same soil for a succession of years: triple rows, a foot from one another, being cultivated with 3 feet intervals; these intervals, forked and cultivated during the growth of the rows on either side, being the site of the next year's crop. This alternate crop and fallow, without the use of manure, yields an average of 34 bushels per acre per annum over the whole land so treated; deep and thorough tillage thus proving to be in effect the equivalent of manure. The fact, for so after 10 years' observation it may be called, is, that by dint of deep and thorough tillage successive corn crops can be grown by bringing the mere life of the seed into connection with the stores of food for it which a tolerably stiff soil and the atmosphere together yield.

But the advantage of a deeper soil on the one hand, and of more thorough tillage on the other, is now everywhere admitted; the more general prevalence of Turnip husbandry has contributed greatly to the latter good result; and Mr. Smith's, of Deanston, subsoil plough, and every instance of cultivation such as that of Lois Weedon on a horticultural scale, and by horticultural means, have contributed to the former. And so we see that cultivators, horse-hoes, grubbers, are taking the place of those imperfect tillage implements—heavy drags and harrows; and ploughs for deeper work are made and used in large numbers. We do not add here remarks upon the obvious cause of infertility which shallowness of soil is when lying on the rock. Where plants are "scorched because they have no deepness of earth" the remedy is obvious enough, however inapplicable it may be. Pastures upon the chalk, the mountain limestone, and the millstone grit are often thus burned up in summer, and were it possible so to deepen such land, it would be seen that a couple of farms would be more productive if they could be laid one a-top of the other than they now are in their extent and shallowness.

EXPERIENCES IN LAND DRAINAGE.

No. XX.—The result of the drainage here is very satisfactory.—The parallel system has been pursued.—The depth of drains where the land is strong 3 to 4 feet; where light, with sand bottom, 4 to 5, in some cases 6 feet.—No difference has been made between Grass and arable land.—Direction of the minor drains with the fall. (The lands are mostly without much fall, being in a level country.)—Formerly before pipes were used the tiles were 3 inches in diameter with flats in sand bottom; lately 2½ inch pipes with collars in the sand bottom; without collars in the clay land; and 4 to 6-inch pipes for main drains—these mostly dispersing the water into open ditches.—It has not been found necessary to make apertures for air.—The average number of acres discharging through one main drain from 8 to 10.—The soil on part is light at top with deep sand bottom—part loam with clay marl bottom, with in some places a stratum of chalky gravel intervening of 2 to 3 feet, the marl being 6 to 10 feet deep.—And part strong surface soil, with subsoil of 5 feet of clay. Height above the sea level about 12 to 15 feet. Where the land is strong the drains are 8 to 9 feet asunder. Where light with sand bottom 12 to 15 feet asunder. I may add that the improvement in the land is quite satisfactory. *J. Geddes, Everingham, near York.*

No. XXI.—The result of our drainage operations on all descriptions of land is perfectly satisfactory, having laid down as many rods as would reach from hence to your office—76 miles.—The drainage is up and down the furrows, draining as much as possible when the land came in for winter fallowing.—As to the prevailing depth of the drains, I plough 9 inches deep and put the tile and sole 2 feet 6 inches below that, green Heath next, and then the top spit or mould.—I have made no difference in the mode of draining between arable and Grass land.—The direction of the minor drains is up and down the furrows, but I could never see any difference between the two systems where there were no springs.—I have never done any draining except under the Marquis of Tweddale's system of putting a sole to every tile. I went to the expense of erecting a machine of my own, and supplied my neighbours all round.—I have never found any benefit by giving air at places to either main or minor drains.—The average number of acres discharging at the outlets is 3 or 4 acres.—The soil and subsoil are clay, with no springs.—The geological formation is clay down 50 feet.—I have great pleasure in replying to your queries about draining. I think on my farm it has worked admirably, never having had a single drain fall in or get out of order. The modern system I cannot understand of putting in small round pipes, or throwing in the subsoil without any Heath or other loose material, or even the top spit or soil to filter. —*Edward Twynam, Allington.*

XXII.—The drainage has been quite satisfactory.—Mostly parallel, and about 3 feet deep.—I have no Grass land that requires through draining, therefore have drained according to springs and swampy places.—As to direction of drains, I have followed both plans, according to circumstances, and been successful in both: the depth has been according to soil.—I have used no collars or sockets, and generally 1½-inch pipes and 2 or 3-inch main drains.—I tried one field with air at both ends of the drain, but found no benefit.—About 4 or 5 acres on clay arable, but more on Grass discharge into one outlet.—I have found that it is much better to be ruled by circumstances of soil, fall, &c.; as to depth and distance, &c., and not to adopt one system and one depth, which, in my opinion, is complete waste of capital. —I tried one field at 4 feet 6 inches, and at a distance, to make the expense the same as more drains at less distance and depth; it failed, and I had to run drains across and above the others, some to the outlets, others were dropped down into the deep drains; top drains smaller pipes than the deep drains, done 6 years, and works well.—I have 150 acres strong clay, with chalk stones in it, that I have tried at different depths, and I certainly find that following the furrows, which were winding at about 2 feet 6 inches, and then ploughing the lands down, then cross ploughing, then askew, makes a vast improvement, and in 3 years makes the fields quite level and the apparent improvement very great. *Charles Barnett, Biggleswade.*

XXIII.—The result of my drainage operations on all descriptions of land has been satisfactory.—The drainage adopted is both parallel and with the furrows when the lands are very convex and the soil tenacious.—As to depth, 4 ft. 6 in. mains, and 4 ft. minor drains.—I have not drained much Grass land, but prefer 3 feet deep, so as not to deprive the soil of too much moisture to meet the drought in summer.—The direction has been across the fall.—Two-inch pipes have been used for minor drains, and from 3-inch to 6-inch for the mains—*i. e.*, suppose the length of main drain to be 15 chains long, I would begin the first length of four chains 6 inches, the second 5 inches, the third 4 inches, the next three chains 3 inches, and the last chain 2 inches.—I have given air to the main drains, but cannot say that I have perceived any peculiar benefit.—From 5 to 7 acres drain at an outlet.—My soil is loamy with a grey clay subsoil, interspersed with sand and gravel veins, flint, and chalk stones, *Nicholas Fisher, Milton, near Blisworth.*

No. XXIV.—Drainage perfectly satisfactory.—Parallel.—Four feet six inches deep in the furrows: in many places in going over the old high lands six feet.—I have made no difference in the mode of draining between arable and Grass land, because on my farm experience tells me it acts as beneficially in one as the other.—Our land is all hilly. I have taken the drains as near as possible at an angle of 45° up the hills, and 66 feet apart.—The pipes used have been 6 inch for the outfall of the main drains, 4 inch at the upper end of do., and 2 inches for the cross drains, but no sockets. —No benefit has been found from giving air.—From eight to ten acres drain at one outfall.—The subsoil is alternate beds of clay, then sand and gravel, and what is commonly called iron stone; the soil is light.—The geological formation is in the lower bed a strong blue clay. The upper stratum is where they are digging the Northamptonshire ironstone. *Wm. Shaw, Farcotton, Northamptonshire.*

No. XXV.—Drainage satisfactory.—Generally parallel except in some rather steep falls, where the drains have been placed more diagonally across the slope, which I in such cases prefer, or where in some cases the old furrows have been followed.—Generally 4 feet deep, in some cases 3 feet 6 inches, and occasionally in gravelly and more porous soils, 5 feet.—In heavy arable lands, which mine generally are, I do not venture to exceed 8 yards apart for the drains. I have found 9 yards too wide, and I should prefer 8 yards at 3 feet 6 inches depth to any deeper drains at wider distances. Where the ridges were narrow and high I have followed them, draining perhaps only 3 feet deep at 6 yards apart with good effect. On pastures of the same sort of soil I have found 4 feet drains at 12 yards apart the cheapest and most efficient; for though the surface is still sometimes wet after heavy rains, the state of the Grasses show that the object has been effected.—The direction has been generally down the

fall, and I have followed the furrows where they were deep or in the right position, but not invariably.—1¾ inch tiles have been used generally for mains, 2½, 3, and 4½ where required; sockets only used in sandy ground: in clay they are not required, and pipes fit better without them.—I have only attempted a direct air communication in one instance, and do not perceive any superior effect there.—At present I have not more than 30 acres discharging at any one outlet; but this might be much increased, and I am thinking of carrying on some of my smaller outlets into one larger carrier.—The soil generally clay loam and clay; subsoil clay, with occasional beds of gravel and sand, and a few stone beds. The formation blue lias.—20 or 30 feet above sea level. —Average fall of rain for the last six years about 27 inches. *J. C. Hayward, Quedgley, Gloucester.*

XXVI.—Drainage very satisfactory.—On the parallel system.—Three to four feet deep.—The same on pasture as on arable.—With the fall. Disregarding furrows.—I use stones, except in the main drains, when I use pipes without sockets or collars; two and a half-inch to 4 and 6-inch bore.—I always make an air drain.—The soil is various—peat, clay and gravel. Subsoil, clay slate.—On the Silurian formation.—Eight hundred feet above the sea, in a wet climate. *Henry H. Sandbach, Abergele, North Wales.*

No. XXVII.—My drainage has been, in almost every case, highly satisfactory.—In every case, where practicable, on the parallel system.—From 3½ feet to 4½ feet deep in tillage land, and from 4 to 5 feet in Grass land. —From 18 to 32 feet apart in tillage land, and from 28 to 40 feet apart in Grass land.—With the fall in general; but where Grass land was in wide high beds, I have preferred in every case the draining in the furrows.—From 1¾ to 3-inch tiles have been used for minor, and from 4 to 9-inch for main drains; the subsoil being in general strong clay, we have not required many collars.—I have found it very beneficial to admit air where the main drains were to carry long distances.—Not more than 10 acres issue at an outlet on an average.—The soil is in general a black loam lying on the top of yellow and blue clay.—The geological formation is clay sandstone and coal measures.—From 200 to 300 feet above level of sea.—*Stratton, Esq., Durham.*

Home Correspondence.

Dairy Statistics.—The dairy statistics given by "D." in your paper, June 23, had not escaped my attention; the number of the *Albert Journal* in which they first appeared was politely handed to me by Dr. Kirkpatrick, the intelligent principal of the Albert Training Institution. I had some thoughts of introducing it in my paper to the Royal Agricultural Council, as affording the greatest yield of butter in proportion to milk from ordinary food which had come under my notice. Finding, however, that the experiments on each variety of food had only been continued during seven days, I did not think them a safe criterion of what would be the effect on a lengthened course of observation. Mr. Cunningham, who supplied these statistics, accompanies them with the remark that they are not sufficiently comprehensive, and intimates his intention to repeat them next season. I observe these very statistics figure in Mr. Scott's communication to the Royal Agricultural Council. On examining Mr. Scott's results of butter from food, I am disposed to think that the impression they appear to have made is not altogether warranted, and shall explain my views on them through the proper channel. In the course of his observations he states that an average cow will produce 196 lbs. of butter a year, though this is somewhat more than is stated by other authorities. I am willing to admit its correctness; taking the milk on the average given in his tabulated results it would require 1957 quarts to produce the 196 lbs. of butter, and allowing a cow to produce milk 300 days in a year, which is less than my cows continue in milk, the result will be only six and a half quarts per day on the average. In my present stock of 18 milk cows there are not more than three giving so little. Still Mr. Scott observes that Mr. Horsfall's yield of milk of 10 quarts per cow per day is not more than ordinary. *Thomas Horsfall.*

Fragments.—It is singular, but not the less true, that although the hardiest evergreens which I have seen growing in some of the most favoured parts of Ireland were killed or much injured by the frosts of last winter, a large Laurel hedge growing in my garden here remained perfectly evergreen, although located very near the foot of Mount Leinster, one of the highest mountains in the province of that name. To what to attribute this escape I know not, except to the land shelter; though a facetious neighbour tells me it must have been saved by the pruning of the under parts by "the Earl of Stair's halbertmen," who were allowed "free ingress, egress, and regress" by my predecessor,* who I am told was "an estated gentleman," but who I am sure was no gardener.—Lolium temulentum is a poison, ay, and a deadly one, too, if taken in sufficient quantity, the more especially as hot food, as I have proved in my own experience. Believing, however, that Nature never yet caused a plant to grow not calculated, if properly used, to produce some good, I will now give you a few hints regarding its use and application. Some of your readers may remember having seen letters of mine written on the Island of Beglim, near Wexford, some time ago. I was located there reclaiming the mudlands for the Wexford Harbour Embankment Company. Amongst the many valuable plants produced indigenously on that fertile land the Darnel grew more luxuriantly than ever I saw it grow any where else. The Wheat grown there, though of the finest quality in Ireland at least, I could never sufficiently rid of the Darnel, and in consequence of it I was invariably "cut" in price by the millers of Wexford and Castlebridge. At last I hit on a man who, though he never read a word of the chemistry of Sir Robert Kane, Liebig, or Farraday, yet knew the value of the Darnel as well as any of them did, bought my Wheat giving me the highest price in the market, and never "cut" me. Fearing, from his "free and easy" manner that he would grind it amongst the Wheat, I told him the story of my own experience. He smiled at my simplicity, and showed me his superior "separators," and a large quantity of the Darnel and small grains of Wheat he had both ground into meal and unground for feeding his pigs, of which he had a score of them nearly 3 cwt. each snoring away in his yard as drunk as he ever was himself. His practice was to mash and lightly ferment it as an Englishman would his malt for ale brewing, or an Irishman his "Rawcorn" for poteen whisky distillation; more I need not say about it.——The Potatoes *are* diseased. I saw the disease six weeks ago, but said nothing about it then; nor would I now, had I not first seen it noticed in the *Gardeners' Chronicle*, for if I did, although it could not be denied, the wiseacres of the Irish press with few exceptions would set me down, as they so politely term it, "a croaker," in the pay of the provision merchants, seedsmen, and manure-vendors; never for a moment letting themselves believe that I regret the existence of the same disease as much as any man can, having paid more money this year for valuable varieties of seed Potatoes than has been paid by all the newspaper men in Ireland put together. *Edward Carroll, Cranemore House, Clonegal.*

Steam Power.—Permit me to make a suggestion on the application of steam power to farm purposes. The chief use of steam power on the farm has hitherto been threshing and other similar work done in the house. To these we may now add pumping, for the application of liquid manure. The best pump is probably the centrifugal, as it has no valves, and is the lightest and simplest of all pumps. It is not necessary to have one engine for threshing and one for pumping, because it is not necessary to be always threshing and always pumping; the same engine may do both alternately. It is worth the attention of our agricultural engineers and machine-makers whether an engine might be made to do either house work, as threshing and pumping, or field work, as ploughing. A locomotive may be used as a stationary engine. An engine that could do any work would evidently be cheaper at first than two or three engines for as many kinds of work; and there would also be probably a saving in attendance. *No Engineer.*

* "The Earl of Stair's halbertmen" are the goats from the celebrated Blackstairs Mountains, that come down when pressed with hunger into the lowlands, eating in their way every "green thing." See "Legends of Mount Leinster," by Barry Whitney Fitzsmath, published by P. Kennedy, Anglesea Street, Dublin.

Societies.

ROYAL AGRICULTURAL OF ENGLAND.

WEEKLY COUNCIL, *June 27th.*—Mr. MILES, M.P., President, in the Chair.

RUSSIAN CATTLE-DISEASE.—Lord Berners stated to the Council at their previous week's meeting that he had seen a notice in the "Press" of that week, of a cattle-pest in Russia of so virulent a character that the Prussian Government had interdicted the importation of cattle, hides, fat, wool, hair, and even of herdsmen, from that empire into the Prussian dominions. Lord Berners had on the previous evening named this report to the Earl of Clarendon in the House of Lords, when his Lordship at once expressed his willingness to render every service in his power in reference to a subject of so much importance to the agricultural interest of this country, and stated his intention of at once instituting the requisite inquiries by despatches to be conveyed on the following morning by a special messenger to Berlin. The Earl of Clarendon requested Lord Berners to assure the Council of the Royal Agricultural Society of England, that on this subject, and on all others which came within the control of his department at the Foreign-office, it would at all times give him the greatest satisfaction to receive and endeavour to carry out their wishes. The following communications have already been made to the Council in reference to this cattle-plague.

"Lord Wodehouse presents his compliments to the Secretary to the Royal Agricultural Society of England, and is directed by the Earl of Clarendon to acquaint him, for the information of the President and Trustees, that his lordship's attention having on Tuesday last been called by Lord Berners to an article in the *Press*, stating that the cattle plague had broken out in Russia, and that severe precautionary measures had in consequence been taken in Prussia, he instructed her Majesty's Minister at Berlin to inquire and report upon the subject. Lord Bloomfield states in reply by the telegraph that Baron Manteuffel, the Prussian minister of state, expressed his belief that measures of precaution against infected cattle had been taken by local Prussian authorities on the Russian frontier, but his Excellency was not informed as to details and would make inquiry.

"Foreign Office, June 22, 1855."

"Foreign Office, June 26, 1855.

"Sir,—With reference to my note of the 22d inst., I am directed by the Earl of Clarendon to transmit to you for the information of the President and Trustees of the Royal Agricultural Society, copy of a despatch from her Majesty's Minister at Berlin, containing information relative to the precautionary measures established in Prussia in consequence of the malady lately broken out in that country amongst the cattle.

"I am, Sir, your most obedient humble servant,

"WODEHOUSE.

"The Secretary to the Royal Agricultural Society."

(Copy).

"Berlin, June 23, 1855.

"My Lord,—In consequence of the prevalence of disease among cattle in Russia and Poland, the Prussian local authorities on that frontier have felt themselves called upon to put in vigour certain precautionary measures to prevent the spread of this malady, which they are authorised to do by the Prussian law of March 27, 1835, of which I enclose to your lordship herewith a copy in original, with a translation of the 3d Article, which empowers the local provincial authorities, in cases where the disease may appear within three miles or less of the frontier, to prohibit the importation of all species of horned cattle, as well as of any articles likely to carry infection, and I am informed that this measure has been lately resorted to by the Prussian local authorities on the whole line of the frontier. I understand from Baron Manteuffel that no case of disease has yet made its appearance in this country.

"I have, &c.,

"To the Earl of Clarendon." (Signed) "BLOOMFIELD.

(Copy).

"The above measures are to be more strictly observed if the murrain has broken out in the vicinity of the frontiers. If an infected place in a foreign country is only three miles or less from the frontier then it is positively forbidden along a certain extent of frontier, to be marked out by the provincial authorities, and in any case along the extent that lies so near to the place infected, to admit—

(*a*) Horned cattle, sheep, swine, goats, dogs and poultry, fresh skins of bullocks and of other animals, horns, and unmelted tallow, beef, dung, winter fodder, and stable implements of any kind.

(*b*) Also raw wool, dry hides, and the hair of animals (bristles excepted) are excluded, if there is reason to believe that they come from an infected place.

(*c*) Only to allow such persons to pass without molestation who, according to their circumstances, cannot be supposed either to have been in any infected place at all, or even if they have been there, in any way to have come in immediate contact with infected cattle. All persons on the contrary, who according to their circumstances, may be supposed to be occupied and to have intercourse with cattle, such as cattle and heather dealers, butchers, tanners, skinners, are refused admission, or they must, when very cogent reasons are brought forward for their admission, previously submit to a careful purification, to take place under the superintendence of the police. The provincial authorities are moreover empowered to enforce the application of these measures, even when the infected places lie *five* miles beyond the frontiers.

"This must, in every case, happen when a brisk and accelerated trade in the above-named articles takes place by means of turnpike roads or communication by water between the infected places and the inland, or when the contagion in the interior of the foreign country has spread itself to a great extent. In cases of this kind, and especially when the spreading of the contagion in the foreign country propagation makes rapid progress, or when other dangerous circumstances happen, then these measures are to be enforced, even when the disease prevails at a distance of more than five miles."

The Council evinced their deep sense of Lord Clarendon's warm and effective interest in promoting the objects of the Society, and the welfare of the agricultural community.

BUTTER PRODUCTION.—Mr. Horsfall communicated the following statement in reference to the amount of butter obtained in his dairy:—

"Burley Hall, June 21.

"On perusing Mr. Scott's paper, I find he states that a milk cow, on the average (we must adhere to average and leave out exceptional cases), produces 196 lbs. of butter a year. Dr. Muspratt, in his recent publication, states the ordinary yield of butter per year at 160 lbs. to 180 lbs. per year in England and the daily yield of butter from a cow at 8 ozs. to 9 ozs. per day, which on a yield of 8 to 9 quarts of milk show 1 oz. per quart, or 50 per cent. less than what is shown by Mr. Scott's results on 17 experiments. Mr. Rowlandson, and other writers on this subject, give a result similar to that stated by Dr. Muspratt—about 1 oz. to each quart. Mr. Scott in his paper states that 10 quarts is not more than an average yield of milk per day for a cow; allowing a cow to be in milk 300 days a year, the annual yield would be per year 3000 quarts, which I am disposed to think is not more than a moderate average on dairy cows *properly maintained.* My own cows are not allowed to be dry two months a year, and I am satisfied that 3000 quarts per year is not an over estimate of the average of my dairy cows. Now, on 3000 quarts Mr. Scott's average of butter, 196 lbs. a year, would reduce his yield of butter in proportion to milk about one third or 33⅓ per cent. and leave it very similar to what is stated by Dr. Muspratt and other writers. Mr. Scott had no right to draw the inference that my yield of butter from cream might be attributable to my butter containing a greater quantity of butter-milk, as I sent a sample of butter from a churning which I superintended personally, when five quarts of cream produced 127 oz. of butter, being fully 25 oz. per quart. The analysis of this butter has already been submitted to the Council, and will be found not to contain a less proportion of pure butter than is ordinary; in this respect it is superior to the butter of Mr. Acland, the analysis of which by Professor Way I have before referred to. Now, if I deduct the casein or curd from my butter, it will affect the quantity of butter from a quart of cream to the extent only of about half an ounce; or if I deduct the whole extraneous matter there will still be upwards of 21 oz. of pure butter from a quart of cream. This peculiar richness of my cream is surely of sufficient interest to relieve me from the charge of having unnecessarily obtruded myself on the notice of your honourable Council. The matter cannot be allowed to rest here; with your permission I shall again recur to the subject, and shall introduce some features of my treatment which are not noticed by Mr. Scott.—THOMAS HORSFALL."

Mr. Horsfall having also stated that, "if he could be informed when the subject was likely to be introduced again at the Council meeting, he might possibly attend to give any explanation required, as he felt much interested in the matter;" the Council decided, that Mr. Horsfall should be invited to attend their weekly meeting on Wednesday the 11th of July, at 12 o'clock.

AGRICULTURAL MOTIVE POWER.—Mr. Garrett informed the Council that an invention of the highest importance to agricultural operations had been made by Messrs. Boydell and Glasier, of Camden Town. A private trial of the invention was to be made on the following day; and the machinery had been entered for trial at the Carlisle meeting. He considered this invention the first virtual step that had been made towards the successful application of steam power to the cultivation of the land; and that if the results anticipated should be realised, it would in his opinion constitute one of the greatest discoveries of the day in the adaptation of steam power to the traction of powerfully resisting obstacles over broken surfaces, uneven roads, or up declivities, along which no locomotive steam-engine had hitherto been able to proceed.

Reviews.

An Essay on Hand Tillage, by Mr. Bottomley. Printed for the Wakefield Farmers' Club. C. Hicks, Market Place, Wakefield.

The Wakefield Farmers' Club adopts the useful plan of publishing, for circulation in their district, the papers read before them at their monthly meetings. The following are extracts from the tract just issued with the above title, which contains the substance of a paper on Hand Tillage, read on March 30, by Mr. Bottomley. It should be stated that in Yorkshire the term hand tillage is synonymous with artificial manures.

He said if ever there was a time more than another when hand tillage should be more in requisition, it was the present moment. At one time the low prices for their produce might well discourage them from the use of hand tillage; but now, when the markets and the corn exchange were fructified by gold dust, they would be readily induced to do everything they could to raise larger crops, because the remunerative prices would well justify the outlay. We were now at the commencement of a war, and how long it might last no one knew; but considering the suspension of foreign supplies by it, he thought it behoved English farmers to endeavour themselves to produce as much corn as possible. The Oats, of which he exhibited samples here to day, were produced by a manure he had himself made on his small farm of 50 acres. [These were remarkably fine specimens of Oats, upwards of 6 feet in the stalk, with corresponding grains.] His method of making this hand tillage was this:—He burned everything in the shape of refuse, as cuttings of hedges, dry leaves, &c., on his premises, into wood ashes, smouldering them in the fire so as to save as much carbon as he could. He then mixed with it horse and cow stale, soap suds, and soot, the ammonia from which would, as they all knew, be absorbed by the charcoal. To this he subsequently added salt, and after that gypsum, and found with the last ingredient he had no disagreeable smell from it. This was his own hand tillage which he used to every species of crop—Wheat, Oats, Barley, Turnips, &c. The last year he had got half a ton of Mr. Simpson's nitro-phosphate to mix with this. As it happened he was from home at the time it arrived, and his man instead of mixing it with other manure, went and shot it down, and began to spread it out the same as ordinary manure, which would have been rather an expensive process. Fortunately he arrived in time to prevent it being thus spread, and had it scraped together again. Wherever any of it had stood, however, it had left traces, and he believed every barrow mark might be known by the beautiful green Grass which had sprung up upon it. He was now mixing Simpson's manure with his own tillage, finding that the latter wanted phosphate. He used it for everything—grain, Mangold Wurzel, and Turnips, and had put in no guano for some years. When he found that his crops were as good as his neighbours', and that he only used this tillage, he did think there was some good in it; and it was much cheaper than either buying phosphate or bones. He had a similar crop of Oats to those he now exhibited on his farm, grown previous to using Simpson's manure, and which were so strong in the straw that they had not been beaten down by a heavy thunderstorm. He would now quote from Dr. Lindley in the *Gardeners' Chronicle*.

"Nothing must be allowed to run away in the form of a fluid, or to fly away in the disguise of a smell. Mark out a piece of ground on which the dunghill is to be made—on a good slope, if possible, and close by a pond. Cut a gutter all round, and puddle it with clay, so as to make it water-tight. Then at the lowest part, outside the place where the dunghill is to lie, dig a sink-hole 18 or 20 inches deep; let this be well puddled and connected with the gutter already spoken of. Things being thus prepared, throw down a layer of manuring substances about a foot deep; tread them well down and scatter some fixer over it; finally, water it well. In this manner go on with layer after layer, till the heap is the desired height. During the operation of making the heap some water will have drained away: in that case it will have run into the gutter and been collected in the sink-hole. Scuppet the water out as the work proceeds, and throw it back on the dunghill. If the hole is not large enough, another must be made near it; none of the drainings must on any account be lost. It should have, at least once a week for a month, a good quantity of fluid thrown upon it. Pot boilings and soap-suds are much better than common water; but urine is preferable to both. By these contrivances nothing is allowed to leak, and the dunghill becomes a soft mass, holding fast all which belongs to it except what flies away. To catch the latter is the purpose of the fixer. There are many fixers—oil of vitriol, green vitriol, blue vitriol, salt and lime (not either salt or lime by themselves on any account), gypsum, &c., may be used; but some of them at all times, and in some cases all of them, have the fault of costing money. A substitute which costs nothing except labour is, therefore, to be sought for. Such exists in cinder siftings, charcoal dust, good black earth, peat or bog mould, rotten sawdust, leaf mould, black mud from ponds, bottoms of wood stacks, brick dust, burnt clay, &c. Some or all of these may be had in most places."

Mr. Bottomley then went on to say that he had had no practical experience in farming till he had come into that neighbourhood, and had had therefore nothing to unlearn, which was so often more difficult than to learn. He was ready to examine every new invention in agriculture which he might hear of; and though he was not prepared exactly to believe in all those theories of which they had heard, yet he thought theory and practice working together was a very excellent thing. He should particularly recommend to his younger friends the study of Johnston's "Catechism of Agricultural Chemistry and Geology." In that work they would find, among the rest, much useful information on the subject of manures, and of their application to different kinds of crops. In reference to the sample of Oats he exhibited, this sample had been grown on Wheat stubble, with nothing but his own hand tillage, produced on his own premises. Some of these Oats were 7 feet high in the straw. He had been one of the judges at the Huddersfield agricultural show, and had there sold some of those Oats at 2*l.* per quarter; and he believed it was in every man's power in that room to grow as good, whether he farmed 50 acres or 500. He understood from Mr. Johnson, who had been cutting timber, that he had been using charcoal made from its refuse branches, and had better crops than his neighbours in consequence. The first thing, in making his hand tillage, was to obtain carbon, after which the other ingredients might be mixed with it. If any gentleman present would come over to his place he should be happy to show it them in process of making for application to Barley, Mangold Wurzel, Swedes, and other crops, and they would then see the manner in which he had built up the straw as well as the top of those Oats.

"Mr. Cooper agreed with Mr. Bottomley's views. He could himself recommend every one to read 'Talpa' ['Chronicles of a Clay Farm,' from which Mr. Bottomley had quoted], a book he had perused several times, and should again.—Mr. Bottomley said, 'Talpa' was something like 'Sam Slick.' It walked into the farmers and their old prejudices in good style, and every farmer ought to read it.—Mr. Charlesworth did not think such Oats as those shown by Mr. Bottomley could be grown every year. There was one thing in them which he had never seen before in his life, and would give 10*l.* to know what would produce it regularly. He had seen it in other grain, but never before last year. He meant the fine glossy matter on the straw, which he had never seen during the 40 or 50 years he had been connected with farming till last year, and should like to know what would produce it. Mr. Bottomley said, his impression was it was the salt produced it. Mr. Charlesworth: No; it was the season. They wanted something to produce this gloss every year. In Scotland it was said this gloss arose from the use of sea weed. Mr. Bottomley remarked that there was saline matter, which confirmed his opinion. Mr. Nicholson said that he farmed rather largely, and he thought his tillage bill, amounting to some 600*l.* a year, was a large sum to take out of a Wheat crop. He should like to know what would be the position of Mr. Bottomley, if his farm cost him a proportionate sum in manure. It was certain that artificial manures of a saline nature greatly improved crops. Last year, had used Mr. Simpson's manure for corn crops, and had found them much improved by it. Some of his neighbours used some of it for top dressing with the same results, their crops being much better where that manure was employed. He had understood Mr. Bottomley to say that chalk land did not require chalk as a manure, but in Lincolnshire chalk lands were found to derive much benefit by the use of seven or eight tons per acre. Mr. Brakenridge said, in Mr. Bottomley's description of his process of making his tillage, and mixing the ingredients together, he thought that in some respects they were mixed too late. Gypsum, burnt clay, and sulphuric acid, were all fixers of ammonia, and might be all used with more or less advantage to that end. He had no doubt that the use of nitro-phosphate had a good deal to do in producing the strength and glossiness of straw displayed by the sample of Oats before them. Thought the application of lime to land deficient in that material would produce great effect, though there was no kind of land but would be benefited by such application, There were not many soils but what had much silica in them, and the application of lime was the best means of dissolving it. He concurred in Mr. Bottomley's recommendation to the agricultural interest, relative to the application of scientific knowledge in their pursuits, and had himself derived much benefit from it. The Secretary said he was sure that an immense amount of good tillage might be made by every man on his own farm, though he would not go to the length of thinking every farm might be made absolutely self-supporting. Still it was for every farmer to take care of every morsel of clipping and other refuse, since there was no portion of such rubbish which might not be converted into hand tillage. If they made the best of the tillage they themselves produced, they would not want so much of Mr. Simpson's nitro-phosphate. It required no great amount of intellect to do this, but just a little common sense. Farmers were never accused of thinking too much; but if they would think a little more on these matters they would be all the better for it. The Chairman said the meaning of the term, strictly speaking, was something which could be distributed in small quantities by hand, not brought by a cart load, but in smaller quantities—such as could be carried up a hill for instance, and would combine the essence of farm-yard manure with saline ingredients. After noticing the relative qualities of the carbonaceous, gaseous, and inorganic matters contained in ordinary manure, he remarked upon the subject of the application of lime to limestone lands, which had been a subject of controversy in the course of the discussion, that it was proved by analysis that many soils had lime below the surface, but none on it. Such being the case, it might be highly serviceable, in an agricultural point of view, to apply lime in such instances, since there might possibly be none within that depth of soil to which the roots penetrate. When lime was put to land it was generally used in a quick or caustic state. The advantage was that the caustic alkalies of the lime dissolved the silica. He thought the caustic alkali of the lime, while it dissolved the silica, would contribute in part to the glossiness of the outside straw, which had been noticed by Mr. Charlesworth. Another effect of lime was to make the silica soluble. It was most used either in a powder or a solid state, but must be made liquid to produce the best results. He thought, when so used, that the watery part in the process of evaporation left some of the solid part upon the straw, producing the gloss before mentioned, while it was further proved that the use of lime made the straw stand up better. As a proof that one effect of lime would make the straw stand up, he had used on a part of a field common fold manure, and on another part quick lime, and found that in a heavy storm the first part was laid, while the remainder stood up. He had no doubt the same beneficial effect would be produced on the grain as on the straw. The next point he would refer to was the use of salt as a tillage, one of the good results of which was that it protected the crop from the ravages of the grub. He had a field of 15 acres of Clover lea, on 5 acres of which he put salt, on 5 more lime, and the remainder nothing. He found that the lime answered best, the salt next, while the grub took the other five. Mr. Bottomley had been asked by Mr. Scarth what were the proportions for mixing his tillage. He took 1 ton of gypsum, 1 ton of salt, and soot *ad libitum* to the ashes. The expense of 10 loads of ashes he did not consider anything, because he should have to dispose of it in some way under any circumstances."

Letters to the Farmers of Nottinghamshire on the Chemistry of Manures. By Samuel Parr. R. Theobald, Paternoster Row.

Some of these letters have already appeared in our columns. The whole are collected together here in the form of a little pamphlet, which deserves perusal for the simple and generally satisfactory treatment which it gives to such subjects as theory of manures, liquid manure, farmyard manures, bones and superphosphates, guano, lime, gypsum, fallows, &c. The letters were originally printed in the *Nottinghamshire Guardian*. We give the following extract as a specimen of the author's style. It relates to the policy of bare fallows:—

"In bringing stiff clays into cultivation, a naked fallow once in eight years, or even less, may be advisable; but when once the soil has been brought into good heart, a naked fallow is the worst possible mode of agriculture, provided the land can be kept clean without it. A naked fallow ought, therefore, to be looked upon as a necessary evil, and should be borne with as such, and then only upon heavy clays. It may be asked what are the principal means by which fallowing may be superseded? This may be accomplished by deep drainage and deep cultivation, by liming, by the burning of clays, or, where the land is perfectly clean, by a green fallow crop. Thorough draining will rid the soil of all aquatic weeds, and render it more porous, consequently more accessible to the influences of the atmosphere. Lime will be instrumental in dissolving the alkaline earths and silicates. The silicates of alumina, &c., contained in clays, might be digested in an acid (such as oil of vitriol mixed with a little water) for several weeks, without producing any appreciable results; but after these earths have been mixed with lime, and then digested in an acid solution, they will assume the consistence of a thick and transparent jelly, which is owing to the silica being dissolved; the same process is carried on, but only in a much slower degree by the carbonic acid of the atmosphere, which gradually prepares these mineral constituents of the soil for their reception by the spongioles of plants. The burning of clays not only brings the land into a better state of division, but the process of burning renders the alkaline silicates more easily acted upon by the air, reducing them more rapidly into a soluble condition, and fitting them for supplying to plants the necessary constituents of their growth. It must be borne in mind that all soils ought to be accessible to the action of air—oxygen and carbonic acid—so as to favour the development of the roots of plants. Stiff clays are wanting in these properties, but this may be communicated to them by a partial calcination. With regard to root crops, these may always be adopted where the land is in good heart and fit for their reception, for during the growth of these fallow crops, by frequent hoeing and loosening the soil, pretty nearly the same results may be obtained as by allowing the land to lie idle; besides, the quantity of vegetable matter in the soil is considerably increased by green cropping, thereby leaving it in a far better condition for the production of the subsequent grain crop. It is true that the green crops oppose, to a certain extent, so complete a decomposition of the soil as when a naked fallow is used; but this deficiency may easily be supplied by artificial means, and the advantages of the increased supply of vegetable food in the shape of manure, of the stems and leaves of the plants and the fibres of their roots, will more than compensate for the proportionate decrease of inorganic matter which would have been brought into action by the naked fallow, which result may readily be obtained by a slight dressing of lime. Thus you will perceive that there are various means which may be adopted, either singly or collectively, as the case may be, for doing away with the practice of fallowing in the generality of instances, which will tend not only to a more successful cultivation of the soil, but at the same time will add considerably to the profits of the farmer."

Miscellaneous.

Depth of Covering of Seed Wheat.—In 1845, thinking that I might discover a cause for the different tillering of Wheat by examining the roots, I took up part of a drill, some 50 plants or more; I found invariably that the larger the tube between the seminal roots and the corronal ones, always about an inch below the surface, the fewer were the tillered stems; this led to some experiments, and on the 7th July, in the same year, I sowed at seven depths three grains; the first three with the least possible covering, the second with an inch of covering, and increasing the covering by an inch in each of the successive ones. Of Nos. 1 and 2, all came up; of those covered with 2, 3, and 5 inches, two came up; and of those with 4 and 6 inches of covering, none came up. Those most lightly covered came up first by from one to three or four days, appeared stronger, and tillered more freely. And again, on the 8th September, I sowed five rows of 12 grains each—

No. 1.	Lightly covered,	11	came up,	producing	77 stems.
2.	With 1 inch covering,	11	came up,	"	57 "
3.	With 2 inches "	8	"	"	38 "
4.	With 3 inches "	6	"	"	38 "
5.	With 4 inches "	6	"	"	34 "

Since then my usual covering has been light, and I have not remarked the Wheat to suffer from the frost, or sustain any injury from being thus lightly covered. In rowed Wheat, of small experiments, I have, however, hoed up a little earth to the plants so soon as they were strong above ground; and, indeed, the stirring of the surface earth about the plants at this period of their growth seems to me of very material consequence; I have some reason to believe that Barley and Oats bear a heavy covering better than Wheat. Although these experiments appear favourable to light covering, yet I have had Wheat sown under the ploughs, the seed delivered by barrows following them, with covering of three or four inches, which has tillered well. If a heavy covering is found to diminish the tillering property of grain plants, we may avail ourselves of it, where it is considered advisable in late sowings, to check that disposition in

addition to thick seeding. Except in very late sown winter Wheat, I think it problematical that a difference of an inch or two of depth in sowing will have much effect in preventing the plants being thrown up by the frost: for the seminal roots strike downwards directly from the seed with such inconceivable rapidity to so great a depth, that this difference is lost in the comparison; and, indeed, the corronal roots, though they shoot out at first horizontally, almost immediately take a downward direction, and also grow rapidly. I am disposed to think that the ejecting process may be more effectively prevented by draining the land; the roots of the plants will then take a deeper and firmer hold of the soil, and the action of frost will be diminished by a lessened abstraction of its heat. *J. M. Goodiff, Dublin Farmers' Gazette.*

Calendar of Operations.

JUNE.

FARM NEAR CHELMSFORD, *June* 25.—Since our last communication we have had a continuance of dry weather, with northerly and north-easterly winds, and with white frost more or less at night; and although the grain crops are looking vigorous and healthy we do not recollect their progressing so slowly upon any former occasion. A few Wheat ears were observed on the 12th, and upon the 25th (the day upon which we are writing) some are to be seen in a majority of the pieces in this district. The Wheat is in appearance as healthy as it can possibly be desired, not the slightest attack of rust has appeared to check its growth; the colour may be of somewhat too dark a green colour, but sunshine and a continuance of dry weather will bring it right; and speaking of it upon this farm particularly, we are perfectly satisfied both with the plant and appearance, and are enabled to say unhesitatingly that it never can have appeared more promising. As regards the district generally this observation will apply, with the exception that there is a deficiency of plant to a considerable extent, though from the vigorous growth that has taken place, the result will depend upon the future state of the weather betwixt the present period and the coming harvest. Our Barley has of late progressed more rapidly than the Wheat, and is unusually promising. The same observation applies to Oats, except upon those which were sown late, which from the drought that then existed are irregular in plant, but are otherwise progressing rapidly. Beans we have none, but in general they are very promising, and at present bid fair to be a full crop; whilst Peas are thin in plant and far below the standard, and we believe this observation will apply throughout this county. The prospect of the Clover and Grasses for hay crops is universally bad; not more than a moiety of the usual breadth has been reserved for mowing, and, unless upon the very best land, only a moderate crop can be expected; whilst upon the inferior soils sufficient will not be found to be worth the trouble of cutting: for from the succession of cold weather that has followed since the rain, the Grass has been arrested in growth, and will be the lightest crop mown for many years past. We shall commence cutting Clover from this day, and shall then proceed with the Grass in regular succession. The weather appears clearing up, and, with the barometer rising, we hope for a successful result. The Mangold Wurzel grows more slowly than usual; this we attribute entirely to the absence of sunshine, and low temperature in addition, that has prevailed; most of it is now singled out, and although the ravages of wireworm are complained of throughout the district, we have escaped, and have generally a full plant, but decidedly later by two or three weeks than usual. Throughout the district there is a general complaint of the destruction of the young Swede Turnips by the fly, and most of our neighbours have been compelled to resow the land; many, however, wait to sow the common Turnip instead, as Swedish Turnip seed has become uncommonly scarce. As regards our own prospects we have a full and vigorous plant upon all those pieces succeeding Rye and other early spring crops; but upon a smaller portion fallowed from the commencement the whole of the plants are eaten up, and the land during the past week has been replanted with Drumhead Cabbages, with the further planting of which we are still proceeding. We form ridges about 3 feet in width, and more heavily, and plant upon the top of the ridge after ploughing the soil over the manure, and then roll down with a two-horse roller; the plants are placed 3 feet apart, and the soil made firm about them by pressure of the dibble and watered plentifully once or twice as the weather may happen to prevail. So little regard is paid by some persons to the carrying out this process that we have seen half the plants lost by improper management; for whatever the state of the weather may be, we hold it is always necessary to water them at the time of planting. Our Potatoes, as we before stated, are deficient in plant, owing to an application of lime and salt, which with the combined action of dryness of the salt destroyed the plants altogether. We are now informed that our ill success has arisen from not incorporating the mixture well with the soil before planting. This happens about the same with any new experiment; even under full directions, by the omission of the use of the bag, the plum pudding was spoiled. A correspondent of your Paper inquires if Mangold Wurzel is injurious to small pigs and breeding sows. We can state by our own experience that we have invariably found it so, and have always endeavoured to keep them from it by sending them away during the winter and spring months to a farm where it is not used. The farrows of pigs are small in number and puny in size, and they gradually waste away as if under the effects of fever until put upon different food. The sows, on the contrary, grow fat, as is the case with large hogs, which thrive remarkably well, especially with a little corn in addition. If a large number of hogs are fed upon it with a few Beans in an open yard, we know of no better method of making a large quantity of excellent manure at the cheapest cost. Upon one field sown down with advertised Grasses from a first-rate advertising house, we have a full crop, but 90 per cent. is common Rye-grass; for this seed we paid 32*s.* per acre, and might have obtained as good a result from Rye-grass alone at 12*s.* 6*d.* per acre. In appearance it resembled a proper mixture, and, had the artificial Grasses been new seed, might have turned out well. So, to prevent such excellent attempts in future, we mean to purchase each description of seed separately and mix them ourselves; and we can recommend others to follow the same practice. In the matter of seeds, we rarely obtain them genuine or good. Some Kohl Rabi and Broccoli, Turnip, and Kohl Rabi. Our Carrots never came up except in very small quantity, and Parsnips to the same extent; as such plants are difficult to obtain, we are not able to charge the deficiency entirely to the seed. But we know that it is the practice with seedsmen to mix their old seeds with a small percentage of new, so that upon sowing them a plant cannot be obtained, unless by using a much larger quantity. What we recommend is for farmers to grow their own seeds, or to purchase of those neighbours upon whom they can depend. As regards Grasses, every one can have them gathered in his own locality by hand or women and children at a small cost proportionately with seedsmen's prices; and as this is the season, we name it that an opportunity should not be lost.

WESTON REES, *June* 18.—With the exception of the last two days the weather we have had for three weeks has been as favorable as agriculturists could desire, and the crops have been progressing at an astonishing rate. Wheat has shot up with great rapidity, and in early fields is in the *shot*-blade. In well drained and well prepared fields Wheat is to be a full crop, but where the land is wet and cold, it looks thin and stinted, and cannot in many places be more than half a crop. Having had occasion lately to pass over a large part of the country, I am satisfied that the Wheat crop must be greatly inferior to that of last year. In such a year as this the advantages of thorough draining are very manifest. Whatever the crop be, when sown in damp and cold soil it is long of coming away, and unfortunately there is always abundance of weeds, to the growth of which cold and damp prove no great hindrance, which rushes up, proves a sad nuisance to the growing crop, and keeps ahead of it all the way on to harvest. Oats and Barley generally look well. Potatoes are brairding strong and regular. Last year when they came up they appeared anything but vigorous, and were quite unfit for passing through the trial that awaited them. This year being more robust, we anticipate that they will come through well nigh unscathed. The earlier sown Swedes, although now three weeks in the ground, have made little progress. At first only part brairded, and now the second half is coming away. Betwixt the two we will have abundance of plants. Sowing of common Turnips is now proceeded with, and will be well nigh finished this week. Manures of all kinds are abundant in the north this year, and although high priced, a large quantity is applied. Hay is very light generally; pastures have been growing rapidly, and the stock are just now abundantly supplied. Cattle markets continue stiff, although prices are still high. The demand for fat in the south continuing good, nearly all our heavy cattle find their way thither, and fleshers at home are sadly complaining of the scarcity of this commodity. Good draught horses for sale are very scarce, and have not been so dear for many years. Wages of half year servants have been rising. They now receive from 7*l.* to 10*l.*; boys from 2*l.* to 4*l.*; and women from 2*l.* to 3*l.* Labourers are fully employed at about 14*s.* per week.

Notices to Correspondents.

COARSE GRASS IN OLD PASTURE: *Woodley.* Cast wood ashes broadcast over the spots or pieces of coarse Grass after mowing them down, and you will find that the next growth will be readily eaten.

CHARCOAL DUST: *Ignoramus.* It is one of the very best things you can use to absorb the liquid manure, and thus apply to to the land. We have just emptied a tank, 8 feet in diameter and 9 feet deep, upon a heap of imperfectly burnt ashes standing upon about 30 square yards, and the ashes have taken all the water up—none has run from it; we attribute this absorbent power to the charcoal it contains. Three or four cartloads of charcoal dust per acre, thus saturated, would be a powerful dressing.

GARDEN PLOUGH. We should be glad to know the maker of "Warren's Pony or Garden Plough."

HAYMAKING MACHINE: *Subscriber.* It will answer any where if the ground is so far even as that the line joining its two wheel tracks shall always be (not level but) straight.

OSIERS: *G E.* The following is the character given of the varieties named in the article you refer to:—Salix viminalis (common Osier).—Very coarse and brittle; cast out of beds everywhere. Brindled Osier, Blotched Osier, Snake Osier, Speckled Osier. —Different names for the same variety; it is the very best variety of Salix viminalis grown. Yellow-barked Osier.—The next best variety. Velvet-topped Osier.—A good sort. Apple-tree Osier.—Ditto. Salix Forbyana.—The last new kind; a very excellent Osier for general purposes, and of a good colour when stripped. The new kind good, but inferior by much to some. Salix triandra (black-budded Spaniard).—The very best Osier for bottoming farmers' sieves, and for the narrow strips for finishing the handles and borders of baskets. Grey Spaniard.—Tolerably good for brown use. Horse Spaniard.—Coarse, very inferior. Brown Spaniard.—Rather better than Horse Spaniard. Salix rubra (green-leaved Osier, or Ornard). —Very excellent and very tough; with the bark on, the best for carboy baskets. Salix Hoffmanniana (Brown rod Osier, Brownard Osier, Silver Osier).—Silvery on under side of leaf; all sound shortish rods, good for eel-wheels. Salix amygdalina.—There is a variety of this, grown near Chertsey, of long growth and tolerable quality; local name not known. Gelster (g hard), Horse-Gelster.—Both shortish pretty solid rods for brown work, and for eel-wheels. Salix Lambertiana (blunt-leaved Ornard), S. Helix (rose Ornard), S. lanceolata (bastard French.—All rubbish, but used for hampers and fish packing-baskets. It is one or other of these which, by snapping in working, causes our trousers to be torn by hampers. Salix purpurea (or bitter Ornard).—I have not seen this grown as an Osier, but it ought to be; it is very tough, very slender, and will grow in wetter ground than any, except the Ornards, all which grow in water. In addition to those named there are two excellent Osiers, the botanic name of which I am uncertain of. Real French.—A most excellent Osier, especially for fine work; used very much for cooper's twigs; that is the twigs used to bind wood hoops on wine casks, &c. Stone Osier.—Also a very excellent Osier; much grown along the Kennet; used for fine work, twigs, &c. Salix fragilis, S. Russelliana, S. alba, and the varieties Alba cærulea, and A. repens—are all occasionally grown as Osiers in Osier-grounds, for the purpose of making eel-wheels and for coopers' twigs; but Salix rubra and the real French are very much superior. Of these Russelliana is the best. S. vitellina I have never seen grow as an Osier, it is used in gardens for its toghness; if it could be grown as an Osier free from side twigs, it would be, with the bark on, the very best for carboy packing. Now, if I had 4 acres to plant with Osiers, I would plant—

One with brindled Osier ...	... 3 ft.	0 in.	by	2 ft.	0 in.
One with last new kind ...	... 3	0	„	2	0
Half with black-budded Spaniard	3	0	„	2	0
Half with yellow-barked Osier	2	6	„	1	8
Half with green-leaved Osier ...	2	6	„	1	8
Half with real French ...	... 2	0	„	1	4

And I would try a rod or two of bitter Purple, remembering that the green-leaved Osier and bitter Ornard should be in the wettest ground. Nevertheless, it is a great error to suppose Osiers grow best in swampy ground. They grow best in a loose sandy loam, but do not mind being occasionally overflowed. *J. C. X., Bermondsey.*

POULTRY: *F Z.* Cochins are the birds that will best answer your purpose, as they are good layers, and easily kept within bounds.

PRIZE LIST AT TIVERTON. At page 412, Mr. F. Webber, of Tiverton, is stated to be the winner for the second best heifer and 3 best cows in calf. In correction of this we have to state that Mr. Thomas Webber, of Halberton Court, Tiverton, Devonshire, received the following prizes:—For the best heifer above 2 and not exceeding 3 years old, bred by himself, second prize; for best pair of heifers, not exceeding 12 months old on the 1st September, 1854, bred by himself, first prize; for the best 3 cows, owner's own breed, in calf or in milk. first prize.

SWEDISH TURNIPS: *Constant Reader.* Mr. Carleton Smythies merely described the effect of burnt clay lumps gathered off the field and full of Couch, with those of farm-yard dung and of turf ashes. The ashes were best, then the dung, and lastly the burned clay. His conclusion is, that the vegetable matter present in the turf and dung is essential as a Turnip manure.

THE FENS: *X.* Some week or two ago we are told that the sharp frost and dry weather had on some of the light lands destroyed 9-10ths of the plant, and if any crop were known which would be likely to be of more value than three sacks of Wheat per acre there would have been inducement on one farm alone to plough 30 acres up. The strong lands in the neighbourhood look uncommonly well, but it must be a late harvest.

RICHMOND & CHANDLER'S PATENT CHAFF CUTTING MACHINE.

All the various modern Implements of Agriculture manufactured on the most scientific and improved principles, suitable for home use and exportation.—Address, RICHMOND & CHANDLER, Salford, Manchester; and 32, South John Street, Liverpool.
☞ CATALOGUES GRATIS.

PARKES' STEEL DIGGING FORKS & DRAINING TOOLS.
MESSRS. BURGESS AND KEY, as Mr. PARKES' Wholesale Agents for England, have always in stock a large assortment. These Forks and Tools are now in use by upwards of 1000 of the Nobility and Farmers, members of the Royal Agricultural Society, who pronounce them to be the best ever invented, and to facilitate labour at least 20 per cent. Price Lists sent free on application, and Illustrated Catalogue of the best Farm Implements, on receipt of eight postage stamps.

IMPORTANT TO AGRICULTURISTS.

PATENT
LIQUID-MANURE DISTRIBUTOR OR WATER-CART.
ISAAC JAMES, Tivoli, Cheltenham, begs most respectfully to solicit the attention of Agriculturists and others, to his newly-invented Patent Liquid-Manure Distributor, or Water-Cart. The advance of science having so exhibited to Agriculturists the superior advantage of using Liquid-Manure as to induce its almost general adoption, a great want was felt for a Distributor, so constructed as to answer the purpose of equally distributing any quantity, without being liable to clog up, and thus hinder the progress of the work, and waste the time of the workman, and yet produced at a price alike available to the small farmer or gardener, as to the more wealthy and extensive cultivator.

I. JAMES warrants his Distributor to supply the desideratum so long felt. Its superiority consists in possessing the following advantages:—

1. It has two Strainers, so arranged as to prevent anything but liquid entering into the Distributor, so that it is impossible for it to clog up. 2. The liquid is forced through the Distributor so as to scatter any quantity on the land, in a copious shower from 10 to 15 feet wide (according to size), which saves a great amount of time and labour. 3. It has waterproof joints, so that the liquid may be carted to any distance without wasting it. 4. It will work equally well on hilly as on level land, without any alteration. 5. It can be advantageously adapted for the Distribution of Guano, &c., on either Drilled Crops or Pasture Land. 6. It is so constructed as to be thoroughly adapted for Watering Streets. 7. It works so simply that even a boy can superintend it.

PRICES:—

250 gallons, suitable for working by horse, £22 weight of cart, 8½ cwt., tire 4 inches.					
150	do.	do.,	£18 weight of cart,	6½ cwt.,	tire 3 inches.
70	do.	by pony,	11 „	3½ cwt.,	tire 2½ „
40	do.	by man,	9 „	2½ cwt.,	tire 2 „

Terms—Net Cash. A remittance or banker's reference must accompany each order.—Tivoli, Cheltenham.

COWS.
HARVEY'S CELEBRATED COW DRINKS, 1*s.* each, have been used with great success. Plain directions are given with each Drink for the treatment of most diseases incidental to Cows, for which they will be found a safe and effectual remedy. One Drink given at the commencement of the Tick, or Feet and Mouth Distemper, will perfectly eradicate it in a few days.—Compounded by R. HARVEY, Veterinary Surgeon, Macclesfield, Cheshire. Sold by all Medicine Vendors. Wholesale Agents, BARCLAY & SONS, and MARSDEN & SONS, London.

This day is Published, PART IV., price 6s., in splendid folio, of the

NEW AND REVISED EDITION OF MR. KEITH JOHNSTON'S GENERAL GAZETTEER.

In one large Volume, 8vo, of 1360 pages, comprising about 50,000 Names of Places, price 36*s.* cloth, or half-russia, 41*s.*,

A NEW DICTIONARY OF GEOGRAPHY, Descriptive, Physical, Statistical, and Historical: forming a complete General Gazetteer of the World. By A. KEITH JOHNSTON, F.R.S.E. F.R.G.S., &c., Geographer at Edinburgh in Ordinary to her Majesty. Second Edition, brought down to May 1855.

*** In the present New Edition omissions have been carefully supplied, and the number of abbreviations has been greatly reduced. So large a portion of the volume has been re-written and the remainder has been so thoroughly revised and corrected that it may fairly claim to be considered a new work, the most recent and it is believed the most comprehensive of its class.

London: LONGMAN, BROWN, GREEN, & LONGMANS.

TO BOOK CLUBS, READING SOCIETIES, AND READERS IN GENERAL.

Now ready, No I. of

NOTES ON BOOKS: Being an Analysis of the Works published during each Quarter by Messrs. LONGMAN & Co.

The object of this publication is to enable Book-buyers readily to obtain such general information regarding New Books and New Editions published by Messrs. LONGMAN & Co. as they would derive from the perusal of well-arranged tables of contents or explanatory prefaces. With this object each notice is confined to an Analysis of the Contents of the work referred to. Critical opinions and laudatory notices are excluded.

Copies are sent free by post under the new Treasury Minute to all Secretaries, Members of Book Clubs and Reading Societies, Heads of Colleges and Schools, and private Persons, who forward their addresses to Messrs. LONGMAN & Co. for this purpose.

*** The second number will appear on August 31.

London: LONGMAN, BROWN, GREEN, and LONGMANS.

NEW AND ENLARGED EDITION OF DR. LINDLEY'S THEORY OF HORTICULTURE.

Just Published, in 8vo, with 98 Woodcuts, price 21*s.* cloth.

THE THEORY AND PRACTICE OF HORTICULTURE; or, an Attempt to explain the chief Operations of Gardening upon Physiological Grounds: being the Second Edition of the "Theory of Horticulture," much enlarged. By JOHN LINDLEY, Ph.D., F.R.S., Corresponding Member of the Institute, Vice-Secretary of the Horticultural Society, Professor of Botany in University College, London, &c.

"The First Edition of this valuable work was issued in 1840, since which time it has had an extensive circulation and has been translated into the German, Dutch, and even Russian languages. Being more particularly restricted to principles however, the author at length resolved to render the work more generally interesting and useful by a more frequent reference to practical operations. He has thus greatly extended the matter by supporting the physiological doctrines with an appeal to facts familiar to cultivators, or which ought to be: and the result is a still more interesting and popular compendium of the principles and practice, or the science and art, of horticulture."—*Gardener.*

"This is a Second Edition of the "Theory of Horticulture," with the addition of a large quantity of practical matter, introduced to show how entirely scientific principles and good cultivation correspond. The volume contains about four times as much matter as the first edition . . . . Although very large additions are made to every chapter, while many passages in the first edition have been wholly struck out, it may be proper to say that the greatest changes are those which relate to vitality, constitution, domestication, ventilation, propagation, pruning, resting, the soils and manures; such being the subjects in which practical men are most interested. The whole work has, indeed, assumed such a form as to make it evident that the great object of the author has been, not to produce a work suited to men of science, but one which every well informed gardener may understand and apply. As the volume concludes with a very copious index of matter, there is no difficulty in ascertaining where any given subject is treated of."—*Gardeners' Chronicle.*

By the same Author.

INTRODUCTION TO BOTANY. 4th Edition, greatly enlarged; with 6 Plates, and numerous Wood Engravings. Two vols. 8vo. 24*s.*

*** It has been the Author's wish to bring every subject on which he has introduced down, as nearly as possible, to the state in which it is found at the present day. In doing so, he has added so very considerable a quantity of new matter, especially in what relates to Vegetable Anatomy and Physiology, that the present Edition may be considered, in those respects, a new work.

London: LONGMAN, BROWN, GREEN, & LONGMANS.

CAUTION.

PARKES' STEEL DIGGING FORKS AND DRAINING TOOLS.

Whereas very inferior descriptions of Steel Digging Forks are now manufactured and sold, and I have been informed that purchasers of the same have believed them to be the same as those manufactured by me, and to which the Royal Agricultural Society and numerous Agricultural Societies' prizes have been awarded, I hereby respectfully inform the public that every Fork manufactured by me is stamped with my trade mark "J. P.," and that Messrs. Burgess & Key, of No. 103, Newgate Street, London, are my sole Wholesale Agents, and I have authorised them to replace to the purchaser every Fork of my manufacture found defective; they will also on application send Wholesale and Retail Price Lists, &c., post free. FRANCIS PARKES & Co.

BUDDING'S GRASS-CUTTING MACHINE, nearly new and in first-rate condition, to be Sold a bargain. Cuts, Rolls, and Sweeps the Grass whether wet or dry at one operation. Admirably adapted for lawns, pleasure grounds, &c. On view at W. S. MULLINGEN'S, General and Furnishing Ironmonger, Enfield, Middlesex.

W. S. M. has also on sale a large and well assorted stock of Garden Tools of every description. Galvanised Wire Netting, 1-inch mesh, 2 feet high, 6d. per yard run. Iron Hurdles and Continuous Fencing made to order. Greenhouses or Conservatories heated with hot water apparatus on the best principle by experienced workmen. Estimates given.

SAMUELSON'S REGISTERED LAWN MOWING MACHINES. To cut 16, 19, 22, and 25 inches wide. The Registered Improvement renders unnecessary the great care requisite in the handling of these Machines on the old plan. All that is now required can be done *by any unskilled labourer*, who has only to push the Machine before him, the Registered Adjustment insuring a clean cut of uniform height, and preventing the knives from cutting into the soil, however uneven the ground may be. Illustrated Price Lists, with copies of Testimonials, and a Catalogue of his other Agricultural Implements, may be procured, post-paid, on application to the Manufacturer,

B. SAMUELSON, Britannia Works, Banbury, Oxon.

The above may also be procured at the principal Agricultural Implement Depôts in London, and of all respectable Ironmongers and Seedsmen in the country.

HOW TO KILL RATS AND MICE BY HUNDREDS.—A Receipt may be had, honestly worth 20l., without trouble, by sending 30 postage stamps and a directed envelope to Mr. WILLIAM FRANKLIN, Post-office Street, Norwich, who will forward it with plain instructions, &c. This is a most extraordinary remedy, such as no Farmer, Merchant, or Miller ought to be without, as it will save them pounds yearly by killing every Rat or Mouse either in the field, stack, or house.

WATERPROOF PATHS.
BARN AND CATTLE SHED FLOORS.

THOSE who would enjoy their Gardens during the winter months should construct their walks of PORTLAND CEMENT CONCRETE, which are formed thus:—Screen the gravel of which the path is at present made from the loam which is mixed with it, and to every part of clean gravel add one of sharp river sand. To five parts of such equal mixture add one of Portland Cement, and incorporate the whole well in the dry state before applying the water. It may then be laid on 2 inches thick. Any labourer can mix and spread it. No tool is required beyond the spade, and in 48 hours it becomes as hard as a rock. Vegetation cannot grow through or upon it, and it resists the action of the severest frost. It is necessary, as water does not soak through it, to give a fall from the middle of the path towards the sides.

The same preparation makes first-rate paving for BARNS, CATTLE-SHEDS, FARM-YARDS, and all other situations where a clean, hard bottom is a desideratum. May be laid in winter equally well as in summer.

Manufacturers of the Cement, J. B. WHITE & BROTHERS, Millbank Street, Westminster.

A HANDSOME PORTABLE BAROMETER FOR 21s.

HENRY BAKER calls the attention of the public to his Improved MODEL BAROMETER, made of solid Rosewood and mounted with Ivory Plates, with a Thermometer. The above Instrument for Accuracy and Style stands unrivalled; it is Portable, and WARRANTED to perform well; and being manufactured on the premises, it is highly recommended. Can be sent into the country without risk of breakage for 1s. extra.

HENRY BAKER, Instrument Maker to the Board of Admiralty, 30, Hatton Garden, London.

At FYFE & Co.'s Sanatorium, 46, Leicester Square, London.

MIRACULOUS MEDICINE.

DR. ARNOT'S DIGESTIVE APERIENT PILLS strike at once at the root of disease, throw off the morbific agent, create a new and sanatory condition of the Blood and Secretions, strengthen the Constitution, and speedily restore the patient to Health. A trial will prove the extraordinary curative properties of this medicine.—In boxes at 1s. 1½d. Order of all Chemists. Depôt, 50, Rathbone Place, London.

THE COMING PILL.—"THE RIGHT PILL FOR EVERY COMPLAINT!"—PAGE WOODCOCK'S WIND PILLS for Wind in the Stomach, Indigestion, Biliousness, Liver Complaints, and all diseases arising from a disordered state of the Stomach and Bowels, will beat the World for efficacy! Try them, and you will say you have got the right Pill this time.—Sold by all respectable Medicine Vendors everywhere, at 1s. 1½d., 2s. 9d., and 4s. 6d. If difficulty occur in remote places, send stamps to PAGE D. WOODCOCK, Lincoln, and you will have them by return of Post.

A CLEAR COMPLEXION,

GODFREY'S EXTRACT OF ELDER FLOWERS is strongly recommended for softening, beautifying, and preserving the skin, and giving it a blooming and charming appearance, being at once a fragrant Perfume and delightful Cosmetic. It completely removes tan, sun-burn, redness, &c., and by its balsamic and healing qualities renders the skin soft, and free from dryness, scurf, &c.; clears it from every humour, pimple, or eruption; and by continuing its use only a short time the skin becomes and continues soft and smooth, and the complexion clear and beautiful. In the process of shaving it is invaluable, as it annihilates every pimple and all roughness, and affords great comfort if applied to the face during cold easterly winds.—Sold in Bottles, price 2s. 9d., with directions for using it, by all Medicine Vendors and Perfumers.

HOLLOWAY'S PILLS AN EFFECTUAL SPECIFIC FOR NERVOUSNESS, DEBILITY, AND LOWNESS OF SPIRITS.—The extraordinary regenerating effects produced by these invaluable Pills are truly astonishing; they act in such a peculiar manner on the system, if taken according to the directions given, that nervous irritability is quickly allayed, the tone of the stomach strengthened, the digestion improved, a freedom of circulation promoted in the blood, and consequently the most robust health is thereby attained. Persons of studious or sedentary habits being liable to these complaint should take HOLLOWAY'S Pills, which are considered the greatest blessing ever discovered for the good of mankind.—Sold by all Medicine Vendors and at Professor HOLLOWAY'S Establishments, 244, Strand, London, and 80, Maiden Lane, New York.

DR. DE JONGH'S

LIGHT BROWN COD LIVER OIL. Prescribed with entire confidence by the Faculty for its purity, and superior, immediate, and regular efficacy.

EXTRACTS FROM MEDICAL TESTIMONIALS:—

ARTHUR H. HASSALL, M.D., F.L.S., M.R.C.P., Chief Analyst of the Sanitary Commission of the *Lancet*, Author of "Food and its Adulterations," &c. &c.

"I have more than once, at different times, subjected your Light Brown Oil to chemical analysis—and this unknown to yourself—and I have always found it to be free from all impurity and rich in the constituents of bile. So great is my confidence in the article, that I usually prescribe it in preference to any other, in order to make sure of obtaining the remedy in its purest and best condition."

The MEDICAL CIRCULAR, May 10, 1854 —

"We unhesitatingly recommended Dr. de Jongh's Light Brown Cod Liver Oil as the best for medical purposes, and well deserving the confidence of the profession."

Sold only in bottles, capsuled and labelled with Dr. DE JONGH'S Signature, WITHOUT WHICH NONE ARE GENUINE, by ANSAR, HARFORD, & CO., 77, STRAND, London, Dr. DE JONGH'S sole Consignees; and IN THE COUNTRY, by respectable Chemists.

Half-pints (10 oz.), 2s. 6d.; Pints (20 oz.), 4s. 9d.; Quarts (40 oz.), 9s.; IMPERIAL MEASURE.

TO LANDSCAPE GARDENERS, AND OTHERS.

SUDBURY BURIAL BOARD.—The Burial Board for the Borough of Sudbury hereby give notice that they are prepared to receive Designs and Estimates for laying out, Embellishing, and Planting their proposed Burial-ground containing about 7 acres. The Board will not pledge themselves to employ the party whose design shall be approved; and in the event of his not being so employed, he shall be paid the premium of five guineas for his design, which shall become the property of the Board. A plan of the ground may be seen, and further information obtained at my office. The Designs and Estimates are to be sent free of expense, under seal, without the author's name, but with a motto, on or before the 16th day of July next, addressed to me, marked "Sudbury Burial Ground," a sealed letter, containing real name and address, should accompany each design and estimate, which will be opened after selection made, and those not approved will be returned. No Design, &c., with the author's name upon it, will be received.

ROBT. RANSOM, Jun., Clerk to the Board.

DEVONSHIRE CYDER.—A three dozen case (large bottles), of the very best DEVONSHIRE CHAMPAGNE CYDER, will be forwarded to any address on receipt of a Post-office order for 21s., payable to JOHN E. REEDLE, Martin Street, Octagon, Plymouth. Case and bottles, value 9s., included.

KENTISH TOWN.

TO BE LET, within 15 minutes' walk of the New Cattle Market, a superior FURNISHED BED-ROOM and SITTING-ROOM suitable for a Country Gentleman, who might be desirous of keeping private apartments, within half an hour's ride of the City and West End part of London. Rent 15s. per week, or with an extra Bed-room for two gentlemen friends) 22s., no extras, including attendance, cooking, &c.—For further particulars, apply at Albion Cottage, 13, Clarence Road, Kentish Town.

TO BE LET, at Haxby, near York, within a short distance of the Railway Station, a neat and compact COTTAGE, with requisite Outbuildings, and Nine Acres of Land, well adapted for a Nurseryman, Seed Grower, or Market Gardener, and may be entered on at Michaelmas next.—For particulars, apply to Messrs. BAINBRIDGE & HEWISON, Nurserymen and Seedsmen, or Messrs. ACTON & SON, Auctioneers, Low Ousegate, York.

GREENGROCERY AND COAL TRADE, WITH A JOBBING GARDENING CONNECTION.

TO BE SOLD, with Coal-shed and 20 tons of best Double-screened Wallsend Coals, with Shop fixtures, &c., situated in a highly respectable and improving neighbourhood, 8, Corrie Place, near the "Lord Nelson," Old Kent Road. This is an excellent opportunity for any one with a small capital desirous of entering into business; the present proprietor, having been four years in the same premises, has now an unexpected and advantageous offer, which requires him to leave immediately. Rent very moderate.—For particulars, apply on the premises.

TO NURSERYMEN.

TO BE SOLD, by Private Contract, either altogether or in Lots to suit Purchasers, the long established and flourishing NURSERY PREMISES of the late Mr. George Clarkson, Fulford Road, York, stocked with Forest and Fruit Trees, Shrubs, &c.; and having a substantial Dwelling-House, Shops, and Greenhouse, and other requisite Outbuildings attached—Plans and Particulars may be had on application to Mr. LUKE THOMPSON, Solicitor, Judge's Court, York.

NURSERY AND SEED BUSINESS.

TO BE SOLD, or LET for a term of years, a Nursery, Seed and Plant Business, which has been successfully carried on for the last 35 years in a rapidly rising and most fashionable watering-place in the south of England. The Nursery grounds are advantageously situated in the midst of the town, within half a mile of the Railway Station, and close to its principal entrance is the large Seed and Show Shop. The Grounds comprise about eight acres of good land, and four large Glass Structures, heated with hot water, with several pits and Frames, the whole being well furnished with a Young and Saleable Stock. Any person wishing to carry on the above business will find this well worthy of attention. Satisfactory reasons will be given for the retirement of the present proprietor.—For further information apply to Messrs. E. G. HENDERSON & SON, Wellington Road, St. John's Wood, London.

Cypripedium eburneum	Vanda tricolor
" barbatum grandiflora	Burlingtonia fragrans

May be viewed on the morning of sale and Catalogues had.

MESSRS. FRASER'S SPECIMEN PLANTS.

MR. J. C. STEVENS is instructed by Messrs. Fraser, Lea Bridge Road, to Sell by Auction, at his Great Room, 38, King Street, Covent Garden, on TUESDAY, 10th July, at 12 for 1 o'clock, their collection of SPECIMEN STOVE and GREENHOUSE PLANTS, Heath and Azaleas, many of them in fine bloom. Catalogues are preparing, and will be ready for distribution one week prior to the sale.

TO GENTLEMEN, NURSERYMEN, AND OTHERS.

MR. J. WILLMER is instructed by Charles J. Selwyn, Esq., to sell by Auction, on the premises, Larkfield Lodge, Richmond, on TUESDAY, July 3d, 1855, at Twelve o'clock, upwards of 6000 GREENHOUSE and HERBACEOUS PLANTS in pots, Pits, Lights, Greenhouses, &c. &c.—May be viewed the day preceding the Sale, and Catalogues had on the premises, and of the Auctioneer, Sunbury, Middlesex.

WESTON-SUPER-MARE.

To NURSERYMEN, GARDENERS, AND OTHERS.

MR. SAMUEL NORTON will sell by Auction, at the London Inn, Weston-super-Mare, on TUESDAY, the 10th day of July next, between the hours of 5 and 7 o'clock, all that convenient Messuage or Dwelling-house, with the Outbuildings, Hothouses, Forcing Pits, Nursery and Gardens, for many years in the occupation of Mr. Thomas Taylor, containing together 2a. 3r. 17p., for the remainder of a Term of 21 years, granted by Lease dated 29th September, 1848, and subject to a reserved Rent of 25l. per Annum. The above premises are situate near the Locking Road, having a roadway of 16 feet wide from the same into the Nursery Grounds. To view the same apply to the Auctioneer, and for all further particulars to Mr. HENRY DAVIES, Solicitor, Weston-super-Mare.

HORTICULTURAL BUILDING AND HEATING BY HOT WATER.

AT THE LOWEST PRICES

CONSISTENT WITH GOOD

MATERIALS & WORKMANSHIP.

GRAY & ORMSON, DANVERS STREET, CHELSEA, LONDON.

GRAY AND ORMSON, Danvers Street, Chelsea, having had considerable experience in the construction of Horticultural Erections, which, for elegance of design, good materials, and workmanship, combined with economy and practical adaptation, cannot be surpassed by anything of the kind in the country, are in a position to execute orders on the lowest possible terms.

G. & O. have been extensively employed by the Nobility, Gentry, and London Nurserymen; and they can with the greatest confidence give the most satisfactory references to all by whom they have been favoured with orders. Their Hot-water Apparatus is also constructed on the most approved and scientific principles, for all purposes to which the application of Heating by Hot Water can be made available.

COTTAM AND HALLEN, Engineers, Founders, &c.,

HORTICULTURAL SOCIETY OF LONDON.—THE LAST GARDEN MEETING FOR THIS SEASON will be held on WEDNESDAY, July 11, on which occasion the Grounds of the Duke of Devonshire will, by the kind permission of his Grace the President of the Society, be open to visitors.

FRUIT will be the great feature of this Exhibition.

Tickets, price 5*s*. each, may be procured at 21, Regent Street, or at the Garden, on the day of meeting, price 7*s*. 6*d*. each.

ROYAL BOTANIC SOCIETY, REGENT'S PARK.—The days appointed for the Exhibition of Plants, Flowers, and Fruit next season, are WEDNESDAYS, May 28th, June 18th, and July 9th, 1856.

WATFORD HORTICULTURAL AND FLORICULTURAL SOCIETY.—The first grand Show of the above Society will be held by permission of the Earl of Essex, in Cassiobury Park, near Watford, on WEDNESDAY, the 18th day of July; open to all Exhibitors. An efficient band will be in attendance. Schedules are now ready, and can be had on application to the Secretary, Mr. J. TAYLOR.

By order of the Committee, JOHN PEARCE TAYLOR.

GARDENERS' ROYAL BENEVOLENT INSTITUTION.—At a General Meeting of the Members of this Society, held on Wednesday, the 4th July, for the purpose of electing Three Pensioners on its funds, the following was the result of the ballot:—

Name.	Application.	Age.	Votes.
John Appleby	Eleventh ...	62	520
Cornelius Robinson	Ninth	77	471
John Blacke	Fifth	80	193
William Thacker	Fifth	67	49
Charles Charlton	Fourth ...	68	196
Joseph Jeffery	Fourth ...	62	69
John Kent	Fourth ...	72	351
George Kidd	Fourth ...	69	375
John Lawson	Third	76	32
James Smith	Third	69	39
Ann Arnold	Second ...	63	127
Thomas Blair	Second ...	70	519
Frederick Burnet	Second ...	53	158
William Dungate	Second ...	69	41
Alexander Gregory	Second ...	62	229
William Thornton	Second ...	69	9
William Jackson	First	66	15

The Meeting then declared John Appleby, Thomas Blair, and Cornelius Robinson, as having the greatest number of Votes, duly elected Pensioners of this Charity.

July, 1855. EDWD. R. CUTLER, Secretary.
14, Tavistock Row, Covent Garden.

LOST, at the Royal Botanic Society's Exhibition, in June last, a plant of BORONIA SERRULATA. The subscribers supposing one of the exhibitors has taken the above in error, and not knowing to whom it belongs, have kindly taken care of it, they will feel greatly obliged, should this meet the eye of that person, for any information respecting the same.—Messrs. FAMPLIN & SON, Nurserymen, Lea Bridge Road, Leyton, Essex.

WILLIAM BARRATT, LANDSCAPE GARDENER, Wakefield.
*** Plans and Estimates furnished.

JOHN HARRISON, NURSERYMAN, SEEDSMAN, FLORIST, LANDSCAPE GARDENER, &c.
Plans and Estimates furnished; Experienced Gardeners recommended; also several Young Men in the Nursery waiting for Under Gardeners' Situations.—Darlington, July 7.

GEORGE TAYLOR, JUN.,
CHOICE FRUIT and VEGETABLE SALESMAN,
St. John's Market,
Liverpool.
CONTRACTOR and PURCHASER of CHOICE GARDEN PRODUCE.
SALESMAN on COMMISSION.
Terms, Cash.
Forward as above.

W. PRESTOE, SEEDSMAN AND FLORIST, Basingstoke, having a considerable number of the undermentioned Seedling Plants, respectfully offers them to the public.

	per 100.—*s*.	*d*.
Hollyhocks from seven superior kinds	5	0
Heartsease or Pansies, from 24 best show flowers ...	2	6
Antirrhinums, from 12 largest and most distinct kinds in existence	2	6
Dianthus verbatus or Sweet William, from 50 superior and distinct kinds (Packing included.)	2	6

The above seed was all selected from very superior flowers for the express purpose of raising new varieties, but in consequence of not having sufficient room to bed them out they are offered for sale.—Post-office Orders payable at Basingstoke, Hants.

IMPROVEMENT OF GRASS LANDS.

SUTTON'S RENOVATING GRASS SEEDS should be sown immediately after the hay is carried.

These Seeds consist of PERENNIAL CLOVERS *and* FINE GRASSES *for improving the bottom.* Price 9*d*. per lb., or 80*s*. per CWT. Eight or 12 lbs. per acre will be sufficient, and will produce a great increase in the produce.—SUTTON & SONS, Reading, Berks.

THE BEST SUBSTITUTES FOR SWEDES.

SUTTON'S PURPLE-TOP YELLOW HYBRID, SUTTON'S GREEN-TOP YELLOW HYBRID AND ORANGE JELLY TURNIP.—Prices, &c., will be forwarded, Post-free, on application (stating quantity required), by SUTTON & SONS, Seed Growers, Reading.

THE QUICKEST TURNIP KNOWN.

SUTTON'S EARLY SIX-WEEKS TURNIP.—*Good New Seed 1s. per lb., or 6s. p. gallon, 45s. per bush.* Carriage free except small parcels.

SUTTON & SONS, SEED GROWERS, Reading.

TURNIP SEED OF PURE SELECTED STOCKS.

FOR

BASS AND BROWN'S Advertisement of present prices, see *Gardeners' Chronicle* of April 28th, and May 5th and 12th. Reduced prices for large quantities.

ERRATA.—For "Laing's Purple-top Swedes, 1*s*. per lb.," *read* "1*s*. 9*d*. per lb." the same price of the other three Swedes.

TO THE TRADE.—Prices will be supplied on application.

Seed Establishment, Sudbury, Suffolk.

THE BEST EARLY CABBAGE GROWN.

COTTRELL'S EARLY CHAMPION may be sown any season. Sold in sealed packets, 1*s*. per oz. The usual allowance to the Trade.—To be had only of DAWE, COTTRELL, & BENHAM (Successors to F. Warner), Wholesale Seedsmen, 3, Lawrence Pountney Lane, and 36, Moorgate Street (late 28, Cornhill). Established 1720.

NEW SPRING CABBAGE "EXCELSIOR."

WILLIAM KNIGHT, SEEDSMAN, &c., begs to call attention to this fine variety, which is unsurpassed for its excellent quality, being of a very superior flavour, and a certain crop, as it has never been know to run to seed before heading; it is particularly hardy, standing the test of the last winter without a failure. As a certain crop for spring use it is invaluable, for it may be sown at any time without risk, and it will produce a certain crop. Seed is now ready to send out in packets 1*s*. each, or four packets for 3*s*., post free.

67, High Street, Battle, Sussex.

NEW GERANIUM CATALOGUE.

J. DOBSON AND SON beg to announce that their new CATALOGUE of PELARGONIUMS (or GERANIUMS) will be ready by the end of the present month, and will contain only those varieties worth growing, and at reasonable prices for good strong plants.

A Treatise on the Pelargonium sent for eight stamps.

Woodlands Nursery, Isleworth.

CHOICE CALCEOLARIA SEED.

J. DOBSON AND SON are now prepared to send out SEED of their unequalled collection of CALCEOLARIAS, in packets at 1*s*. 6*d*., 2*s*. 6*d*., 3*s*. 6*d*., and 5*s*. each.

Woodlands Nursery, Isleworth.

TO EXHIBITORS OF PELARGONIUMS.

J. DOBSON AND SON can supply a few Cut-down Plants of the New Pelargonium sent out last autumn, Beck's CONQUEROR, acknowledged to be the most distinct variety sent out for some time. Price on application.

Woodlands Nursery, Isleworth.

NEW PELARGONIUMS.

J. DOBSON AND SON have much pleasure in announcing that they will send out the new varieties of the above raised by E. BECK, Esq., of Worton Cottage, and J. WHITE, Esq., of Wethersfield, which will prove the gems of the season. Catalogues with full description and prices will be ready by the end of the present month.

Woodlands Nursery, Isleworth.

WEST MIDDLESEX WHITE GLOBE TURNIP SEED for Bunching, very first-rate; 15*s*. per peck, 8*s*. half peck, 56*s*. per bushel, for cash; bag 1*s*. extra.—W. G. K. BREAVINGTON, Vicarage Farm, Hounslow, Middlesex.

WHITE LISBON ONION SEED.—Large buyers can be supplied with White Lisbon Onion Seed in quantity.—Apply to Mr. HENRY CLARKE, Seed Merchant, 39, King Street, Covent Garden.

GALCEOLARIA AND CINERARIA.

MESSRS. E. G. HENDERSON AND SON beg to announce that the above FLOWER SEEDS, saved from the choicest varieties, may be had in packets at 2*s*. 6*d*. and 5*s*. each; the finest quality of CALCEOLARIA is only offered at 5*s*.; second quality, 2*s*. 6*d*.

This Season's CATALOGUE will be forwarded on application, and a Beautiful Coloured Plate of nine new Flowers will be sent on receipt of 12 postage stamps.

Wellington Nursery, St. John's Wood, July 7.

CALCEOLARIA SEED.

R. PARKER has now ready for sending out Seed which he can recommend with the greatest confidence, it having been saved from flowers of the finest form and most beautiful markings, in packets at 1*s*. 6*d*. and 2*s*. 6*d*. each. Also choice CINERARIA seed saved from the finest named varieties, at 1*s*. 6*d*. and 2*s*. 6*d*. per packet. A remittance or reference to accompany all orders from unknown correspondents.

Paradise Nursery, Hornsey Road, London.

DUTCH BULBS.

AS the period is approaching for sending out the orders for DUTCH BULBS for the ensuing season, we respectfully suggest to our friends and the trade generally, that they instruct their correspondents in Holland to consign the cases to our care HERE, for immediate transmission to their respective destinations, by which greater expedition will be obtained in their delivery.—BETHAM & BLACKITH, Custom House and General Forwarding Agents, Cox's Quay, Lower Thames Street, London.—July 7.

ROSES.

JAMES MITCHELL begs to announce that his unrivalled collection of ROSES is now in fine bloom.

Piltdown Nurseries, Maresfield, Sussex, July 7.

ROSES.

E. P. FRANCIS' extensive collection of Roses on the Manetti Stock will be in full bloom on and after July 12. Trains direct to Hertford from Shoreditch Station.

Rose Nurseries, Hertford.

ROSES.—The Collection at Sawbridgeworth will be in fine bloom the ensuing and following weeks. The 11 30 Express Train to Harlow Station, about one mile from the Nursery, will be found the most convenient.

Nurseries, Sawbridgeworth.—July 7.

ROSES.

A. PAUL AND SON invite inspection of the Collection of ROSES at the Cheshunt Nurseries, which is just coming into Bloom, and will continue to offer new objects of interest from the present time till the end of October. The best means of reaching the Nurseries is by Eastern Counties Rail to Cheshunt or Waltham Stations.

Cheshunt Nurseries (13 miles N.E. of London), July 7.

ROSES.

H. LANE AND SON, The Nurseries, Great Berkhampstead, have the pleasure to inform their patrons that their extensive Collection will be in full bloom after the 11th inst. Their Coniferæ, Rhododendrons, and a general collection of Trees and Shrubs, also Fruit Trees (especially in pots, which may be seen now in full bearing) are remarkably fine and healthy and well worthy the attention of planters. The Nurseries are within a few minutes' walk of the Railway Station on the London and North Western Railway, and an Omnibus from the station passes the gates.

ROSES.

GEORGE CLARKE begs to invite his patrons and the public generally to an inspection of his superb collection, extending over 10 acres of ground, which are now in full bloom, and will continue so till autumn. Plants can be selected now and orders executed in November.

G. C. would direct special attention to his stock of Dwarf Roses, comprising the newest and most choice kinds budded on the Manetti, which are remarkably fine; also to his fine collections of Azaleas, Ericas, Geraniums, Calceolarias, Variegated Plants, Coniferæ, Evergreens, Fruit Trees, &c., which are of the best and most select description. The Nursery is situate on the nearest and most pleasant route from the West-end to the Crystal Palace.—Streatham Place Nursery, Brixton Hill, near London, July 7.

CHOICE CINERARIA SEED.

LUCOMBE, PINCE, AND CO. have now ready for sending out Seeds of their very superior CINERARIAS, which have been saved with great care from the finest varieties. The great satisfaction which their Cinerarias have given for several successive years, enables them to recommend their Seed of the present season with much confidence. Packets sealed and warranted by them at 2*s*. 6*d*., free by post.

Exeter Nursery, Exeter.—Established 1720.

ENGLISH GROWN RAPE, OR COLE SEED.

CHARLES SHARPE AND CO. beg to acquaint the Trade that they can supply any quantity of the above; prices and samples forwarded on application.

Nursery and Seed Establishment, Sleaford, July 7.

HOLLYHOCK SEED.

A. PAUL AND SON have ready for immediate sowing a fine lot of HOLLYHOCK SEED saved from their choicest varieties which have obtained many of the leading prizes during the last three years:—

	s.	*d*.
1st selection, saved from 25 varieties, per packet ...	5	0
2d do. " 12 " " ...	2	6
Good Mixtures	1	0

Also, price 1*s*., AN HOUR WITH THE HOLLYHOCK.

N.B. Free by post, and payment received in postage stamps.

Nurseries, Cheshunt, Herts.

AZALEAS AND ERICAS.

W. J. EPPS has much pleasure in offering the following fine, bushy, well-grown plants, and of the choicest and best varieties, in large 48 and 32-size pots.

AZALEAS 18*s*. per dozen; 5*l*. per 100.
ERICAS 12*s*. and 18*s*. per dozen; 4*l*. and 5*l*. per 100.

These will make very pretty specimens for the ensuing season; all orders to be accompanied with a remittance from unknown correspondents.—Maidstone, July 7.

OPEN AIR CULTURE OF THE MUSHROOM.

PRESTOE'S IMPROVED MUSHROOM SPAWN.—The only acknowledged improvement in this article from the time of OLDAKER.—Sold in packages containing a sufficient quantity to plant 50 feet of bed for 5*s*., with printed description and cultural directions.

W. PRESTOE, in returning thanks to his friends, begs to inform them that hereafter all packages to the value of 5*s*. will be carriage free to any station on the South-Western Line; all packages of the value of 10*s*. free to any station on the Great Western or Berks and Hants Railways.—The trade supplied. Post Office orders payable to WILLIAM PRESTOE, Basingstoke, Hants.

BEAUTIFUL NEW CONIFEROUS PLANT, "ARTHROTAXUS DONIANA."

W. MAULE AND SONS have much pleasure in announcing to the lovers of Coniferous and rare plants that after this week they intend sending out this beautiful tree from the Rocky Mountains, far south of Australia, which mountains are stated by their collector to be covered with snow, and inaccessible from ice nine months out of the twelve. This elegant evergreen tree has stood with little or no injury the two last winters, when at the same time Pinus insignis, Araucaria imbricata have been much injured, and many of our old evergreens quite killed close by their side. The stock of this rare plant is very limited. Established Plants, in 60 size pots, 42*s*. each.

Those gentlemen who have subscribed their orders, and may order this new plant, are respectfully informed that the strictest regularity will be observed in forwarding the strongest plants in rotation as their orders have been and are received.

Stapleton Road Nurseries, Bristol, July 7.

ROYAL BOTANIC GARDENS, REGENT'S PARK.

Also all the new VERBENAS of this season, including Lady Lacon, Wonderful, Blue Beard, Lord Raglan, Mrs. Woodroffe, &c., 1*s.* 6*d.* each, or 18*s.* per dozen, post free, for all of which see advertisement in *Chronicle* of June 23d, and previous numbers.

Post-office orders are respectfully solicited to accompany all orders (unless reference is given), payable at Marsden, Lancashire.

ERICAS.

MESSRS. YOUELL AND CO. beg to submit the following list of choice ERICAS, which can be supplied in good bushy and healthy plants, in large and small 48s, at 12*s.* per dozen:—

ERICAS:—Aggregata, ampullacea, ampullacea carnumbrata, ampullacea rubra, aristata major, Archeriana, Bandoniana, bicolor, Cavendishi, cerinthoides, cer. coronata, Cliffordi, colorans, Coventryana, daphnoidea, Devoniana, depressa, denticulata moschata, echiflora, elata, Ewerianа, eximia, exurgens coccinea, gracilis, grandis, Hartnelli, hyemalis, hybrida, hyacinthiflora, Juliana, Linnæoides nova, L. superba, longiflora, metulæflora bicolor, ovata, perspicua nana, pinifolia discolor, princeps, propendens, p. tubiflora, pyriformis, primuloides, rubens, retorta major, Savilleana, Shannoniana, Shannoniana (Turnbull), Sindryana, splendens, tricolor, tri. rubra, umbellata, ventricosa alba, v. alba tincta, v. breviflora, v. carnea, v. coccinea minor, v. coccinea, v. curta ruba, v. densa carnea, v. dependens coccinea, v. fasciculata longiflora, v. f. rosea, v. f. superba, v. globosa, v. hirsuta, v. magniflora, v. perspicuoides, v. superba, v. tumida, v. tenuiflora, vernix coccinea, Vernonia, Ver. superba, verticillata, vestita tenuiflora, v. coccinea, v. c. tenuiflora, v. fulgida, v. rosea, viridiflora, Westcotti, Westphalingi, Wilmorea superba, Walkeri.

The above are well grown, and of a suitable size for making specimens. The usual discount to the trade when taken per 100.

Royal Nursery, Great Yarmouth.

NEW CABBAGE.—THE CHAMPION OF ENGLAND, which has surpassed everything of its kind during the past severe winter (when nearly every other has failed) and turned well into Cabbage this spring. This Cabbage is of a very dwarf and compact habit, and quite equal in flavour to any yet grown. It has been in the hands of a very excellent gardener for several years, and he has thoroughly proved its superior hardy and good qualities. The stock of seed purchased is very limited, therefore none can be sold by the pound or in large quantities to the Trade this year. E. T. feels confident, from what he has seen of the Cabbage, that it will give the greatest satisfaction to all purchasers. Sold in packets of 1 oz., 2*s.* 6*d.*; or of half an ounce, 1*s.* 6*d.*, postage free.

The TRUE OLD BATH COSS LETTUCE, which Lettuce has never been surpassed by any other yet grown. 1*s.* per packet.

☞ This being the proper time for sowing the following varieties of Hardy Flowering Seeds for blooming next spring, the following undermentioned varieties will give the greatest satisfaction to all purchasers as they have hitherto done for many past seasons:—

SWEET WILLIAM SEED—Saved from 50 of the choicest and most superb varieties. 1*s.* per packet.

ANTIRRHINUM SEED—Saved from all the striped, spotted, and finest shaped varieties. 1*s.* per packet.

Superb HOLLYHOCK SEED—Saved from all the best named flowers out last year. 1*s.* per packet.

SCARLET GIANT BROMPTON STOCK, extra fine. 1*s.* per packet.

PANSY SEED—A few packets from selected varieties. 1*s.* per packet.

AQUILEGIA OR COLUMBINE SEED—Saved from 12 distinct varieties. 1*s.* per packet.

☞ Either of the above packets of Flower Seeds three for 2*s.* 6*d.*

A remittance must accompany every order either in cash or penny postage stamps, when the whole, or any part of the above (as the case may be) will be forwarded.

EDWARD TILEY, Nurseryman, Seedsman, and Florist, 14, Abbey Church Yard, Bath, Somerset.

SUPERB HOLLYHOCKS, SEEDS, ETC.

WILLIAM CHATER begs to offer packets of seed, consisting of 20 varieties, from his best Show Hollyhocks at 5*s.*; 12 varieties, 2*s.* 6*d.*; and from good double sorts, 1*s.*

Superior Quilled German and French Asters, in 12 varieties, mixed, 1*s.* per packet; separate, 2*s.* Fine Quilled African Marigolds, 6*d.* per packet.—Saffron Walden Nurseries.

NEW POMPONE CHRYSANTHEMUMS. The following 13 best new varieties of last season for 13*s.*, or 1*s.* 6*d.* each, viz., Anna Bullen, Aurora Borealis, Bob, Brilliant, Consuelo, Comte Achille Vigier, John Salter, La Radieuse, Madame Passy, Pluie d'Or, Rococo, Zebra, and Doctor Bois Duval.

NEW LARGE FLOWERING CHRYSANTHEMUMS.—The following 7 best new varieties for 9*s.*, or 1*s.* 6*d.* each, viz., Auguste Mie, Annie Henderson, Hermione, La Prophete, Madame Labois, Prince Jerome, and Phare de Messine.

GLOXINIAS.—The following set of 11 new varieties of last season may now be had of good flowering plants, for 25*s.*, viz., Duke of Wellington, Eleanor, Elegantissima, Erecta magnifica, Eugenia, Exquisite, Grand Sultan, Lady Franklin, Magnet, Prince of Wales, and Sir C. Napier.

WOOD'S DUCHESS OF NORFOLK ROSE, strong plants, 3*s.* 6*d.* to 5*s.* each.

Goods carriage free (not under 20*s.*) to all the London termini, and all stations on the London and Norwich Colchester Line. Plants added gratis with orders of 40*s.* and upwards.

COMPLETE CATALOGUES on application for six penny stamps, or the Spring Catalogue alone for three penny stamps, or gratis to our customers who may not have received them.

Seed and Horticultural Establishment, Sudbury, Suffolk.

The Gardeners' Chronicle.

SATURDAY, JULY 7, 1855.

MEETINGS FOR THE ENSUING WEEK.

WEDNESDAY, July 11—Horticultural Gardens ..... 2 P.M.

THE crosses which appeared on the Exhibition tables of the Horticultural Society last month excited unusual attention, especially the beautiful Princess Royal Rhododendron from Messrs. VEITCH. So many other striking results of muling are also now beginning to appear in gardens, that the process is likely to be carried on with more activity than ever. It therefore seems to be worth while to consider whether recent examples throw any new light upon the result that the operator has a right to anticipate from his experiments.

GÆRTNER assures us that, in the course of his very numerous and much varied experiments he found that no certain result can be anticipated. The late Dean of Manchester and others have believed, on the contrary, that upon the whole the properties of the male plant will be most conspicuous in the hybrid. To test the value of these opinions we take the following eight cases in which the history of the mule is known with certainty. For the sake of brevity we venture here to employ the signs of sexes in use among botanists, viz., ♂ for the male, ♀ for the female:—

1. MULE. *Anemone vitifolio-japonica.**

♂ Anemone vitifolia; ♀ An. japonica.

Result. Flowers and hardiness of ♂; colour intermediate. A very valuable variety.

2. MULE. *Anemone japonico-vitifolia.**

♂ Anemone japonica; ♀ A. vitifolia.

Result. Tenderness and ragged flower of ♂. A worthless variety, no longer cultivated.

3. MULE. *Cereus speciosissimo-crenatus.**

♂ Cereus speciosissimus; ♀ C. crenatus.

Result. Colour of ♂; habit nearly of ♀.

4. MULE. *Aquilegia fragranti-californica.**

♂ Aquilegia fragrans; ♀ A. californica.

Result. Habit and flower of ♂; colour intermediate.

5. MULE. *Rhododendron javanico-jasminiflorum, or Princess Royal.*

♂ Rhod. javanicum; ♀ R. jasminiflorum.

Result. Form of flower intermediate; colour derived from ♂ by the separation and retention of its rose and the rejection of its yellow (a very curious, and as far as we know, unique case). Leaves and habit intermediate.

6. MULE. *Mandirola Roezli.*

♂ Scheeria mexicana; ♀ Gesnera zebrina.

Result. Colour derived from ♂; whole habit and leaves from ♀.

7. MULE. *Mandirola picturata.*

♂ Gesnera zebrina; ♀ Achimenes mexicana.

Result. Inflorescence and flowers of ♂; leaves and colour intermediate.

8. MULE. *Begonia miniato-opuliflora.*

♂ Begonia miniata (fuchsioides); ♀ B. opuliflora.

Result. Inflorescence and colour of ♂; leaves more those of ♀.

In these instances, taken perfectly at random, it is evident that for the most part the ♂ predominates, especially in Nos. 1, 2, 4, 7 and 8; and this supports Dean HERBERT's views; but in 3, and 6, the effects of the ♀ are most conspicuous; and in No. 5 the issue is nearly equalised; even here, however, the colour is derived from the ♂, as also is the case in 1, 3, 4, 6, 8, and in a less conspicuous degree in the other cases. The most curious result is that in both 6 and 7 Gesnera zebrina overcame the peculiarities of its consorts, whether used as ♂ or ♀. This points to a conclusion not yet drawn, viz., that in some cases it is merely because of its inherent vigour of constitution that a species prevails, and not because it is ♂.

Is it not worth the while of experienced hybridisers to endeavour to multiply this kind of evidence, and to endeavour to extract from it the general facts which possibly lie concealed among the loose statements with which alone in so many instances we now have to deal? Were that practicable muling would be reducible to system, and no longer remain, what it now is, mere chance work. We throw out the suggestion for their consideration; especially for that of such ingenious experimentalists as our ISAAC ANDERSONS, TREVOR CLARKES, GOWENS, INGRAMS, and VEITCHES.

A FEW weeks since we had the satisfaction to announce that Lord PALMERSTON had conferred the important appointment of Master of the Mint upon one of our most learned and able men of science. It is with no little pleasure that we find ourselves again called upon to report a similar act, on the part of his lordship's government, in the Royal Botanic Garden, Kew.

It has long been obvious that the duties of the learned director of this great national establishment were becoming overwhelming, and beyond the power of the most indefatigable public officer to execute without assistance. The garden, the pleasure grounds, or rather the park, the infinite multitude of plants from all quarters assembled in the

* N.B. Those marked with an asterisk were raised in the Garden of the Horticultural Society by Mr. George Gordon.

hothouses, the greenhouses, the parterres, and the arboretum were in themselves far more than enough to be controlled by any one pair of eyes; and when to this was added the magnificent museum, and the prodigious herbarium, now forming part of the Kew establishment, the appointment of an assistant to the director became inevitable.

We now find that Government, upon the representation of Sir Wm. Molesworth, has placed the herbarium, the library, and the strictly botanical part of the garden under the charge of Dr. Hooker, whose name is already familiar to men of science all over the world as one of our most distinguished naturalists, and whose learning and active superintendance will soon render Kew as celebrated for the accuracy of its nomenclature as it already is for the extent and practical value of its collections. In this case we have again a proof that Lord Palmerston will put a right man in a right place when he has the opportunity. Science, at least, must gratefully acknowledge its obligations to the noble lord, when it finds that in a few brief months he has selected three such men as Sir Roderick Murchison, Dr. Graham, and Dr. Hooker, for the scientific appointments which have fallen to his disposal.

While speaking of the Botanic Garden, Kew, we may also announce the gratifying fact that the House of Commons has just voted 3000*l.* towards the construction of a new museum. This sum will permit a good commencement to be made, and it will be easy to make additions to the building as the necessity for them arises. We trust that, whatever plan may be adopted in the construction of this building, very ample space will be left for future enlargement. The public lives in the hope of one day seeing the whole of the botanical collections now at the British Museum transferred to Kew, and an excellent opportunity is now afforded of making provision for their reception. Relieved of this part of its accumulations the Museum will be able to find room for the display of objects better suited to London than vegetable preparations, and without calling upon Parliament for some prodigious sum for new buildings in a place overcrowded with buildings already.

It is difficult to overestimate the practical importance of the Museum which Kew is forming, for in such a garden, and in such a garden only, is it possible to combine both living and dead evidence concerning the œconomical, medical, or ornamental value, or the scientific application of the innumerable races of plants which Providence supplies for the use of man. A sketch of its principal contents, just published,* shows the progress that has been made, and the additions which are most required in the establishment. What interest is taken in it by the visitors to Kew is seen by the crowded state of the present narrow rooms, through which, when the public is admitted, we find it difficult to force a way. But upon this point, and some others relating to the history of the Museum we ought to quote Sir William Hooker's own words:—

"In the year 1847," he says, "her Majesty Queen Victoria was graciously pleased to command that those grounds at Kew which had been devoted to the kitchen and forcing department should be added to the Royal Botanic Garden, together with the stoves and other buildings. An excellent brick structure, occupied in part by the dwelling of one of the foremen, and in part as rooms for preserving fruit for the use of the Palace, was thereby vacated; and it occurred to the director that, with a little alteration, this might be made a deposit for all kinds of useful and curious *vegetable products*, which neither the living plants of the garden nor the specimens in the herbarium could exhibit; and that such a collection would render great service, not only to the scientific botanist, but to the merchant, the manufacturer, the physician, the chemist, the druggist, the dyer, the carpenter and cabinet-maker, and artisans of every description, who might here find the *raw material* (and, to a certain extent, also the *manufactured* or *prepared article*) employed in their several professions, correctly named, and accompanied by some account of its origin, history, native country, &c., either attached to the specimens or recorded in a popular catalogue. The suggestion was communicated to the heads of the establishment, the Commissioners of her Majesty's Woods and Forests: leave was asked to convert the building (at first in part), into a museum, and orders were given for one large room to be formed, with a gallery, side-lights, and sky-light, and fitted up with glazed mural and table cases. The foundation of the museum consisted of the director's private collection (presented by himself), some few objects already belonging to the garden, chiefly fruits and seeds, and some given by Mr. John Smith, whose son, Mr. Alexander Smith, received the appointment of curator. Scarcely were the doors open to the public, when specimens of various kinds were received from all quarters, so that it soon became necessary to enlarge our accommodation, till, in the present year (1855), all the ten rooms of the building and all the passages are completely filled, and a very large quantity of articles are put aside for want of space to exhibit them. We have now applied to the Crown for an entirely new structure, suited to the increased and continually increasing collection, and worthy alike of the noble gardens of which it is a part, and of the nation. One has but to see the crowds frequenting in summer the existing museum (so great that the director finds it frequently impossible to enter at public hours with distinguished visitors, who desire to have objects explained to them), to be satisfied of the deep interest the public take in such a collection—a collection that at once appeals to the faculties and understanding, showing the practical uses of the study and application of botany, and the services thus rendered to mankind. It has done more to recommend and to popularise (if I may use the expression) the science that communicates a knowledge of the vegetable creation, than all the princely Palms, the gorgeous Water-Lilies, the elegant Ferns, &c., &c., which grace the tropical houses of these noble gardens. Here (in these gardens) it is true the public are privileged to see growing plants of 1. the *Cocoa-nut;* 2. the *Vegetable Ivory Palm;* 3. the *Wax-bearing Palms* of *Brazil* and of the *Andes;* 4. the *Piaçaba Palm;* 5. the *Coco de Mer;* 6. the *Doum Palm;* 7. the *African Oil Palm;* 8. the *Chocolate, Tea, Coffee,* and *Sugar-bearing Plants;* 9. the *Papaver somniferum;* 10. the *Bermudian Juniper;* 11. the *Isonandra Gutta;* 12. the *Chinese Grass Plant* (so called); 13. the *Siphonia elastica;* 14. *Rice-paper Plant* (so called) of China, and a hundred others of equal interest; but the visitor receives twofold gratification and twofold instruction, if with these several vegetable forms in his mind, he can enter an adjacent building, and there contemplate their *products*, and see, as it were, the uses which the ingenuity of man has derived from them:—1. the food and raiment, the milk, the oil, the wine (toddy) the cups and bowls, cordage, brushes, mats, in short, the 365 articles ('as many,' the Hindoos say, 'as there are days in the year') afforded by the common *Cocoa Nut* alone; 2. the ivory-like articles made from the seeds of the *Vegetable Ivory Palm;* 3. the excellent and now commercial wax, yielded by certain *American Palms*, and deposited by nature on their trunks and leaves; 4. the useful nuts (for turnery), and still more useful fibre (for the best brooms and brushes) of the *Piaçaba*, as the streets of our great cities can testify; 5. the curious double nuts (with their flowers) of the *Coco de Mer* of the Seychelles Islands, once, while ignorantly supposed to be the product of a submarine tree and only known from having been found floating in the Indian Ocean, valued at the price of a freighted ship, being an antidote to all poisons, 'mirum miraculum naturæ,' says Rumphius, 'quod princeps est omnium marinarum rerum, quæ raræ habentur;' 6. the singularly forked stems (other Palms have unbranched stems), and the large ginger-bread-tasted fruits of the *Doum Palm* of Upper Egypt; 7. the fruits and nuts of *Elais Guineensis*, which yield the Palm oil of western tropical Africa, now largely imported and consumed by Messrs. Price and Co.; and not those only, but the oil itself and the several preparations it undergoes in its progress towards the perfect candle, in a series of samples presented by that truly philanthropic company; 8. the various and generally well-known preparations of *Chocolate, Tea, Coffee,* and *Sugar*, the latter extracted from an *American Maple* and from *Beet-root*, as well as from the *Cane;* 9. *Opium* in its various stages, from the "*poppy head*," to the pernicious ball prepared for commerce; 10. the progress of pencil-making of the wood of a *Juniper*, improperly called Cedar; 11. the various interesting products derived from the *Gutta Percha plant;* 12. the fibre or raw material and cloth, made from the *Chinese "Grass Plant,"* in reality a *Nettle;* 13. cases filled with the various preparations of the *best Caoutchouc* or India rubber tree of Pará (*Siphonia elastica*), presented by Messrs. Macintosh; 14. the beautiful substance called Chinese *Rice-paper*, long supposed to be a preparation of rice, but here shown to be the exquisite pith of a new plant (*Aralia papyrifera*), only found in Formosa, for the knowledge and for living plants of which we are mainly indebted to Sir John Bowring. The last-mentioned discovery is only one of many instances (as will by-and-bye be shown) of the *origin* and history of commercial vegetable products, of which we should yet have remained in utter ignorance, but for the formation of this Garden and this Museum. Information of this kind cannot fail to be acknowledged and appreciated in a great mercantile country by every intelligent mind, and even by persons not specially interested in trade or commerce."

* Museum of Economic Botany; or a Popular Guide to the Useful and Remarkable Vegetable Products of the Museum of the Royal Gardens of Kew. By Sir W. J. Hooker, K.H. Longmans. 1s., 12mo.

We learn that a deputation from the Horticultural Society of London, consisting of Dr. Royle, as Secretary, Sir Wm. Hooker, Mr. Bentham, and Mr. Wentworth Dilke, having been formed for the purpose of visiting the French Horticultural Exhibition, it was received last Friday by Messrs. Decaisne and Morel, Vice-Presidents; M. Aubry, the Secretary; M. Loyre, the architect of the gardens; and the garden staff. On Thursday, the deputation was to dine with the Committee of the Exhibition. We hear that the exhibition is a good one, quite as good as a permanent one can well be. Details upon this subject are in preparation, and will appear as soon as we receive them.

VEGETABLE PATHOLOGY.—No. LXXIX.

331. Perianthomania (*Multiplication of Bracts, Sepals, &c.*)—In adopting the nomenclature of Re, to avoid the introduction of needless terms, I am obliged to take the word perianth, not only as indicating parts below the petals, according to the usage of some authors, but in the more legitimate sense also, as applied to those cases in which the petals and sepals are physiologically one. All these organs, then, by whatever name they are known, are subject to abnormal multiplication; the sepals, however, to less extent than the others. I am not speaking of those cases in which the bractes simply become foliaceous or assume the colours of the corolla or other vivid tints, because this may take place normally, but of such cases as that presented by the variety of Carnation known by the name of Wheat-ear Carnation. The bractes which subtend the calyx are here multiplied and disposed symmetrically round it, so as to present a general resemblance to a Wheat-ear. The calyx is generally abortive, but whether the plant ever bears seeds when in this condition I am unable to say. The variety is not common in gardens, and I have had no opportunity of examining it accurately. This, however, has not been the case with the variety of Sweet William alluded to above, of which I have a plant in my own garden, and of which a figure is subjoined. The structure is entirely homologous with that of the Wheat-ear Pink; there is the same repetition of the bractes, and the same more or less imperfect fruit succeeding them. In both instances the bractes undergo no change of tint. In the Sweet

William, at least, there is an attempt to form perfect fruit, which undergoes some curious modifications of which I shall have occasion to allude in the sequel. I have not myself seen seed, but Ré says that he has never observed "any impediment to accrue from the affection to the reproduction of the species." This, however, is scarcely consistent with what follows in his book, and must be taken with some latitude. There is indeed, no reason why fruit should not occasionally be produced, though the natural tendency of such multiplication is to cause the other necessary organs to degenerate or to suppress them altogether. It is easily conceivable that such productions should require pretty good soil for their maintenance; but, if so, no argument is afforded in proof that extreme richness of nutriment has had anything to do with their production, though it may tend to preserve them when once produced. A similar affection often takes place in Lupines, but the effect is to produce leafy branches instead of flowers, without any especial arrangement indicating the precise relation of the several leaves. Such an effect may be produced only in a single branch of a common plant, and is certainly not always due to superabundant richness of soil, as I can myself testify from observations which have come before me. The propagation of such varieties can only be carried on with certainty by means of cuttings from the parts affected. Seeds, if produced, would very probably yield only the normal plant. The variegated Primrose, in which the colours of the corolla are partially assumed by the multiplied sepals, affords a good example of sepalomania, of which but few instances occur. The variety of Foxglove (described in *Gard. Chron.* 1854, p. 660) is very instructive. In

this case brighter colours are faintly assumed by the bractes, new branches are often produced from their axillæ, as is also the case with the Lupine just mentioned, and the capsule, as in the Sweet William, undergoes curious changes.

332. If the true petals of Endogens be taken as part of the perianth, we have multitudes of instances in which the lobes of the perianth are multiplied, and that frequently with such symmetry as to constitute some of our most beautiful floral ornaments, as in the case of the double Poetic Narcissus and Oriental Hyacinth. The multiplication may be so complete as to preclude the formation either of stamens or pistils; many flowers are, however, fertile, and give rise by impregnation to new and beautiful varieties. The object of the cultivator here is to maintain the peculiarities of each variety, and, while in the Tulip a rich soil is fatal, by giving a tendency to produce extra petals or coloured bractes destructive of the symmetry of the plant, a generous soil is favourable to the perfection of many double flowers, especially where the tint is uniform. It is often complained that the finest bulbs exported from Holland will not retain their characters in this country. There may be something in the soil and climate of Holland which is peculiarly favourable to the perfection of such plants, but far more depends upon the treatment. Where proper attention is paid to the soil, where some such means are taken to protect from cold as the covering the surface with a thick coating of semi-fluid dung, which is practised in Holland, and where a proper zest is given to the plants by removing them every year at the proper season and for the proper time, varieties will retain their qualities for years. I have myself seen an admirable collection of Hyacinths which displayed great beauty and quality for a long period without any fresh importations, and that this is possible is plain from the far more difficult case of Tulips.

333. In the case of Orchids, there is a natural tendency in the petals to assume various forms, as indicated by the multiplicity of configuration assumed by what is called the lip. Such forms were once considered the most certain generic distinction, but the occurrence of flowers indicative of three distinct genera in the same stem of Catasetum has rendered such conclusions far less certain. How far it may be right to call such changes diseases, or which are the normal forms it is at present perhaps difficult to say, but the subject at least requires a passing notice. *M. J. B.*

NEW RAT TRAP.

The accompanying sketch represents a rat trap, which is regarded as superior to any trap now in use. It possesses the advantage of not getting out of order, and of not requiring to be often looked after, and consequently of not rendering the rats suspicious and timid. The caught rat is forced to go to such a distance, that when drowning he will not alarm the others. The apparatus is so contrived, that even a rat which has been caught and let go will not be able to avoid being caught again, as there is nothing whatever to arouse suspicion. The truth of this has been proved by catching rats, marking them, and finding them in the trap again after they had been set at liberty.

To insure success, the apparatus should be placed out of the way of children and other persons likely to meddle with it. Some trunks and branches of trees are piled up so as to afford a cover for the vermin, and to enable them to run up to the board (*a*), which is placed horizontally, and has a trap (figs. 1 and 2) let into it. This trap, when the rats run on it, gives way as shown at *b*, fig. 1 (it ought to be 12 or 15 inches long, and 3 or 4 broad); *c* is a compartment made with diverging sides, well fitted together, so that a rat in it cannot by any possibility get up again; *d* is a passage leading to a sufficient distance from *c*; *g* is the pile of wood already mentioned. The passage *d* leads into a tub (*e*) containing some water, and placed at a short distance from the wall or partition (*d*). A little platform (*x*), so slight as to give way under a very gentle pressure, and then to

recover its position, is fastened to the inside of the tub opposite to the mouth of the passage (*c*). Above the platform there should be a small hole (*z*) in the side of the tub to admit a little light, which induces the rats to jump from the end of the passage (*e*) on to the platform (*x*). The tub should be partly sunk into the earth.

The great point is to choose a good situation. The apparatus should be in a place where the rats will not be disturbed, and some straw and ears of corn should be scattered about the trap so as to entice them to get upon it. The best bait is a little malt slightly coloured and scented with oil of carraway.

The trap (*i*, fig. 2) should turn on a pivot (*h*), and be counterpoised at *l*, so as to recover its horizontal position after giving way; and the principal bait should be placed at the back of the trap, as is shown by the ears of corn at *f*. The more certainly to deceive the rats, it may be as well to set the trap fast for a few days. The counterpoise ought to be sufficient to resist a very slight pressure, for rats are extremely wary, and they try the ground with their fore feet as they advance. The trap ought not to give way until a rat is on it. When a rat is in (*c*), it runs along the passage (*d*); and being attracted by the light at *z*, jumps on to *x*, and falls into the water. The platform immediately springs back into its place, and another rat follows. If the apparatus is well made, there is no noise whatever. The tub has only to be emptied as occasion requires, and, as already stated, it is not placed where the rats are congregated.

[We had caused this to be translated from the "Flore des Serres," and the cut to be prepared, before we discovered that the original occurs in the "Farmers' Magazine," to which periodical the contrivance, which seems an ingenious one, must be ascribed.]

NEW GARDEN POTS.

In reference to the specimens of garden pots represented below, perhaps I may be permitted to state, that in the first instance they were intended to be used for Seakale in winter. They consist of two parts: the one having the double rim, so as to form a groove or gutter, is that wherein the plants or crowns are planted; the other, which is inverted and fits into this groove or gutter, forms the blanching pot. In using these pots for

growing and blanching Seakale in winter, by having the plants taken up in the autumn as soon as they are thoroughly ripened, and planting them thickly in any mould in a shed or some sheltered place where they will at all times be ready to hand, a very nice succession may be obtained throughout the winter. If the pots are filled with plants (the number of pots depending on the consumption) in the first week in November, and introduced successively into the forcing department, say one each day, or at intervals of two or three days, by the time the last pot is taken in the first will be fit for use; and as the Kale is being cut, so the pots should be filled with fresh plants from the reserve bed, and a constant supply maintained; the Kale can be grown in these pots in almost any place where the temperature is warm enough to excite the plants into growth. If fermenting material is used the pots can be partly plunged in a bed of coal ashes in some sheltered corner or shed, and covered, as in the ordinary way, with leaves, &c. Much less space is occupied, the temperature is more uniform, and the bed easier of access in bad weather, as it need not necessarily be exposed to wind, rain, snow, and frost. When the pots are not required for Seakale they can be used in every way in the cultivation of flowering plants as common garden pots, or for sowing in, or protecting seedlings from frost, rain, and vermin. By placing the blanching pot over any choice seedlings they are secure from injury; dashing rains are rendered perfectly harmless, as no wet whatever can reach the young plants, it being carried off by the inside rim, which is higher than the outside one. These pots are also intended to be used as propagating pots and pans—the glass shade instead of being placed inside is pressed into sand in the groove; by adopting this mode the condensed vapour is conveyed into the groove, and the cuttings can be inserted close to the edge of the pots, where they are found at all times to emit roots the most readily. In syringing or watering there is no

danger of committing injury to the cuttings be they ever so choice, as the water in falling on the glass is conveyed over the side of the pots; whereas in the use of the common pots with the glasses inside, great care is necessary to prevent mischief from the water falling on the glass finding its way in amongst the young seedlings, cuttings, or plants. The pans are likewise adapted to the culture of Ferns, Mosses, &c. &c., and manufactured in an ornamental form (either pots or pans), they would in every way serve to grace the plant house, conservatory, sitting, or drawing-room; but as one gentleman observed when the contrivance was submitted to him, to specify all the uses and advantages of the pot in question would be to enter into a very lengthened detail, &c. &c. *Geo. Fry, Gardener to Mrs. Dent, Manor House Gardens, Lee.*

New Plants.

135. Pinus Beardsleyi. *A. Murray, in Edinb. new Phil. Journal*, i., 286, t. 6.

"The tree is of great beauty and size; one which was cut down measured 123 feet in height, and 44 inches in diameter at the stump. Another tree near it measured 17 feet 4 inches in circumference at 3 feet from the ground. The stem was a very handsome column about 30 feet to the first branch; timber good and clear. It was found on the top of a mountain, in lat. 41° N., at the same altitude as *Pinus Jeffreyi* and *monticola*, and *Abies grandis*, and higher than *P. Benthamiana* and *Lambertiana*.

"This and the following species (*Craigana*) seem to have more affinity with *P. Benthamiana* than any other described species. But the present species has the points of the umbo of the scale pointing towards the base of the cone, while in *Benthamiana* they point to the tip; the cone of *Benthamiana* is 5 inches long, while *Beardsleyi* is only 3 inches. The leaves are 11 inches in length, while in *Beardsleyi* they are only 6 inches. The sheath of the leaf in *Benthamiana* is an inch long, while in *Beardsleyi* it is only an eighth of an inch. The wing of the seed of *Benthamiana* is much larger and longer than that of *Beardsleyi*. The timber of *Beardsleyi* is homogeneous all through. The heart of *Benthamiana* is redder than the sap-wood, and the sap-wood occupies a great breadth of the stem. *Beardsleyi* grows much further up the mountains than *Benthamiana*. The distinction between the cones of these trees will be sufficiently seen from the rough etchings which I have given. The figure of the cone of *Benthamiana* is copied from that given by Hartweg. Like all that gentleman's figures and descriptions, it is very characteristic of the cone as it is generally found, but it is inaccurate as a representation of the cone in its complete state, in so far that it represents the hooked umbo as pointing to the base. In point of fact it does take a bend in that direction, but the prickle which terminates the umbo takes a sudden turn backwards, and points to the tip like the following species (*Craigana*). The prickle in the specimen, from which Hartweg's figure has been taken, has previously been rubbed off, which gives a false impression of the direction of the umbo. There can be no doubt about this, because my brother found all Hartweg's localities so strictly correct that he could recognise the very patches of different trees that he describes having met; and he took his observations on the cones, &c., of *Benthamiana* from the very clump of that tree described by Hartweg, as found by him near Santa Cruz. There was no other tree, or clump of trees, for a great distance, with which it could be confounded.

"There is also some resemblance between this Pine (*Beardsleyi*) and *P. ponderosa*, as was well suggested to me by Dr. Lindley; but the shape of the cone and the size and shape of the seed and wing sufficiently distinguish it. In *P. ponderosa* the cone tapers to both ends, while in this it tapers to the point. Its seed does not appear to be speckled in any figure I have seen (I have not seen any specimen of the seed itself), while this is. The sheath of the leaf in *P. ponderosa* is smooth longish, fine, and tightly fitting, whereas in this it is short, corrugated, and rough; and the *ponderosa* is nearly twice as long, being 9 to 11 inches in length, in place of 6 inches. Its leaf also wants (or nearly so) the projecting points which roughen that of *Beardsleyi*, so that the leaves can be diistinguish by the feel, or drawing them forwards between the fingers."

136. Pinus Craigana. *A. Murray, in Edinb. new Phil. Journal*, i., 288, t. 7.

"It differs from *P. Beardsleyi* (the preceding species) in having the prickle of the scale pointing towards the tip instead of the base. The prickle, too, is strong and firm in *Craigana*; in *Beardsleyi* it is small and weak. The apophysis, or excrescence on the exposed part of the scale, is smaller in point of space, but more prominent in *Craigana* than in *Beardsleyi*, which has the exposed part somewhat flat, while in *Craigana* the upper part projects over the lower. The wing of the seed of *Craigana* is shorter, and relatively broader. The seed is nearly twice the size of that of *Beardsleyi*, although the cones are about the same size. The leaf of *Craigana* is finer than that of *Beardsleyi*, and not so long. The sheath of the leaf is finer, and considerably longer.

"*Craigana* was found on the same mountains as *Beardsleyi*, but growing lower down, and below it again appeared *Benthamiana*. It spreads its branches wider from the stem than *Benthamiana*, and sheds its seeds a month later. My brother and I have dedicated this handsome Pine to Sir William Gibson-Craig, Bart.,

whose enthusiasm has done so much to promote the cultivation and introduction of new Pine trees, and who, in particular, was one of those who chiefly conduced to my brother undertaking the expedition, of which this Pine forms part of the fruits."

Home Correspondence.

Onion Failure.—In your Paper of the 23d of June, in that interesting subject "Vegetable Pathology," there is a notice of a garden near Doncaster where the Onion crop often fails. I have sometimes had failures in my Onion crop, but since I adopted the following method of growing or manuring them I have had good crops. The soil is nearly related to a variety of formations, for under and around us we have coal, limestone, ironstone, shale, sandstone, whinstone, or basalt, and plenty of erratic boulders belonging to other formations. Good Onions may be had where there is very little soil, and may be grown in any formation, from the granite to the peatmoss. The manure I use is old stable dung, commonly the remains of old hotbeds, well cut up and turned over several times in autumn and exposed to the vicissitudes of winter. The ground on which the Onion is intended to grow may be dug in winter or spring without any manure being dug in. When the season and soil are fit for the seed, a bed may be marked off 3½ feet or 4 feet wide, and as long as may be wanted or the ground allow. The surface soil may be taken off to the depth of 1½ inch, and put to the right and left of the bed, when a quantity of prepared manure may be wheeled on, which should be in a soft, moist state, and which would almost work like mortar when beat with the back of the spade; spread it to the depth of 4 inches at least; after spreading, tread it well with the feet; after treading, beat it well with the back of the spade, and smooth the surface; the seed may be sown in rows upon the surface of the manure, or broadcast; the earth which was taken off should be spread over the seed, and afterwards raked. Bed after bed may be done in the same manner until the principal crop is put in, when the whole may be dressed up in a neat manner. Early Horn Carrot treated in the same way does uncommonly well. Gardeners have sometimes to steal a march upon late springs, like the one that is past. It was late in the season before the frost left us, and the Onion crop was behind the time when it is commonly sown. I tried an experiment with a quantity of Onion seed to give it a start before it was sown; the seed was mixed with about a gallon of fine leaf-mould and put into a flower pot, which held it with ease, and put in the warmest part of the greenhouse, where it remained a week, receiving at times a little moisture when the surface of the pot became dry; at the end of the week it was turned out of the pot, and well mixed with the hands, changing the position of the seed as much as possible, when it was put into the pot again: in the second week it germinated, and it was near the end of the second week before an opportunity was obtained for sowing it; the seed was nearly all sprung, varying in length from a quarter of an inch to three-quarters of an inch. I thought it was rather bad treatment it was getting—taking it from its warm bed and putting its blanched naked limbs into cold moist manure; I expected to be paid back for my cruelty towards it: however, I was disappointed;—the seed got the start and kept it, and the bed in which the sprung seed was sown is the earliest and best Onion bed in the garden. *P. Mackenzie, West Plean, Stirling.*

Stem Roots of Vines.—As this seems to be an age of opposition, *i. e.* of protecting and non-protecting, of fermenting and non-fermenting material, for Vine borders, perhaps you will permit me to relate my experience in the matter. Your correspondent (see p. 358) says: "Were warming the borders generally adopted, roots on stems would disappear." I have two Vineries, one for early forcing, the other a late house. I have been a strong advocate for warming the border of the first house by fermenting materials, and have for years kept up a regular heat at a great deal of trouble. But the Vines never gave me satisfaction; the crop was thinnish, the bunches shanked very much, the seeds of the berries protruded through the skin, and there were plenty of roots on the stems, which I attributed to the want of liberal ventilation in the early part of the season; for in my late house no roots ever made their appearance. Last winter I thought I would try what might be done without heating the border. By the middle of December I covered the latter with litter and leaves, at an average thickness of 9 inches, being thickest next the house, and sloping outwards. This I protected with waterproof covers, and there it lay till the first week of June, when it was removed. I may state that the roots under the surface form a complete network. I have at this time a fine crop of well swelled and well-coloured berries with no bursting, little or no shanking, and no roots on the stems of the Vines, which are in a fine healthy condition. If covering the borders and keeping them dry without heating were to answer every purpose, what a labour would be saved! *G.*

Tares of Scripture.—In reading the parable of the Wheat and the Tares in the 13th chapter of Matthew, I have often wondered what kind of plants the Tares were. We are told by some writers that they were a kind of Pulse; they cannot well be plants of that nature, or the servants must have been very ignorant not to have known the difference between Wheat and Pulse until they were in fruit, for we are told "when the blade was sprung up and brought forth fruit then appeared the Tares also." The translators of the New Testament from the Greek to the Latin, such as Beza, appear to have been at a loss for a word in Latin for the Greek Zizania, or Tares of our translation, for the Greek word is not changed in the Latin translation. We have the Zizania aquatica or Canada Rice, a water Grass from North America, which cannot be the Tares of scripture. I am inclined to think that the Tares would be a kind of Grass which would have some resemblance to the variety of Wheat Grasses. I find that in some Greek and Latin dictionaries Zizania is translated Lolium, and in a Latin-English dictionary Zizania or Zizanium is Darnel or Ray. One should almost come to the conclusion that the Tares in the parable would be Lolium temulentum or drunken Darnel. If I am wrong in my guess I hope some one will put me right. *P. Mackenzie.*

New Mode of Propagating Currants.—In the spring of last year an old Currant bush was cut down, and a number of the branches made into Pea-sticks; they supported the Peas, and the greater part of them struck root in the ground. They were allowed to remain, and this season they are a row of tall bushes bearing fruit. *P.*

Effect of Spring Frost on Cherry Trees.—Late in May the blossom of many fruit trees was nearly as stiff as icicles by means of frost, and many of them suffered much; among the rest a May Duke Cherry. All, however, were not destroyed, for there will still be a good sprinkling of fruit over the tree; but the most remarkable thing about it is this; about 18 inches from the ground there is a branch with some Cherries upon it, full grown, and well coloured, and may be eaten any time, as far as ripeness is concerned. They were as much exposed to all appearance as the rest of the fruit on the same branch, yet on each side of the ripe fruit the young Cherries are as small as green Peas, and as green, and will not be ready for a long time to come. *M.*

Societies.

ROYAL BOTANIC, REGENT'S PARK, *July* 4.—The Society's last fête of the season took place on this occasion under very favourable circumstances as respects weather, and the exhibition itself, as a whole, was good for July. Stove and greenhouse plants were produced in abundance, and there were the usual banks of Orchids, though the latter were, as might have been expected, not near so good as they were in May or June.

An admirable collection of 16 STOVE and GREENHOUSE PLANTS was furnished by Mr. May, gr. to H. Colyer, Esq. It contained two well flowered Allamandas, Dipladenia crassinoda, Rondeletia speciosa, in luxuriant health, and with very highly coloured flowers; Phænocoma proliferum, in beautiful condition; and one of the best of the Everlastings, the whole being relieved and set off to much advantage by the introduction of such white flowered plants as Dracophyllum gracile, white Vincas, and Heaths. Mr. Barter, gr. to A. Bassett, Esq., contributed large and fine plants of Phænocoma proliferum; Ixora javanica, covered with flowers, which were however scarcely in perfection; the pale yellow Allamanda grandiflora, a red Azalea, Statice Holfordi, Erica tricolor, and Vincas. Mr. Green had Azalea lateritia still in good bloom, Mitraria coccinea, a beautiful Everlasting, Allamanda cathartica, Stephanotis floribunda, and Rondeletia speciosa in good condition, though scarcely so luxuriant or brilliant as Mr. Colyer's plant. Mr. Rhodes had a group in which were the yellow Relhania squarrosa, and Statice Holfordi, both beautiful specimens.

Of collections of 12 STOVE and GREENHOUSE Plants Messrs. Fraser produced Relhania squarrosa, the showy Kalosanthes miniata, Phænocoma proliferum, two white Vincas, two Allamandas, Stephanotis floribunda, Ixoras, and Heaths. Mr. Cutbush, of Barnet, sent Ixora javanica, a noble bush, but its flowers were scarcely forward enough; a most beautiful Erica Massoni, Dipladenia splendens, and crassinoda, Phænocoma proliferum, and the very fine variety of Cape Heath called obbata.

In collections of 10 STOVE and GREENHOUSE PLANTS, Mr. Frost, gr. to E. L. Betts, Esq., communicated an extremely well cultivated group, in which were Statice Holfordi, loaded with flowers, two Allamandas, Roella ciliata, one of the best plants of the kind perhaps ever seen, being covered with blue cup-shaped blossoms all in the greatest perfection; Dipladenia crassinoda, a Kalosanthes, and Pimelea decussata, the latter highly coloured, but with flower heads rather small. Mr. Taylor, gr. to J. Coster, Esq., furnished two nice Everlastings, two Cape Heaths, and Dipladenia crassinoda which showed how profusely this charming plant can be flowered even in a small state. Mr. Peed had two noble Cape Heaths, one of which was the pretty E. Aitoni; also Cyrtoceras reflexum, robust; but with flowers devoid of colour, and white and red Vincas. Among Mr. Hamp's plants the more conspicuous were Relhania squarrosa, Cyrtoceras reflexum, and Mitraria coccinea, the latter well flowered.

Of six STOVE and GREENHOUSE PLANTS, the best, came from Mr. Frost, gr. to E. L. Betts, Esq., who sent Allamanda cathartica, a Kalosanth, Polygala oppositifolia, an Everlasting, and a noble Erica ferruginea. Mr. Williams, gr. to Miss Traill, produced the beautiful variety of Cape Heath called metulœflora bicolor, Pleroma elegans, a noble bush with deep violet blossoms larger than half-crown pieces; and Pimelea decussata. These as well as Mr. Frost's plants were all remarkably fine specimens. Mr. Morris, gr. to Coles Child, Esq., had a large and fine Stephanotis, an Everlasting, Pimelea and Vincas. Mr. Roser, gr. to J. Bradbury, Esq., sent Erica Massoni, a beautiful plant; Clerodendron Kæmpferi, and Mitraria coccinea.

ORCHIDS, as has been stated, were not so good as we have seen them even in July. Of collections of 24 plants, considerably the best came from Mr. Mylam, gr. to G. Reed, Esq. It contained Dendrobium Dalhousieanum and formosum, Aerides affine, a noble mass; Epidendrum cinnabarinum and vitellinum, Vanda Batemanni, with three flower spikes; Sobralia macrantha, Oncidium ampliatum, Odontoglossum hastilabium, Phalænopsis grandiflora, Calanthe masuca, Cypripedium Lowi, with two spikes each having three flowers on it; Vanda suavis, Cattleya Mossiæ and superba, Saccolabium guttatum, Stanhopea Lindleyana and tigrina, and Barkeria spectabilis, the last not the half-starved thing it usually is, but with most luxuriant foliage and loaded with flowers.

Mr. Williams, gr. to C. B. Warner, Esq., sent Miltonia spectabilis; an Anguloa, with creamy white blossoms; Barkeria spectabilis, the still rare Aerides maculosum, Dendrobium formosum, Epidendrum macrochilum, Odontoglossum citrosmum, well flowered: Cattleya Mossiæ, Cypripedium barbatum, Sobralia macrantha, and the white Calanthe veratrifolia. Mr. Woolley produced Sarcopodium Lobbi, in the shape of a mass of yellowish buff, horned-looking flowers; Dendrobium clavatum, Aerides odoratum majus, a good specimen of Phaius albus, and Lælia cinnabarina.

The only collection of 16 ORCHIDS exhibited came from Messrs. Veitch. It consisted of a beautiful plant of Oncidium pulvinatum, Sobralia macrantha, with at least a dozen and a half of flowers on it; the green-tailed Dendrochilum filiforme; two fine varieties of the Bearded Lady's Slipper; and Aerides Lobbi, the last a beautiful species, with a large amount of colour in it.

Of groups of 12 ORCHIDS, the best came from Mr. Gedney, gr. to Mrs. Ellis, of Hoddesdon. It contained a magnificent specimen of Phalænopsis, a good Calanthe masuca, Epidendrum vitellinum, Dendrobium Dalhousieanum and Phaius albus. Mr. Clarke, of Hoddesdon, had a Phalænopsis in good condition, and a well-flowered Oncidium luridum.

Of groups of 6 ORCHIDS there were several. The best came from Mr. Green, gr. to Sir E. Antrobus, Bart. The most remarkable plant in it was a large Aerides, which was well flowered, and otherwise in good condition. Mr. Ivison, gr. to the Duke of Northumberland, at Syon, sent a beautiful variety of Cattleya Mossiæ, and a noble Aerides odoratum. Mr. Morris had some good Oncidiums and Epidendrums.

Of scarce ORCHIDS Mr. Woolley furnished Catasetum longifolium, Mr. Mylam a Huntleya; and we also noticed the same Dendrobium belonging to the secundum class, which was exhibited at the last Chiswick exhibition.

CAPE HEATHS were shown by the usual growers of them; they were plentiful and well varied, many of the autumn flowering kinds differing greatly from one another, not only in habit of plant, size, and shape of flower, but also in colour. They, therefore, received more than usual attention.

ROSES this time were all shown in a cut state. They were produced by the usual exhibitors, with the exception of the Messrs. Lane, who did not show; and, considering the hot weather we have had, they were in good condition.

Of novelty there was little. Messrs. Veitch again showed their fine hybrid Rhododendron Princess Royal, a new continental Achimenes, with lilac flowers, yellow in the eye and streaked with purple, named Ambrose Verschaffelt; also the shrubby Phlox, named Leptodactylon californicum. One or two other plants were also shown as new; but the above were the most remarkable.

Of single specimens, Messrs. Veitch exhibited a fine bush of Pleroma elegans, whose showy violet blossoms are more persistent than those of most Melastomads. The same firm likewise furnished Ixora Lobbi, a fine species, with handsome foliage and rich salmon-coloured flowers.

Of FERNS there was an interesting but not large display. The most important were three groups of Exotic species, contributed by Dr. Young, Messrs. Rollisson, and Mr. Gedney. The first named, which was the finest collection, contained the very rare Gymnogramma ramata, and very finely grown plants of the following: Asplenium Belangeri, Marattia cicutæfolia, Cheilanthes lendigera, Nephrolepis davallioides, Cibotium Schiediana, and Platycerium grande. In Messrs. Rollisson's group there were Drynaria coronans, Platycerium grande, Davallia tenuifolia, Asplenium Belangeri, and a very elegant Fern obtained from the Jardin des Plantes under the name of Cœnopteris fœniculacea. Mr. Gedney's group, though of commoner kinds, was composed of remarkably well grown plants, among which an Adiantum cuneatum, forming a mass more than 2 feet across, was conspicuous. Of British Ferns the only collection shown was sent by Dr. Young, and included Cystopteris montana, Lastræa glandulosa, and numerous interesting varieties, particularly of Scolopendrium vulgare, and Athyrium Filix-fœmina. Mr. Parker, of Hornsey, contributed a mixed group, in which were many rare and curious Ferns, both native and exotic, among which we observed an Asplenium allied to A. fontanum, which is reputed to be of British origin.

VARIEGATED PLANTS were shown by Messrs. Veitch and Henderson; Messrs. Rollisson also had a group; but being wrongly entered they were disqualified.

KALOSANTHS were furnished by Messrs. Fraser. They consisted of well bloomed plants of miniata, coccinea, and a handsome kind called Angelina.

TALL CACTI came from Mr. Green, who sent Epiphyllum speciosum and its handsome variety called elegans, Greeni, and Cereus speciosissimus. Messrs. Pamplin also produced a seedling with flat stems and flowers like those of C. speciosissimus, but smaller.

ACHIMENES were furnished by Mr. Wiggins, gr. to Mr. Beck and Mr. Woolley. Among the sorts were longiflora and its white variety, Tugwelliana, Margarettæ, and other well known kinds.

PINKS were good and numerous. There were five collections of 24 blooms each in the open class. The first prize was awarded to Mr. C. Turner, Slough, Duke of Devonshire, Optima, Climax, New Criterion, Richard Andrews, Mr. Hoyle, Lola Montes, Adonis, Rival, Arthur, Sarah, James Hogg, Field Marshal, Fanny, Lord C. Wellesley, Narborough Buck, Cardinal, John Stevens, Juliet, Mr. Hobbs, Mr. Weeden, Jupiter, Esther, and Beauty of Salt Hill. Mr. Baker, of Woolwich, was second with some nicely laced flowers, but they wanted the depth and freshness of lacing observable in the first collection. The varieties dissimilar to those in the first lot were Sir J. Paxton, Criterion, Great Britain, Mrs. Norman, Favourite, Hercules, Brunette, Mrs. Wolf, President, and Purple Perfection. Mr. Bragg, Slough, who was third, had fine blossoms of Hercules, Purple Perfection, Cardinal, James Hogg, Jupiter, and Sarah. Mr. Parker, of Dalston, and Mr. Batten, of Clapton, also exhibited in this class. In the Amateurs' Class of 12 blooms Mr. Baker was first with 12 finely grown and well laced flowers, namely, Lord C. Wellesley, Brunette, Mrs. Wolf, New Criterion, Richard Andrews, Mr. Hobbs, Elizabeth Gair, Criterion, Duke of Devonshire, Narboro' Buck, Mrs. Norman, and Great Britain. Mr. Laurence, Hampton, was second, with Lord C. Wellesley, New Criterion, Sarah, Cardinal, Mrs. Maclean, Hector, Hercules, Arthur, Koh-i-Noor, Purple Perfection, Criterion, Climax. Mr. Blakesley, of Hampton, was third. Mr. Norman, of Woolwich, received a Certificate for 12 blooms of his seedling Mrs. Norman. This is a fine flower, with large broad petals, and very evenly laced. The same award was made to Mr. Turner, for Star; and to Mr. Bragg, for Annie Laurie and Ralph Bailey—three pretty flowers, but undersized as exhibited.

PANSIES were shown by Mr. Turner, Mr. Bryan, of Hounslow; Messrs. Dobson & Son, and Mr. Batten; also by Mr. Holder, in the class for private growers; these, though past their best, yet appear to have many admirers.

There was one collection of RANUNCULUSES from Mr. Parker, Dalston, large blooms, but not in sufficient variety.

PELARGONIUMS were present in larger numbers and in better condition than we often see them in July, but as we have so often given the names of the winning flowers in detail, we shall confine ourselves on this occasion to enumerating the remarkable specimens only. In 12 plants, Mr. Turner was first. His plant of Wonderful was very fine; nearly as good were Governor-General, Empress, Fair Ellen, Sanspareil, and Rena, the latter a good white. Messrs. Fraser had an evenly-grown lot of plants, in excellent health, the best of which was Sanspareil, Lucy, and Enchantress. Mr. Gaines and Messrs. Dobson and Sons came next. The class for six plants, new varieties, brought five competitors. Mr. Turner had Sanspareil, Wonderful, Virginia, Snowflake, Governor-General, and Phaeton. Mr. Beck, of Isleworth, had six small but pretty plants; they were Lucy, Governor-General, Laura, Conqueror, Fidelia, and Gem of the West. Mr. Holder, Messrs. Dobson and Sons, Mr. Gaines, and Mr. Robinson, also exhibited in this class. The Class for three plants did not produce much competition; this was for size without reference to quality. Mr. Turner was 1st with Vesper, Tiger, and Topey; Mr. Holder, gr. to the Rev. E. Coleridge, Eton College, 2d with Star, Narcissus, and Portia; Mr. Windsor was 3d. In the Class of 10 plants for private growers, Mr. Nye, gr. to E. Foster, Esq., Clewer Manor, was 1st, with flowers of excellent quality—Saracen, a bright scarlet, was very fine. Seraskier, Phaeton, Fair Ellen, Carlos, and Eva, were also very good. Mr. Holder was 2d, Mr. Robinson 3d, Mr. Beck 4th, Mr. Weir 5th, and Mr. Maher, gr. to J. Strachan, Esq., Teddington, 6th.

FANCY PELARGONIUMS.—These were as attractive as ever. In the Nurserymen's Class, Mr. Turner, Messrs. Fraser, Mr. Gaines, and Messrs. Dobson & Sons divided the honours. Private growers, Mr. Windsor, Mr. Weir, and Mr. Maher were the successful exhibitors, in the order they are given in. Fuchsias were produced fine by Mr. Bray, gr. to Baron Goldsmid, Regent's Park, Mr. Gaines, and Mr. Bishop. In these collections we did not observe anything new. Calceolarias were but indifferent, with the exception of six shrubby varieties, all Seedlings, raised and exhibited by Mr. Cole, St. Alban's. These are kinds suitable for bedding; Messrs. Henderson, Pine-apple Place, and Mr. James, gr. to —— Watson, Esq., Isleworth, were also successful exhibitors.

There were but few new bedding plants. A Bronze Medal was awarded to Mr. C. Turner, for a collection of new shrubby Calceolarias. There were 18 varieties of excellent habit; these were raised by Mr. Cole, St. Albans. Mr. G. Smith received a certificate for a seedling Petunia, Hermione, a new and pleasing kind, white, curiously spotted; it is a large flower. Mr. Nye received the Medal offered for the best Scarlet Pelargonium, with a free flowering bright variety named Amazon, with dark top petals. Mr. Nye also received a Certificate for Prince of Wales. This is a fine large bold flower for exhibition, rich dark top petals, lower petals bright cherry rose, clear white centre. G. W. Hoyle, Esq., Reading, received a similar award for Clotilde, a large free flowering kind, and Improved Majestic, with clear white centre. In Seedling Fancy kinds there were but two shown, Vivid and Prima Donna. The latter received a Certificate, and is a very good shaped new variety. Mr. Smith received a Certificate for a pleasing light Verbena, Sir C. Campbell, a flower of good form.

FRUIT was plentiful; but a good deal of it was far from being perfect. White Grapes were unripe, most of the Muscats being actually quite green, and Black Hamburghs ith some excellent exceptions were red. Peaches and Nectarines were generally good, and of Pine Apples there were 64; one or two of them, however, were very unripe, and many of them were small.

Collections of FRUIT came from Mr. McEwen, gr. to the Duke of Norfolk, Mr. Fleming, gr. to the Duke of Sutherland, Mr. Watson, Mr. Constantine, and Mr. Cowan. Mr. McEwen had three Melons, six dishes of Strawberries, one dish of Fastolf Raspberry, four dishes of Gooseberries, French Crab Apple still sound, White Dutch Currant, ripe Jargonelle Pears, six dishes of Peaches and Nectarines, Muscat and Black Prince Grapes (the former poor bunches, but ripe), Figs, excellent Greengage Plums, and Black Tartarian Cherries. Mr. Fleming produced beautiful bunches of Black Hamburgh Grapes, Royal George and Magdalen Peaches, Elruge and Violet Hative Nectarines, Hybrid Cashmere and Trentham Hybrid Melons, red Antwerp Raspberries, black Ischia Figs, and very good May Duke Cherries. Mr. Watson sent Figs, Peaches, Strawberries, Cherries, Pines, and Melons. Mr. Constantine had Black Hamburgh Grapes, Strawberries, Brown Turkey Figs, small May Duke Cherries, Elruge Nectarines, and Royal George Peaches. Mr. Munro, gr. to Mrs. Oddie, also had a neatly arranged box of fruit.

Of PINE APPLES the best four fruit came from Mr. Fleming, and good specimens were also furnished by Mr. Barron, gr. to Mrs. Vivian, Mr. Beal, gr. to A. Smith, Esq., and Mr. Spencer, gr. to the Marquis of Lansdowne. Of Providences Mr. Jackson, gr. to Lord Scarsdale, sent the best specimen, and an excellent fruit also came from Mr. Chapman, gr., Chilford, Cheshire. Of Queens Mr. Davis had the best; but excellent fruit were also contributed by Mr. Fleming, Mr. Peed, Mr. Spencer, and Mr. Turnbull, gr. to the Duke of Marlborough. Mr. Busby, gr. to S. Crawley, Esq., had an excellent smooth-leaved Cayenne.

Of GRAPES the best 12 lb. boxes were furnished by Mr. Henderson, gr. to Sir G. Beaumont, Bart., and Mr. Harrison, of Oatlands. These were good bunches and quite black; but most of the other 12 lbs. were red. In the class of three dishes Mr. Tillyard, gr. to the Speaker, had the best fruit, which was, however, closely followed by the contributions from Mr. Henderson and Mr. Martin, gr. to Sir H. Fleetwood, Bart. Of Black Hamburgh most excellent bunches came from Mr. Henderson, Mr. Fleming, and Mr. Boyd; and the best specimens of Black Prince were furnished by Messrs. Martin, Hill, and Turner. Of White Muscadines capital fruit came from Mr. Smith, gr. to S. Ricardo, Esq.; Mr. Tillyard; and Mr. Williams, gr. to C. B. Warner, Esq. Muscats, glorious bunches, with berries nearly as large as Greengage Plums, came from Mr. Strachan, gr. to R. B. Hill, Esq., but they were unfortunately little more than half ripe. Mr. Clarke, Mr. Turnbull, Mr. Taylor, Mr. Frost, and Mr. Allport also showed good examples of this variety of Grape. Very fine Frontignans came from Mr. Tillyard and Mr. Marchand. The best pot Vines came from Mr. Forsyth, gr. to Baron Rothschild, at Gunnersbury.

Of PEACHES decidedly the best were furnished by Mr. Snow, gr. to Earl de Grey. These consisted of Violet Hative and Noblesse. Mr. Collison had also large and fine Peaches; but they were over ripe, and bruised to pieces. Mr. Forbes, gr. to the Duke of Bedford, Mr. Constantine, and Mr. Gardiner, also sent good Peaches and Nectarines; Mr. Snow, Mr. Davis, and Mr. Ruffet had, however, the best fruit, but good specimens also came from Mr. Turnbull, Mr. Frost, and Mr. Munro, gr. to Mrs. Oddie.

Of MELONS, the best (a green-flesh sort), came from Mr. Spencer; but Mr. Tegg, Mr. M'Ewen, and Mr. Fleming were also successful exhibitors of this fruit. Of scarlet-fleshed kinds Mr. Marchand, gr. to J. Smith, Esq., had the best. Mr. M'Ewen also showed fruit of this class.

FIGS were furnished by Mr. Ivison, gr. to the Duke of Northumberland; Mr. Snow, and Mr. Constantine. The sorts were Black Ischia and Brown Turkey.

CHERRIES, large and fine, came from Mr. Taylor, gr. to J. Coster, Esq., and Mr. Snow, gr. to Earl de Grey.

The best STRAWBERRIES were shown by Mr. Smith, of Twickenham, but Mr. Tillyard and Mr. Lidyard also produced good dishes. The sorts were British Queen and Keens' Seedling.

TROPICAL FRUITS were contributed by Mr. Ivison, gr. to the Duke of Northumberland, at Syon. They consisted of Momordica balsamina, Vanilla, Plantain fruit, and Nutmegs.

Notices of Books.

Traité général des Conifères, ou description de toutes les espèces et variétés aujourdhui connues, avec leur synonymie, l'indication des procédés de culture et de multiplication qu'il convient de leur appliquer. By Elie-Abel Carrière, superintendent of the Nurseries of the Museum of Natural History, Paris. 8vo, pp. 655 Barthes & Lowell, London.

A GOOD book on Coniferous plants is much needed, for the purpose of fixing their nomenclature, settling their synonymy, and describing their peculiarities, natural localities, and œconomical value. But who is to write it? who to disentangle the perplexed names, to settle the limits of species, and to reduce to order the heap of raw materials now collected by travellers, gardeners, botanophilists, and botanists? That would be no easy task nor one to be lightly undertaken, for there is difficulty at every step, and the danger of error is such as to render considerable accuracy all but hopeless.

In the mean while the work before us will be thought extremely useful. Founded upon the well-known work of Endlicher, but stripped of its Latin, dressed in French, largely augmented by references to recent species, and enriched with numerous details of horticultural and œconomical value, it must be regarded as a first-class gardeners' volume, in which as much exactness is found as can perhaps be attained as matters at present stand. We bear witness, with great pleasure, to the care which M. Carrière has shown in collecting the species missed by Endlicher or published since his time; and also to the value of his very complete Index. If we cannot always agree with him in his determination of synonyms, nor in his ideas of species and genera, we can at least admit that differences of opinion upon such points are perhaps inseparable from the subject.

That which strikes us as the most objectionable is the want of any apparent principle in the formation of genera, and this is the more unfortunate because it strikes at the very foundation of a settled nomenclature. Linnæus threw into one genus (*Pinus*) all Pines, Firs, Larches, and Cedars. Others formed two genera, *Pinus* for the trees having from two to five leaves surrounded at the base by a common sheath, and hard woody cones with scales pyramidal at the point; *Abies* for the trees having scattered leaves, with thinner cone-scales not pyramidal at the point. This was an intelligible useful distinction and has been very generally recognised. But to construct out of Abies such genera as *Tsuga*, *Abies*, *Picea*, *Larix*, and *Cedrus* seems to us wholly undesirable and attended with no advantage, to say nothing of the impossibility of defining the limits within which such names are to be applied. Where, for example, can *Abies Kampferi* be placed in this sort of arrangement? Since it will come within the definition of none of them, we presume that some one will elevate it to the dignity of a separate genus.

In the cases above quoted M. Carrière runs into the extreme of multiplying genera. In the case of *Wellingtonia* he takes the opposite course, and led by authority he merges that plant in *Sequoia*. But if he were true to himself he would have resolutely maintained it, for its claim to separation is at all events as great as that of such genera as Picea, Tsuga, Larix, Biota, Libocedrus, &c., which our author accepts without hesitation. And we will here remark that neither the arguments nor the figures produced in the *Revue Horticole* by our learned friend Decaisne, to show that *Wellingtonia* is only a *Sequoia*, carry any conviction to our mind; as we shall explain whenever a fitting occasion shall arise.

Passing from the question of genera let us next advert to species. For the sake of showing the difficulties that beset the inquirer in this department of the subject, we select the Tree Juniper, to which we have lately referred, as forming a conspicuous part of the vegetation of Balaklava. What is that plant? No one can doubt that it is what Bieberstein intended by his *Juniperus excelsa*, as the locality he gives (Tauria meridionalis) plainly shows; which is confirmed by Trautvetter. But M. Carrière substitutes the name *fœtidissima* for *excelsa*, although the latter is more fragrant than the contrary, upon the supposition that the plant in question is a certain Savin, as tall as a Poplar, found by Tournefort between Tiflis and Erivan, and by him called "Cedrus orientalis fœtidissima." But the Crimean plant does not at all agree with the description of the great French botanist, who says, among other things, that his Savin had green berries, and leaves yellowish but glaucous on the under side, while the berries of J. excelsa are jet black, and the leaves not at all glaucous. It is, therefore, by no means certain that *J. excelsa* and *fœtidissima* are the same plant. Moreover, Kotschy thinks he has found the latter, as well as *excelsa*, on the Bulgar Dagh of Cilicia, and, if he is right, even the Turks distinguish the two, calling the first "Bosch Ardytsch," and the latter "Selwi or Jach Ardytsch." The two plants, which are now before us, undoubtedly appear to be very distinct: and upon comparing the wood of the Balaklava Juniper (for specimens of which we are indebted to our gallant friend Colonel Munro, of the 39th) with that of what M. Kotschy believes to be *J. fœtidissima*, the distinction is even greater, the grain of the two being altogether different. But while M. Carrière thus substitutes the name *fœtidissima* for *excelsa* without, as we presume to think, sufficient authority, he applies the latter name to another Juniper which he

says grows wild in the Himalayah, the Crimea, Syria, Asia Minor, Arabia, and the island of Tassos, where, mixed with Pinus Laricio, it forms forests. He is not, however, sure about the latter localities, but concerning the Himalayah he entertains no doubt. Nevertheless this Himalayan Juniper is a plant of which little is known with certainty in Europe. What Dr. Wallich distributed under this name has nothing to do with either the Crimean or Cilician plant, and the western Indian tree, be it what it may, requires re-examination. It is, therefore, unfortunate that the name by which the Crimean plant is known should have been disturbed, at least until far more precise knowledge shall have been gained concerning the allied species than we at present possess.

If the reader takes this as a sample of the perplexity which surrounds a single Juniper, he may form an opinion for himself of what is the condition of many other Conifers, and of the serious difficulty that occurs as soon as any critical inquiry is commenced.

M. Carrière's very useful volume is terminated by 65 pages on the cultivation and propagation of Conifers, a part of the subject to which we must advert on another occasion.

Miscellaneous.

The Winter in the United States.—Rochester, New York, March, 1855.—The winter through which we have just passed will not soon be forgotten. In many of the southern and western states there has been a severe drouth in the depth of winter—rivers, streams, and springs so low that water for ordinary purposes could scarcely be had. We have heard of cattle dying for want of it. Until mid-winter the western rivers were too low for navigation; then came the wonderful snow storms of February, covering up entire trains of railway carriages on the western prairies, and blocking up railway travel in nearly all parts of the country; close upon this came the intense cold of the 6th and 7th of February, when the mercury sunk 26° below zero in the usually mild lake countries and Western New York, where 0° is reckoned very cold, and is seldom experienced. We have strong fears that the fruit crop of 1855 will be very small. Here our Peaches are gone; not only are the fruit-buds killed, but we fear the trees themselves are frozen to death down to the very roots. In cutting through the bark, we find the wood quite discoloured, and to all appearance completely disorganised. *Horticulturist.*

Hollyhock Paper and Rope.—Mr. Niven, gardener, Keir House, has suceeded in fabricating paper and rope from the common garden Hollyhock, and has patented his invention. The paper is of the appearance and texture of that used for small bags and parcels by grocers, &c., and is very clean and firm. The rope is about half an inch thick, light and shining in colour, and apparently of considerable strength. *Perth Courier.*

Calendar of Operations.

(For the ensuing week.)

PLANT DEPARTMENT.

CONSERVATORY, &c.—The beauty of most soft wooded plants will be considerably prolonged by a liberal supply of manure water, which will also greatly assist in preserving the healthy vigorous appearance of the foliage; therefore, wherever it can be done without annoyance to the family, this should be used regularly for such things as Clerodendrons, Allamandas, &c., giving it in a clear state and regulating the strength according to the nature of the plant. And Orange trees, Camellias, and many other hard wooded plants will be grateful for the same treatment; indeed Orange trees, after they are kept rather short of pot room, should never be watered but with strong clear manure-water. Use every means to keep the atmosphere moist on bright days, and spare no trouble to keep the stock clear of insects, removing and smoking any pot specimen that is found to be infested with green-fly, and dipping in tobacco-water the affected parts of those which cannot be removed. Shading will of course be indispensable on bright days, but do not use this save when it cannot be safely dispensed with, for Conservatories are generally rather lofty, and the roofs partially shaded by twiners and plants, in such houses, are soon injured by a too free use of shading. Attend frequently to the twiners, keeping the growth nicely regulated; also be careful to properly supply the beds and borders with water, and make sure by frequently examining the soil that this is being done; for plants, if allowed to suffer for want of water at the root at this season, are sure to become a harbour for red spider and other pests. COLD PITS.—The stock here will now be growing freely, and should be frequently examined individually, to see that all is going right; for plants, when growing rapidly, very speedily suffer through any neglect in watering, or from the attacks of insects. Examine young specimens that were potted early in the season, and shift at once such as require more pot room, so as to get the pots moderately well filled with roots before winter, in which state they are much more easily carried over the winter than when either over or under potted. Leschenaultias should be carefully examined for green-fly, and smoked at once if at all infested, and the flowers should be regularly picked off young plants of these as they appear. Chorozemas, Bossiæas, &c., must also be frequently examined for red spider, and should be laid upon their sides on a clean mat and thoroughly washed with the syringe, repeating this as often as may be necessary to thoroughly eradicate the pest. Young specimens of valuable hard-wooded plants should be carefully trained, keeping the shoots nicely tied out or pegged down in order to secure close compact foundations, upon which future success very largely depends. STOVE.—Look well to young stock, and see that everything is in a favourable state for making vigorous growth, repotting at once such as require more pot room, and giving a liberal supply of water at the root, for the season will soon be less favourable for securing rapid strong growth. Give every necessary attention to the eradication of all kinds of insects. Use fire heat sparingly, and save on damp cloudy days and unseasonably cold nights, or where it is wanted for supplying bottom heat, it may safely enough be altogether dispensed with for a few weeks. Shut up early in the afternoon however, sprinkling floors, walls, and every available surface, and dewing the plants lightly; but be careful not to syringe over head plants that are in bloom, otherwise their beauty will be but short-lived, particularly where fires are not used at night.

FORCING DEPARTMENT.

PINERIES.—So far this season has not been particularly favourable for securing well ripened high flavoured fruit, and such varieties as are at all liable to spoil at the bottom before the upper pips are coloured should be kept as dry as possible immediately they show the least signs of colouring, keeping the atmosphere also as dry as can be done without serious injury to the rest of the stock. VINERIES.—Grapes intended to hang through the winter should be thinned very freely, and, if necessary, these should be gone over a second time, leaving them, so that the berries, when fully swelled, will scarcely touch each other. And only a moderate crop should be left on the Vines; for, to ensure success in keeping Grapes fresh and in good condition till next March, the Vines must be in first-rate health; therefore be satisfied with a moderate, or rather light crop, in the late house. Keep the atmosphere of houses where the fruit is colouring in active circulation, using gentle fires by day, with abundance of air, and leaving a little air on at night, to prevent damp. If red spider appears inclined to be troublesome, wash the pipes, &c., with a mixture of soot and lime, and if the colour is objectionable, add more soot. FIGS.—Trees that have been kept dry while ripening the first crop, and are now cleared of this, should be well watered at the root, and if there is any appearance of red spider, the leaves should be thoroughly washed with the engine. Give manure-water to trees showing a heavy second crop, and keep the atmosphere moist by frequently sprinkling the passages and borders, &c. Keep the shoots thin and regularly tied in, so as to avoid confusion, and expose all parts of the tree equally to the light. Where the fruit is ripening attend to previous directions, and keep the atmosphere and borders as dry as can conveniently be done. Assist trees in pots by giving them a liberal supply of manure water.

FLOWER GARDEN AND SHRUBBERIES.

Go over the beds frequently, keeping the young shoots of Verbenas, &c., nicely regulated and pegged down until the beds are fairly covered, after which, unless where the soil is very strong, or where it may be desirable to keep the masses as low as possible, the shoots of most varieties may be allowed to grow at liberty. Where the soil is of a rather poor nature, and the progress of the plants not satisfactory, a few waterings with manure water would be useful in the way of inducing more rapid growth; but this should not be given too strong nor too freely, otherwise it may do more harm than good, and in most cases such things make more wood than is desirable, nevertheless we have found manure water judiciously applied useful in giving backward plants a start. Keep the surface soil free, open, and clear of weeds by occasional stirrings, and should the weather be such as to render watering necessary, do not let the plants feel the want of moisture at the root. See that Dahlias and Hollyhocks are tied as they advance in growth, and keep these thoroughly supplied with water at the root, giving manure-water where the ground was not well prepared. Look over Roses and dip any shoots found to be infested with green-fly in tobacco-water. Also keep these well supplied with water at the root, which will greatly improve the flowers, as well as prolong the beauty of the plants, for the flowers soon fade in bright hot weather when the plants are allowed to get dry at the root. Too much manure-water can hardly be given these, especially the autumn-blooming sorts, and nothing better repays any attention which they may require, for if kept in vigorous health many of the sorts will bloom almost continually until stopped by frost, but if allowed to suffer through dryness at the root they will bloom but sparingly in autumn. Watch varieties subject to mildew, and apply sulphur immediately the enemy is perceived, but if the plants are kept in vigour by a liberal allowance of manure water there is little danger of mildew being troublesome.

HARDY FRUIT AND KITCHEN GARDEN.

Get Brussels Sprouts, Savoys, Broccoli, and all kinds of winter greens planted out as speedily as ground can be obtained; and where this cannot be done at present to the usual extent (owing to the backwardness of the season, and early crops not being ready for clearing off), see that the plants are either pricked out, or sufficiently thinned to allow of their growing dwarf and strong; and if a goodly portion of old Mushroom-bed dung were mixed with the soil before pricking out, the roots would run into this, so that the plants might be removed with balls, and would hardly feel the shift. Also get Leeks planted on strong, deep, heavily manured land, and attend to these and all other newly planted things with water until they get fairly established. Give the Asparagus plenty of manure water from the stable or farm-yard tank, in order to strengthen the roots after cutting and induce strong growth. On dry friable soils a good dressing of salt may be applied with advantage; but this should not be given on strong tenacious soils, as it keeps the ground wet and heavy in winter and decays the roots. Proceed with the planting out of Celery as fast as ground can be spared, and see that the whole is liberally supplied with water. Some persons defer the soiling up of Celery as long as it can be done, considering that there is less danger of its being eaten by slugs; but if these pests are at all troublesome, they should be treated to a dose of quick lime every morning for a week or so, strewing it thickly along the trenches and about the plants, which will clear the ground of them, and then there will be no danger in adding a little soil occasionally to assist in retaining the moisture, and afford more space for the roots. Attend to the staking of late Peas, and keep the ground thoroughly moist about advancing crops, and if the weather continues hot and dry, it will be advisable to mulch the ground along the sides of the lines, first giving the soil a thorough soaking of water. See to keeping up a succession of French Beans, also Salad of all kinds, making a sowing of Parsley for winter use.

STATE OF THE WEATHER AT CHISWICK, NEAR LONDON,
For the week ending July 5, 1855, as observed at the Horticultural Gardens.

June and July.	Moon's Age.	Barometer. Max.	Barometer. Min.	Temperature of the Air. Max.	Temperature of the Air. Min.	Temperature of the Air. Mean	Temperature of the Earth. 1 foot deep.	Temperature of the Earth. 2 feet deep.	Wind	[illegible]

Satur. 14	75.5	52.0	63.8	12	0.64	[illegible]	[illegible]

The highest temperature during the above period occurred on the 16th 1847—therm. 93½ deg.; and the lowest on the 10th, 1851—therm. 38 deg.

Notices to Correspondents.

HEATING: *Clericus.* The water should not be withdrawn from the pipes in your greenhouse.‡

INSECTS: *T H B, (Londonderry).* Your Onions are badly infested with the grubs of the Onion-fly (Anthomyia Ceparum), the history and figures of which are given in *Gard. Chron.*, 1841, p. 396. As the flies go through their transformations very quickly at this period of the year it is absolutely necessary that every diseased Onion should be at once drawn out of the bed and smashed under foot.—*D B.* Your Elm leaf-galls are the production of one of the aphides (Tetraneura Ulmi). Each colony is the production of a single female, which deposits her eggs in the leaf and thus causes the gall to be produced. *W.*

LUNGWORT: *W.* This plant, Pulmonaria officinalis, is held to be absolutely inert, like Borage. Its name is admitted to have been given from its spotted leaves being supposed to resemble the air cells of the lungs. You can only find it in old cottage gardens, botanic gardens, or nurseries where hardy herbaceous plants are cultivated.

NAMES OF PLANTS: We have been so often obliged to reluctantly decline naming heaps of dried or other plants, that we venture to request our correspondents to recollect that we never have, or could have undertaken an unlimited duty of this kind. Young gardeners, to whom these remarks more especially apply, should bear in mind that, before applying to us for assistance, they should exhaust their other means of gaining information. We cannot save them the trouble of examining and thinking for themselves; nor would it be desirable if we could. All we can do is to *help* them—and that most willingly. It is now requested that, in future, not more than four plants may be sent us at one time.—*Erzeroum.* 1143, Astragalus adnatus; 1371, Portulaca oleracea; 1376, Ceratocarpus; 1351, Chenopodium; 1334, Corydalis Marshalliana; 1347, Delphinium consolida; 1346, Lythrum thymifolium; 294, Cnicus Benedictus; 1367, Puschkinia scilloides; 1365, Eremurus spectabilis; 1358, Iris iberica; 1291, Fritillaria tulipifolia, var.?—*J S.* Acer Negundo. The cause of the disease in the Cauliflower cannot be investigated without knowing what the insect is. Perhaps rank manure is the cause.—*Jane S P.* The species of Myosotis, as they are called, are very difficult of determination. Your specimen is ruined in the post-office; it looks like a great white variety of M. versicolor. If you will send a specimen neatly pressed upon card-board, and with ripe fruit, we will give you a positive reply.—*H B.* We suppose Pinguicula lusitanica; it is stamped to pieces.—*A B.* 1. Arthropodium cirratum; 2. Nierembergia filicaulis.—*Somerset.* Doubtless it is a Philadelphus of some sort, and we do not see how it differs from the common P. coronarius.—*Essex.* It seems to be some Asperula; but until it flowers it cannot be identified with certainty. It is probable that the dry season which has injured the Grass has enabled the new plant to show itself instead of being smothered as heretofore among other herbage.

PRESERVING FRUIT: *Sub.* The recipe you seek for is, we presume, Mr. Lovejoy's, which is as follows: "Pick the fruit from the stalks; put them into the bottles. Put one drachm of alum into four gallons of boiling water; let it stand till it is cold; then fill the bottles; bung them tight; then put them into a copper of cold water, and heat it to 176°. Then tie them over with bladder and seal them."‡

MISC: *R P.* You can have Nos. 37, 1852; 18 and 20, 1853; the others are out of print.

*** As usual, many communications have been received too late, and others are unavoidably detained till the necessary inquiries can be made. We must also beg the indulgence of those numerous correspondents, the insertion of whose interesting contributions is still delayed.

PERUVIAN GUANO, Bolivian Guano, Superphosphate of Lime, Nitrate of Soda, Sugar Scum, and every description of Artificial Manures, Linseed Cakes, &c.
WM. INGLIS CARNE, 10, Mark Lane, London.

PATENT SANITARY SEWAGE COMPANY'S NITRO-PHOSPHATED CARBON OR BLOOD MANURE, 8l. 10s. per ton; delivered in London, bags included. Each ton contains 1350 lbs. Blood and 11 per cent. of Phosphate of Lime.—Agents throughout the country.—22, Lincoln's Inn Fields, London.

TURNIP SOWING, ETC.

GENUINE HALF-INCH BONES AND BONE-DUST may be had in any quantity of JARED TERRETT HUNT, Lambeth Wharf, Upper Fore Street, Lambeth, near Vauxhall Bridge. Also Superphosphate of Lime and Sulphuric Acid for dissolving Bones. J. T. H. also invites the attention of Gentlemen and Agriculturists in general to his Superior Fine Bone-Dust for dressing Lawns, Parks, &c. Delivered to any Railway in London in Sacks.

PATENT WOOL MANURE, 8l. 8s. per ton.—Application for Agencies, from persons of influence and respectability, will be received until the 31st inst.
NOTTIDGE & Co., 81, Gracechurch Street, London.

CORN MANURE FOR SPRING SOWING.
CONCENTRATED URATE FOR GRASS, RAPE, AND ALL ROOT CROPS.
SUPERPHOSPHATE OF LIME.

THE LONDON MANURE COMPANY continue to manufacture the above Manures, which have been used with so much success for the last 14 years.

The London Manure Company also supply PERUVIAN GUANO (direct from importers' warehouses), Nitrate of Soda, Sulphate of Ammonia, Fishery and other Salts, Bone Dust, and every artificial manure of known value. EDWARD PURSER, Sec.
Office—40, Bridge Street, Blackfriars.

THE FOLLOWING MANURES are manufactured at Mr. LAWES' Factory, Deptford Creek:—Turnip Manure, 7l. per ton; Superphosphate of Lime, 7l.; Sulphuric Acid and Coprolites, 6l.
Office, 69, King William Street, City, London.
N.B. Genuine Peruvian Guano, guaranteed to contain 16 per cent. of ammonia. Nitrate of Soda, Sulphate of Ammonia, and other Chemical Manures.

MANURES.—The following Manures are manufactured by HODGSON & SIMPSON, Calder Soap Works, Wakefield, and MATTHEWS & Co., Manufacturing Agricultural Chemists, Driffield. SIMPSON'S AMMONIA PHOSPHATE, a valuable Top-Dressing for Wheat, Barley, and Oats. SIMPSON'S NITRO-PHOSPHATE for Turnips, Potatoes, and all other bulbous root crops, price 8l. per ton. N.B. Manures specially prepared for Grass and Flax. The above have been successfully tested for the last Seven Years by the leading farmers in Yorkshire and Lincolnshire, and other counties, and were applied last season to a breadth of upwards of 15,000 acres of land with the most beneficial results to the crops. A List of Testimonials and other particulars will be forwarded by post on application.

ARTIFICIAL MANURES, &c.—Manufacturers and others engaged in making ARTIFICIAL MANURES may obtain every necessary instruction for their economical and efficient preparation, by applying to J. C. NESBIT, F.G.S., &c., Principal of the Agricultural and Chemical College, Kennington, London. Analyses of Soils, Guanos, Superphosphates of Lime, Coprolites, &c., and Assays of Gold, Silver, and other Minerals, are executed with accuracy and dispatch. Gentlemen desirous of receiving instructions in Chemical Analyses and Assaying, will find ample facility and accommodation at the College.

COLLEGE OF AGRICULTURE AND CHEMISTRY, AND OF PRACTICAL and GENERAL SCIENCE, 37 and 38, Lower Kennington Lane, Kennington, near London.
Principal—J. C. NESBIT, F.G.S., F.C.S., &c.
The system of studies pursued in the College comprises every branch requisite to prepare youth for the pursuits of Agriculture, Engineering, Mining, Manufactures, and the Arts; for the Naval and Military Services, and for the Universities.
Analyses and Assays of every description are promptly and accurately executed at the College. The terms and other particulars may be had on application to the Principal.

THE GENERAL LAND DRAINAGE AND IMPROVEMENT COMPANY
INCORPORATED BY SPECIAL ACT OF PARLIAMENT.
Offices, 52, Parliament Street, London.
DIRECTORS.
HENRY KER SEYMER, Esq., M.P., *Chairman.*
SIR JOHN V. SHELLEY, Bart., M.P., *Deputy-Chairman.*
George Thomas Clark, Esq.
John C. Cobbold, Esq., M.P.
Sir William Cubitt, F.R.S.
Henry Currie, Esq.
Thomas Edward Dicey, Esq.
William Fisher Hobbs, Esq.
Edward J. Hutchins, Esq., M.P.
Sir S. M. Peto, Bart.
William Tite, Esq., F.R.S.
William Wilshere, Esq.
Empowered to execute Drainage, Road-making, and other Land Improvements, and to Erect Farm Buildings upon Estates under Settlement, Mortgage, or otherwise; or Church property, and without investigation of Title to charge the whole outlay and expenses upon the Estate, to be repaid by instalments spread over any period determined by Landowners within the limits of 50 years for Drainage and Roads, and 31 years for Farm Buildings.
Landowners may arrange with the Company for the execution of the works by their own agents, with the use of their own or the Company's Capital. WILLIAM CLIFFORD, Sec.

THE LANDS IMPROVEMENT COMPANY.—Incorporated by Act of Parliament, 1852—53, for England and Scotland, and further empowered by Amendment Act, 1854—55. To Landowners, the Clergy, Solicitors, Estate Agents, Surveyors, &c., Tenants for Life, Trustees, Owners in Fee, Incumbents of Livings, Bodies Corporate; Lessees for Lives renewable, or for a term of more than 25 years; (and Lessees for Lives not renewable, or for a term less than 25 years, with consent of their Lessor), &c., are enabled, by way of Loan from the Company, or by their own funds, to execute and charge on the Lands improved, by way of rent-charge for a term of 25 years, repaying capital and interest, the cost of every landed improvement, especially of Drainage, Irrigation, Warping, Embanking from the Sea, from Lakes, Rivers, or Streams, Inclosing any Land, or improving Drains, Streams, or Water-courses, Reclamation, Farm Roads, Clearing, Erection of Farm-houses and other Buildings required for farm purposes, and the Improvement of and Additions to Farm Houses, and other Buildings for Farm purposes already erected; Planting for Shelter and for Periodical Cuttings, Jetties or Landing Places on the Sea Coast or on the banks of navigable Rivers or Lakes in the Highlands and Islands of Scotland; Engines and Machinery for Drainage, Engine-houses for Farm Steadings, &c., Water-wheels, Tanks, Pipes, Water-courses, Bridges, Sluices, &c. The Plans of Buildings, Specifications and estimates are prepared by the Applicant's own Agents and are submitted to the approval of the Inclosure Commissioners' Inspectors who are also the sole judges of the due execution of the works. Proprietors may apply jointly for the execution of Improvements mutually beneficial,—such as a common Outfall—Roads through the District—Water power, &c. The Directors wish it to be understood that the Company is of a strictly commercial character, and that the details of the Plans and of the execution of the Works are not interfered with by them, but are controlled by the Landowner and by the Inclosure Commissioners. For further information and for Forms of Application, apply to the Honourable WILLIAM NAPIER, Managing Director, 2, Old Palace Yard, Westminster.

ROYAL AGRICULTURAL COLLEGE, CIRENCESTER.
Patron—His Royal Highness Prince ALBERT.
President of Council—Earl BATHURST.
Principal—Rev. J. S. HAYGARTH, M.A.
Professors, &c.:—
Chemistry—J. A. C. VOELCKER, Ph.D., F.C.S.
Zoology, Geology, and Botany—JOHN BUCKMAN, F.G.S., F.L.S.
Veterinary Medicine and Surgery—G. T. BROWN, M.R.C.V.S.
Surveying, Civil Engineering, and Mathematics—F. ARMSTRONG, C.E.
Manager of Farm—G. AUSTIN.
The Second Session of 1855 begins in August. The annual fees for boarders vary from 45 to 80 guineas, according to age and other circumstances. The fee for out-students is 40l. per annum. The College course of lectures and practical instruction is complete in one twelvemonth, although a longer course is recommended. There is a department for general as well as for agricultural purposes. Prospectuses and information can be had on application to the Principal.

YORKSHIRE AGRICULTURAL SOCIETY, OPEN TO THE UNITED KINGDOM.—The EIGHTEENTH ANNUAL MEETING will be held at Malton, on the 1st and 2d of August. The Entry closes on July 18th.
Prize Sheets and Forms of Certificates may be had on application to the Secretary. JOHN HANNAN, Sec.
Kirk Deighton, Wetherly, July 7.

HAY-MAKING MACHINES.
THE ROYAL AGRICULTURAL SOCIETY'S PRIZE MACHINES are supplied by WM. DRAY & Co., Swan Lane, Upper Thames Street, London.

WARNER'S IMPROVED LIQUID MANURE, OR GENERAL PORTABLE PUMP.

The valve is a ball of imperishable material, and cannot clog in action. The barrel is of galvanised iron, not likely to corrode, and can be raised or lowered at pleasure. The legs will fold together, and the whole may be carried on shoulder to any pond or tank required.
Price of 4½ in. Pump, with legs, 3l. 3s. The barrel is 27½ in. long, and the legs are 5 ft. high.
1½ inch Gutta Percha Suction Pipe, 1s. 6d. per foot.
1½ inch Flexible Rubber and Canvas Suction Pipe, 3s. 6d. per foot.
May be obtained of any Ironmonger or Plumber in town or country, at the above prices, or of the Patentees and Manufacturers, JOHN WARNER & SONS, 8, Crescent, Jewin Street, London.
Every description of Machinery for Raising Water, by means of Wheels, Rams, Deep Well Pumps, &c.; also Fire and Garden Engines, &c.—Engravings sent on application.

WARNER'S PATENT VIBRATING STANDARD PUMPS.
PATENT CAST-IRON PUMPS, for the use of Farms, Cottages, Manure Tanks, and Wells of a depth not exceeding 30 feet.

Diameter of Barrel	Length of Barrel, under nose.		£ s. d.
2½ in. short	1 ft. 7 in.	Fitted for lead,	1 12 0
2½ „ long	3 „ 3 „	gutta percha,	1 15 0
3 „ ditto	3 „ 6 „	or cast iron	2 12 0
3½ „ ditto	3 „ 6 „	flanged pipe,	2 18 0
4 „ ditto	3 „ 6 „	as required.	3 5 0
2½ „ short, with 15 feet of Lead Pipe attached, and Bolts and Nuts ready for fixing			2 12 0
2½ in. long	ditto	ditto ditto	2 15 0

The short barrel Pump is very convenient for fixing in situations of limited height and space, for the supply of coppers and sinks in Wash-houses with soft water from underground tanks, or in Hot, Forcing, and Plant Houses; they may be fixed, when desired, under the stage.
May be obtained of any Ironmonger or Plumber in Town or Country, at the above prices, or of the Patentees and Manufacturers, JOHN WARNER AND SONS, 8, Crescent, Jewin Street, London.
Every description of Machinery for Raising Water, by means of Wheels, Rams, Deep Well Pumps, &c.; also Fire and Garden Engines, &c. &c.—Engravings sent on application.

JOHN WARNER AND SONS, Crescent, Jewin Street, London.
GALVANISED IRON TUB GARDEN ENGINE,
WITH WARNER'S REGISTERED SPREADER,

is strongly recommended, for durability and low price, viz., 2l. 19s., to hold 10 gallons.
Larger sizes in wood or iron, viz., 14 gals., 24 gals., & 35 gals. May be obtained of any Ironmonger or Plumber in town or country, or of the Patentees and Manufacturers, as also Machinery of all kinds for raising Water from any depth to any height by Steam, Horse, or Manual Power. Prices sent on application. Syringes of various constructions and sizes from 9s. upwards. Metallic String from 5d. to 1s. 3d. per lb.

CLAYTON, SHUTTLEWORTH, & CO.'S PRIZE PORTABLE STEAM ENGINES, AND COMBINED THRESHING, STRAW SHAKING, RIDDLING AND WINNOWING MACHINE may be seen at their London Establishment, 6, Fitzroy Terrace, New Road, where all information relative thereto can be obtained. These Machines are constructed to horn Barley, and make a perfect separation of the chaff from the pulse. They are fitted with Elevators, which deposit the grain into bags, and beyond the feeder of Machine require no hands except to take away the Corn, &c., as threshed, the whole of the operations being performed by self-acting machinery, whereby the Corn, Straw, Chaff, and Pulse are delivered in the places assigned for them.
C. S. & Co. have paid special attention to this class of Machinery, and Fixed Barn Machinery, and from the position they have taken at the Royal and all the leading Agricultural Shows of England, flatter themselves that for efficiency, durability, and simplicity, their Engines and Machines are not surpassed by any other maker in England. All letters forwarded to the Works at Lincoln will have immediate attention; and Illustrated Catalogues forwarded to all parts of the kingdom postage free.

CAUTION.
PARKES' STEEL DIGGING FORKS AND DRAINING TOOLS.
Whereas very inferior descriptions of Steel Digging Forks are now manufactured and sold, and I have been informed that purchasers of the same have believed them to be the same as those manufactured by me, and to which the Royal Agricultural Society and numerous Agricultural Societies' prizes have been awarded, I hereby respectfully inform the public that every Fork manufactured by me is stamped with my trade mark "J. P.," and that Messrs. BURGESS & KEY, of No. 103, Newgate Street, London, are my sole Wholesale Agents, and I have authorised them to replace to the purchaser every Fork of my manufacture found defective; they will also on application send Wholesale and Retail Price Lists, &c., post free. FRANCIS PARKES & Co.

IMPROVED MOWING AND ROLLING MACHINE.

ALEXANDER SHANKS AND SON, Arbroath, Forfarshire, Inventors and Sole Manufacturers, respectfully solicit the attention of the Nobility, Gentry, and Gardeners to this Improved Machine for Mowing and Rolling Lawns. The Machine is in operation in the Royal Gardens at Windsor Palace, Buckingham Palace, and at Osborne, in the Botanical Gardens at Kew, Regent's Park, Manchester, Sheffield, &c.; at Blenheim Palace, Trentham, Cleveden, Elvaston, Broadlands, Woburn Abbey, Clumber, Lilleshall, Castle Howard, Shrubland, Eridge Castle, Enville Hall, Tiptree Hall, Chatsworth, and in many other of the principal gardens in the kingdom as well as in the United States, British America, and on the Continent, where its merits have been fully proved, and its success established.
The machine is made to cut the breadth of 42, 30, 20, and 15 inches respectively, is exceedingly durable, easily managed, and adjusted to cut to the length required. The execution of the work is far superior to what may be attained by the most skilful mower, while at the same time a great saving of labour is effected, and the turf much improved. By the largest machine a Scotch acre may be mowed, rolled, and the Grass collected in one hour.
A. S. and SON have much pleasure in stating that they have made considerable improvements in their 15-inch or hand machine this year, by which the draught is considerably lessened. This machine combines all the merits and advantages of the larger machines with firm and secure construction, and is admirably adapted for borders and for lawns of no great extent.
ALEXANDER SHANKS and SON also respectfully solicit notice to "Fleming's Weeding or Salting Machine" for destroying weeds in gravel walks, court-yards, drives, &c. This machine is now in operation in many parts of England, where it has given ample satisfaction as the best and most economical means of thoroughly keeping down weeds or Moss.
Further particulars, with testimonials and prices, may be had on application.

The Agricultural Gazette.

SATURDAY, JULY 7, 1855.

MEETINGS FOR THE ENSUING WEEK.
WEDNESDAY, July 11—Agricultural Society of England.

WE have more than once referred to the policy of our ordinary Labourers' Friend Societies, and defended the conclusion that to offer money rewards for morality and benevolence is mistaken and absurd. The prize lists of these Societies do, as our readers know, contain offers of money to those who shall have brought up the largest families in respectability, and to those who shall have lived sober, chaste, and respectable lives in the same household for the greatest number of years; and to those who shall have maintained their parents or other relatives than their own immediate families under circumstances of the greatest difficulty.

Our objection to these offers has been read as if it referred to the whole system of rustic gatherings for the purpose of emulation and reward, than which, we believe, nothing can be more beneficial. No reasonable man can deny the advantage of all classes occasionally meeting. Such meetings are almost the only opportunities when the influence of the more intelligent and the more excellent of a neighbourhood may be brought to bear directly upon those who occupy a lower position in these respects: and if rewards for good conduct were the only way of gathering labourers and landlord, clergyman and tenantry together, we would advocate these prizes, notwithstanding their immediate uselessness, for the sake of this collateral advantage which they confer.

That such prizes are not necessary for this purpose there is, however, abundant evidence to prove. Every country flower show and every ploughing match is evidence of this. Such gatherings as Lord RADNOR annually holds at Coleshill, in Berkshire, and one of which has just been held, are a conclusive testimony on the same side. Prizes to the best mowers and shearers, and for the possession of agricultural skill of any kind, are more attractive than those for excellence of moral character, and the gathering is thus more perfect. The young and strong—precisely those whom it is most important to bring under the influence of kindly words and good advice—are brought together here; they feel sure of receiving justice as well as encouragement, for skill *may* be estimated accurately—it is measured by a result that is obvious to the senses; the morality of any course of conduct cannot be certainly determined, it is measured by its motive, which we cannot know, but which is certainly liable to be degraded by money rewards offered to good men. The annual gatherings instituted by Lord RADNOR

and his agent, Mr. MOORE, are, in our judgment, especially useful in this, that while success is attainable by any one who is allowed to enter the lists, by the exhibition of skill alone, yet the known character of those who organise these meetings, as well as the actual addresses given on the spot, all tend to impress the labourer with the value of personal character, with the all-importance of his personal relations both to GOD and man, as the only true ground on which success in life can be built.

A STEAM-CULTIVATOR for light lands, where shallow tillage is unavoidable, should be able (as we lately showed) both to scarify, drag, and plough, or perform something very much akin to these processes; and there would seem to be no good reason why the screw-wedge principle of the plough should not be employed to turn over thin slices of a soil which is all the better for squeezing. Let us now inquire into the special requirements of perhaps the most extended class of soils—those more or less friable loams, together with a vast variety of soils (excluding heavy clay) which are capable of moderately deep culture. As one description of land has not always the same depth of staple, it is impossible to point out in a general way the localities of all the soils to which we refer; but they may be found interspersed both in strong clay and light land districts; they occur upon the drift-beds covering various formations; on the green-sand oolite, new red sandstone; and form almost the whole of the alluvial tracts of deep land free from stones. Some are porous and friable; some are rather tenacious, and abounding with stones of considerable size; others consist of clayey and sandy gravel.

Now, the prime operation, engaging the chief share of the motive power of the farm, and demanding the greatest exactness and attention, is the breaking, loosening, and inverting of the staple by means of the plough. Lea ground, having remained unstirred for a considerable time, requires the most accurate manipulation, because of the twofold object of burying every trace of former vegetation, and obtaining a plentiful mould as a seed-bed. Stubble ground is generally more loose and friable, so that, whilst equal care must be taken to bury all superficial vegetable matter, no particular provision need be made for securing a surface-mould.

The most common depth of ploughing is perhaps a little more than 6 inches: but in ploughing land after sheep-feeding, and in cleaning the surface, half this depth is often chosen; and in turning over stubbles for fallow it is becoming more and more the custom to go 9 or 10 inches deep. A steam-cultivator, then, to be really useful, should dig, plough, or *in some way accomplish the slicing and complete inversion of the soil at the above variations in depth.* On deep loams and rich alluvial lands, where the subsoil is of good quality, trench-ploughing also is largely practised; by which a staple of cultivated earth is obtained at least one foot in thickness: a hard, tilly substratum has frequently to be broken in this way; soils are often deepened, indeed, by tearing up and disintegrating the very rock; and in all cases, in going deeper than the usual tillage, the implement is sure to encounter roots, stones, or other obstructions. The steam-digger should be able to effect *this difficult operation when required, and, if possible, more efficiently than by our present double-ploughing.*

But besides this deep ploughing (which is equivalent to the double-digging or trenching of gardeners), there is the operation of subsoiling some 16 inches deep (which represents what the gardeners call bastard-trenching), — that is, the substratum is broken and disintegrated without changing places with the top soil. It is very extensively practised upon lands having an impervious subsoil of a poor or noxious character,—as, for instance, where injurious salts of iron are contained in the pan formed by the cemented filtrations of the surface soil. The same tool which trenches or inverts cannot be expected to perform this mere stirring without lifting the subsoil: but as it is precisely in the deepest tillage (wherein our present traction implements depress their line of draught to an angle necessitating an enormous amount of motive power for propulsion), that steam-power should give us its chief help; and as the farmer will not have horses enough left for the purpose, when his surface-ploughing is done by steam—a steam cultivator ought to possess some modification of cutter or some simple adjustment of parts for *subsoiling.*

For all the above processes, *a slow motion* in the implement is indispensable. In the various after operations of reducing, pulverising, and cleaning, by some action akin to scuffling, harrowing, &c., *revolving tillers with a somewhat quicker speed* seem most adapted; and their capabilities should range from shallow paring of the surface or pulverising of a 6-inch staple, to the stirring of dug ground and rooting-up of Couch, &c., for 9 inches or even a foot in depth.

We may sum up our inferences by dividing methods of cultivation into two principal classes:—one comprising *the inversion of the soil to greater or less depth*, under the names of ploughing, trenching, &c., *capable of being accomplished by one form of implement;* the other class embracing *every species of stirring and pulverising* used in preparatory tillage—such as grubbing, harrowing, rolling, clod-crushing, and subsoiling (which seem to have essentially the same stirring and crumbling character), *all of which may be combined and embodied in a single machine.*

Provide British agriculture with these two engines, and the major portion of our arable lands will partake of the benefit. And with the main work done by steam, all secondary labours such as hoeing, seed sowing, ploughing drills for root crops, &c., will be accomplished by the horses still retained for the portage of produce and manures. *I. A. C.*

THE deeper cultivation, which we last week referred to as one cause of fertility in soils, is being rendered possible by drainage, and it is one of the collateral advantages of this great and essential agricultural improvement. The subsoil *was* the poison to the plant which it was thought to be, so long as filled with stagnant water, and impervious to the air. When a current was established through it the roots soon found their way below, and the plants above showed the advantage of the more extensive feeding ground thus obtained.

We must do little more than name land drainage as an observed cause of fertility—for it has been observed now so universally, and its benefits are so obvious in all cases of stagnant water, whether in stiff soils or light soils, that no one questions them. Though it is in point of fact the first step towards the reclamation of any land that is liable to fill with water, yet it comes last to be named in the order of benefits conferred upon the soil, for its principal advantage lies in the ability which is thus conferred on plants to use the fertilising matter already present in land. It is as it were the key by which access is obtained to a warehouse that may be full of vegetable food, but whether full or not is valueless so long as locked. By means of drainage, water runs through the land, gathering whatever soluble it finds, and the roots of plants by which it flows are fed. In land undrained, whether by Nature or by art, the water does not pass through the soil to feed the plants, it passes off the soil and leaves them starving. Land water-locked is barren, whether it be full of food for plants or not; and putting out of sight all the collateral advantages of drainage, the one great purpose which when drained the water serves—that of a carrier of food—is sufficient to account for the universal testimony of observation to the benefits of drainage.

The use of water as a vehicle of food to plants connects the subjects of drainage and irrigation. The volumes of the Society's Journal contain many references to the fertilising influence of irrigation; and the traveller in the vales of Hampshire and of Wiltshire cannot fail to have his observation drawn to the luxuriant growth of Grass which by means of it are produced.

The following detailed particulars relate to a case with which we are acquainted in another county. The extent of meadow is about 15 acres; before irrigation its value averaged 30*s.* per acre. In its original state the land rotted sheep, and was therefore unsafe except to put fat sheep on just before sending them to the butcher. The cost of bridges, levelling, channels, &c., in fact all the works preparatory to irrigation, amounted to as much as 15*l.* an acre. The annual cost of clearing water-courses, repairing hatches, &c., is 15*s.* per acre, and another 15*s.* per acre will cover the cost of making hay and other management throughout the year. The return from this outlay is in the form of a greatly increased value of spring and autumn feed, and in the safety of the land as regards the rot. The meadows are shut up early in May, and the crop is cut in seven or eight weeks. It averages 35 cwt. per acre. The value of the spring and autumn feed is at least 2*l.* per acre. The following is a statement of the amount:—

Dr. Cash		Contra	Cr.
35 cwt. of hay ...	... £5 5	Former value of the land	£1 10
Value of aftermath	... 2 0	5 per cent. on 15*s.* per acre	0 15
		Annual expense ...	1 10
		Profit	3 10
	£7 5		£7 5

In addition to this it must be remembered that the farmer has the advantage of carrying the crop off the land each year without impoverishing it; and this is in fact the real point of this case in its relations to the present subject. Observation thus bearing witness to the efficiency of irrigation, as the source and maintenance of fertility in soils.

ROYAL AGRICULTURAL COLLEGE.

THE sessional examination of students at the Royal Agricultural College was brought to a conclusion on Wednesday, 20th ult. The following are the results:—

FIRST CLASS IN PRACTICAL AGRICULTURE.

Arranged in order of merit.

1. Rome.
2. Wilson.
3. Kimber. Troutbeck.
4. Hollins. G. Wynne.
5. Burn.
6. Palmer.
7. Gee.
8. Field.
9. W. Colby.
10. Smith.
11. J. Colby.
12. A. Wynne.
13. Zamoyski.
14. Slater. Hawthorn.
15. Tousey.
16. Butcher.
17. Knox.
18. Lewis.
19. Fothergill.

The following were placed at the head of their class in each department, as under:—

ORGANIC AND AGRICULTURAL CHEMISTRY.
1. Thomas Rome. | 2. Jacob Wilson.

INORGANIC CHEMISTRY.
George R. Wynne.

GEOLOGY AND ZOOLOGY.
1. James Carter Hollins. Jacob Wilson. | 2. Thomas Rome. Robert Troutbeck. George R. Wynne.

VETERINARY MEDICINE AND SURGERY.
1. James W. Kimber. | 2. James Carter Hollins. Jacob Wilson.

CIVIL ENGINEERING.
1. James Carter Hollins. | 2. Jacob Wilson.

The Laboratory Prizes were adjudged as under:—

Classes 1 and 2 ... ... James W. Kimber.
Classes 3 and 4 ... ... George R. Wynne.

Commended.

Jean Zamoyski and Alfred Wynne.

Classes 5 and 6 ... ... Octavius Newry Knox.

Commended.

John C. Pickin, James E. Parsons, and Montague Martin.

The Essay Prizes were awarded to

Robert Troutbeck ... ... Subject, Wheat.
Jacob Wilson ... ... Subject, The Geology of the R. A. College Farm.
Thom. Fewster Wilkinson... Subject, English Agricultural Implements.

The R. A. College Certificate or Diploma was awarded to the following Students, who passed a very creditable examination in every Department:—

James Waving Kimber, of Fyfield Wick, near Abingdon.
James Carter Hollins, of Nottingham.
Jacob Wilson, of Woodhorn, near Morpeth.
Thomas Rome, of Groundslow, near Stone, Staffordshire.
Robert Henry Palmer, of Wyke Regis, Dorsetshire.

Home Correspondence.

Wheat in Hampshire.—As much has been said and written about the failure of the Wheat crop, I give you the history of it so far as this part of the county is affected. Our Wheat was put in generally pretty well, rather light than otherwise, but this I do not consider of much consequence as I have seen as good Wheat from a light seed bed as from a heavy, and the former is much less labour. The injury was done before the severe frost that set in about the middle of January, and arose from the ravages of a small insect about three-sixteenths of an inch long, eating out the heart of the then young and tender plant. I found it on my own and several other farms. My friends had attributed it to the wire-worm, until I showed them the insect; many of the fields looked pretty well till the withering frost and drying winds had passed over them. This was the case with a 16-acre field of mine sown after Clover, which was very much thinned all over; in every case of early inspection some of these little insects were found. After the frost none could be found. On searching I find that Mr. Curtis, in the "Agricultural Journal" fully describes them as larva of chlorops, and such I believe them to be. I have found them before, but never to the same extent as last winter. Since then, and within the last two months, the wireworm has committed great ravages in an 8-acre field of mine sown after Mustard fed by the sheep; it is quite half gone in several other fields. They have done considerable mischief, but for farmers to be complaining, with Wheat at from 70*s.* to 80*s.* per quarter, of course no one listens to them, but I would beg to remind your readers that there is a cause for these things; the year before last this district where I write did not average 12 bushels of Wheat per acre. Last year we grew about an average crop, and this year when you hear farmers say that much of their Wheat will not grow the seed, and another telling you on the 8th of June, at a market table, that he is to-day rolling and harrowing Wheat, you must judge but poorly of the growing crop. Saturday evening showers of hail and rain, and very cold to-night; Wheat markets here and at Southtown firm at last week's prices. Lent corn was looking well: short crops of Grass, &c. *James Eames, Lymington, June 17.*

Suggestions for Agricultural Statistic Returns for England and Wales, made on the 21st of October in each year, to be sent to the Collector within 14 days.—1. To appoint an intelligent agriculturist as inspector for each county holding not less than 50 acres in his own occupation, with a salary of 60*l.* to 100*l.* a-year varying with the extent of the returns. 2. In Hertfordshire there are 135 parishes, and according to Sparkman's statistic analysis the farmers are 1900, and the collation of that number of returns by the inspector would not occupy more than 10 or 12 days, and the whole of the returns might be submitted to the Board of Trade in the month of November; and as there would be only 52 counties (some of the largest of which it might be desirable to divide), the whole of the actual returns from the county inspectors might amount to 60 or 65, and the Board of Trade would be enabled to arrive at the combined amount of the returns within a few hours' labour on receiving them from the inspectors. 3. The mode of obtaining the returns should be

through the medium of the collector of assessed taxes, who is a fixed officer, and in the habit of sending schedules to each occupier; any portion of such returns may be returned to the collector, sealed and addressed to the county inspector—this would avoid any unpleasantness on the part of the farmer to an objectionable surveillance of his business by his neighbours, and there would be then little inducement to make unfair returns. 4. To confine the returns to farmers and occupiers of land not holding less than 5 acres of arable land or 10 of pasture. 5. The collector of the returns to be paid 1s. for each schedule, to be paid him by the overseers of the poor of the parish on the certificate of the inspector. 6. All parties refusing or neglecting to make such returns shall be summoned for penalties on the instructions of the inspector to that effect, and all fines paid to the overseers of the parish. 7. The inspector, for the more certainty of obtaining the returns by a given day, shall dispatch an agent into each hundred of the county to collect them from the returning officers. 8. Each collector of the returns shall send to the inspector a list of the names of the occupiers liable to make returns, with the number of acres in their occupation, and the required number of schedules shall then be forwarded to the collector, and the inspector, entering them in his books, would then have the lists in readiness to fill them up on the receipt of the returns and be enabled to ascertain who were defaulters. 9. The object of making the returns so late as in October is to have a clear and correct estimate of the results of the different crops after their maturity, for all crops, particularly Wheat, are liable to great injury in quality and quantity from bad harvest weather and the effects of mildew and blight when it is near maturity, for which no allowance could be made by any returns made in July or August, and the yield of the different crops would be to some extent ascertained by the quantities thrashed out previous to the 21st of October to be sent to market and for seed. 10. The expense of obtaining the whole of the returns to the government, if the collectors are paid by the parish authorities (which in many instances would not exceed a few shillings and in the largest parishes 3*l.* to 4*l.*) would be some 10,000*l.* to 12,000*l.* *Saml. Sandars, Hempsted, 28th June.*

Return of the number of acres of land in my occupation in this parish, and their respective modes of cultivation from October 21st, 1854, to October 21st, 1855.

Total occupation 300 *acres.*

Corn crops.	Acres.	Pasture, Meadow, and Woods.	Acres.
Wheat, winter sown ...	40		
" spring sown ...	20	Clover and Artificial Grasses	20
Rye	—	Meadow and Pasture ...	60
Barley	30	Hops	—
Oats	30	Wood...	—
Beans and Peas	10	Other crops	10
Other grain	—		
Fallows	20		90
	150	Woods	20
Root or other crops.			
Turnips	20	Total occupation—	
Potatoes	5	Corn crops and fallow ...	150
Carrots, Beet Root	5	Root crops	40
Tares and Vetches... ...	10	Pasture, meadow, &c. ...	90
Flax	—	Woods	20
	40	Acres... ...	300

Report of the quantity of old Wheat (if any) in granary or in stock, 1st September, the present year ... about 30 qrs.

Report of the supposed yield and weight per bushel of the present year's crops of Wheat and Barley.

WHEAT.	BARLEY.
Full crop	Full crop
Average	Average
Short	Short crop
Weight (about) 63 lbs. per bush.	Weight (about) 52lbs. per bush.

General report of the following crops.

Hay and Clover—Are they an Average crop? Full crop? Short?

Potatoes ... ... Average crop? Full crop? Short?

Turnips ... ... Average crop? Full crop? Short?

Return of the number of horned cattle, horses, sheep, and swine in my possession at the date of this return, and the number bred on my farm within the 12 months.

Stock on hand—		Bred on the farm during the year.	Number of fleeces of wool clipt the present year ... 150
Horned cattle .	30	.....	
Horses	14	.....	
Sheep	200	.....	
Swine	20		

I certify that the above return is correct to the best of my knowledge and belief. JOHN SMITH.

Hemel Hempsted, County of Hertford.

The return must be filled up (and may be sealed if desired, addressed to the county inspector, with the name of the occupier on the outside of the schedule), within 14 days after October 21st, that is on or before November 8th next, under a penalty of 40*s.*

Oct. 15th, 1855. WILLIAM SEERS, Collector of Returns for the Parish of Hemel Hempsted.

An important element of the returns would be the quantity of old Wheat in the farmers' hands on September 1st in each year. In 1853, Messrs. Sturge, of Birmingham, estimated the quantity at five million quarters, or 38 per cent. of the annual growth of 13 million quarters, whilst the writer's estimate was two million quarters, or 14 per cent., and on September 1st, 1854, as only 500,000 quarters, or some 12 to 14 days' consumption.

Steam Cultivation.—In my last letter to the *Gazette* I suggested that steam, on its right introduction to the field, would alter the "method" of operating on the surface soil altogether. This was apparently only a conjecture; hence let us proceed to examine whether such a supposition is baseless and without foundation, or whether it will be established. We can arrive at a conclusion on the point by first eliciting the conditions which must be fulfilled to render a steam-driven cultivator profitable to the farmer, and then proceeding to fulfil them. The first condition required is, that a steam-cultivator shall do more work, in less time, and at a less cost, than is now done. The second condition is, it shall be efficient to perform the work assigned. The third condition is, it shall be subservient not only to one, but to all the known and necessary operations of our field practice. Now it will at once be seen that if we can fulfil the first condition we fulfil the second and third by implication; that is, the two latter are contained in the first; hence let us address ourselves to the study of the first condition. We desire to do more work, in less time, and for less money (by a tillage machine) than it now costs. How is this to be effected? I will here affirm, only by a change in the "method" of operating in the field, and beg to support this affirmation by an appeal to our knowledge of all the past attempts at steam cultivation. From the earliest attempts down to the latest essays of Lord Willoughby d'Eresby and Mr. James Usher, it appears inventors have never succeeded in doing more work, in less time, than the plough; and as to fulfilling the third proposition of "at less cost," that has not been approached. Now it is also known, however varied may have been the mechanism, inventors have never attempted to work it on any other method than that of the plough; hence what deduction can we draw? Why, that the method of the plough is not suitable for the economical working of a steam-cultivating machine. Thus far I obtain negative evidence in support of my affirmation, that the "method of operating" must be altered. We will now proceed to establish my affirmation by positive evidence, and that will be by inquiring by what particular method or means a steam-driven cultivating machine could be employed on the surface soil, so as to fulfil the "condition" of doing more work in less time and for less money than is now accomplished by the plough, &c. Every mechanician knows it will be comparatively easy to construct or invent a machine to fulfil a certain method or purpose when we shall have first discovered what particular method or purpose it is to fulfil. The first question to be asked by an intending inventor would be—What is the characteristic or nature of the farmer's field practice to which we desire to apply the power of steam? Is it a question of distance, like the voyage across the Atlantic? No. Is it a question of velocity, like the railway business? No. Is it a question of depth, like the drainage business? No. Then what is it? Why a question of surface (or superficies), it being admitted that a farm of 300 acres of land represents a surface of 1,800,000,000 inches, whilst the depth to which our intended machine is required to operate is only 6 inches, or one three-millionth part in relation to the whole superficies of raw material composing the farm. Hence, as we have now discovered it is a question of surface we have to deal with, we will make a large machine, say 84 feet in length, and 5 feet in width. Now comes the important question—How are we to use it so as to fulfil the condition required, of doing more tillage work in less time and for less money than is now done by the plough, &c.? We know this machine will be heavy, and the labour to be encountered will be great. Hence we have to ask the question, What method or figure is the simplest and easiest by which to move a heavy weight the least possible distance, and yet perform the greatest possible amount of work? As Lord Bacon long since observed, in researches of this kind, we cannot do better than appeal to Nature to see how she manages in such cases. Art is only the handmaid to Nature. We are the artists, and the wisest course we can adopt is to aid and imitate Nature in our operations or contrivances. The question we have now to ask of Nature is, how does she operate when she desires to move a heavy body the least possible distance, whilst that heavy body shall execute or perform the greatest possible amount of work within a limited time? The natural examples I shall adduce to afford the required evidence shall be a cow grazing, a sheep feeding, a man broadcasting seeds, a man tethering a horse, a hawk beating for its prey. Feeling certain these several illustrations adopt the shortest course to attain their ends, we will consider their method of proceeding, and if we shall appreciate the motives prompting them, we will see whether we cannot employ the same means to fulfil our proposed labour of tilling the surface soil with a heavy body like a steam-engine. *Charles Burcham, London.*

Crops in Yorkshire.—The following notes on the appearance of the crops and prospects of the approaching harvest are the result of close personal observation over a large extent of land during the last 10 days. *Turnips.*—The Swedes first sown have suffered greatly from fly and much land has had to be sown twice. This failure has, however, sometimes arisen from the knavery of the seedsman. I had sown two kinds of Swedes in one field within a day of each other—one kind brairded beautifully; the other showed a very few sickly plants, which speedily disappeared under the operations of the fly, and I was obliged to sow the ground again, which I did with Yellows, and they are now finely up. Thinking something was wrong with this Swede seed I had 50 seeds put into fine mould in a flower pot, and placed it in a greenhouse; only 15 seeds grew, and these were feeble plants; so much for seed. Yellows and Whites generally are up, or coming up, and the matter is so exceedingly favourable now that we have great hopes of a good crop generally. *Potatoes.*—Thus far this valuable root looks very promising. *Wheat.*—This crop is this year a very unequal one. On good land in high condition the crop though late promises to be a full one. On poor land it is not only late but a very moderate crop. I was over several farms last week where the tenants do not expect more than half the yield per acre they had last year, and my own opinion on this point agreed with theirs. I have to-day (2d July) seen a field with many of the ears fairly out; this is the first I have seen in this neighbourhood; it will be fully ten days before Wheat here is generally shot, and as we usually reckon six weeks between the bloom on Wheat and the sickle there seems little prospect of our having harvest before the last week in August. Oats and Barley on good land promise a fair but not a great crop—on moderate and poor land the plants are short and a bad colour. Beans are not very long in the straw, but appear to be blooming well. The weather has been warm (75° in the shade) and showery during the last three weeks, and meadows have grown wonderfully; we now, by waiting a week longer than usual before we mow, expect to cut good crops. *Roaldus, Richmond, Yorkshire.*

Mr. Horsfall's Dairy Practice.—Being on a visit a short time ago in the neighbourhood of Otley, I took the opportunity of inspecting, in company with two or three other brother agriculturists, Mr. Horsfall's dairy establishment. Whatever may be the value of the system pursued in that establishment, whether the amount of butter produced be above or below the average, how far the administration of extra food may be conducive to the quality of the butter, &c. &c., these are questions upon which any one, having the data before him, is as competent as I am to form an opinion. Nor should I have ventured to trouble you with any observations on the subject, were it not that there appears to me to be one essential ingredient in the case which has somewhat escaped notice in the controversy concerning it which has arisen; and that is the condition of Mr. Horsfall's milch cows. Our observations showed us that by the practice of housing the cows from 6 P.M. until nearly 8 on the following morning, and by giving them during this time two meals of warm cooked food, a feeding as well as a milking process is carried on; and that this must very materially influence the economical part of the question, because the condition of the cows is such that in a fortnight or three weeks after being dried, they are ready for the butcher. The cows appeared to us to be about an average sort of short-horn. Their fresh condition however, the glossiness of their skins, and the unmistakeable appearance of health which they exhibited, are facts which should not be lost sight of in any criticism to which Mr. Horsfall's dairy practice may be subjected. *George Legard, near Malton, Yorkshire.*

Sowing Thick and Thin.—Since turning our attention to the growth of corn, though but tyros in this branch of agriculture, careful investigations have proved to us that from an extravagant full seeding of 2 bushels per acre of Wheat, or 3 bushels per acre of Barley and Oats, some of the seeds do, and must, by reason of its extreme thickness, and as a necessary consequence, fail to produce any ears or ear at all, and only one, two, and three diminutive ears are or can be possibly obtained from each grain, averaging only about two abortive or puny ears, and containing in both not 30 perfect grains. This need not cause great astonishment nor disbelief, and we speak it without fear of contradiction; for if it were so, 60 bushels per acre produce of Wheat and 90 bushels per acre of Barley and Oats, would of course consequently be often realised, viz., 30 times as much as was sown, which at first sight appears but little; but where is even this insignificant produce obtained from such proceedings? A correspondent on whom we can rely upon for truth, writes us from Inverness, "The practice of thin sowing has not come this way yet, grain being generally sown about 6 bushels to the acre!" How is this inadvertence to be accounted for—can it be in the difference of a Scotch acre, or the Scotch bushel? We contend that our growing crops from only 6 or 8 pints per statute acre with some 20 to 80 fine ears protruding from each grain or stub, hang dangling and wafting majestically in the summer's breeze as noble examples for larger establishments, cannot be beaten by anybody's else, or anywhere, except from a smaller quantity of seed even than this. *Hardy & Son.*

Dairy Statistics.—In my reply to "D," there is an error in the computation of Mr. Scott's average—"it would require 1957 quarts" should be "2154 quarts to produce the 196 lbs. of butter, and allowing a cow to produce milk 300 days in a year, which is less than my cows continue in milk, the result will be little more than 7 quarts per day; in my present stock of 18 there are not more than three giving so little," &c. *Thoma Horsfall.*

Societies.

ROYAL AGRICULTURAL OF ENGLAND.

MONTHLY COUNCIL, *July* 4.—Colonel CHALLONER, Trustee, in the chair. Twenty-five new members were elected.

FINANCES.—Mr. Raymond Barker, Chairman of the Finance Committee, submitted the monthly report of the accounts; from which it appeared that the current cash-balance in the hands of the bankers was 2668*l.*

JOURNAL.—Mr. Thompson, Chairman of the Journal Committee, laid on the table the first number of the Journal for the currrent year, and reported the following recommendation of the committee, which was adopted by the Council, namely:—"That a sum not exceeding 150*l.* may be expended by the Journal Committee in payments to authors of papers for the Journal during the next twelve months."

CHEMICAL INVESTIGATIONS.—Mr. Thompson then pre-

sented the following report from the Chemical Committee, which was also adopted :—

I. That one of the subjects of chemical investigation during the present year be :—
The Composition of Land-drainage Water.

II. That the subjects of the lectures by the consulting-chemist in the spring of 1856 be :—
1. The influence of climate on the action of manures.
2. The evaporation of ammonia from the soil, especially when recently manure.
3. A review of the progress of chemical science with reference to agriculture at home and abroad.

CARLISLE MEETING.—Mr. Fisher Hobbs, Vice-Chairman of the General Carlisle Committee, reported the completion of the arrangements at Carlisle in reference to the landing of the cattle and implements, and the approaches to the show-yard. He also reported the acceptance of a tender for the Pavilion dinner, made by Mr. Breach, of the County Hotel at Carlisle.

CHELMSFORD MEETING.—The Council accepted the offer of Mr. Henry Manning, of 251, High Holborn, to undertake such works as the Society may require for its Chelmsford Meeting in 1856, on the same terms as for the Carlisle Meeting this year.

IMPLEMENT JUDGES.—Mr. Fisher Hobbs also reported from the Implement Committee their recommendation of Judges in the Machinery and Implement Department of the Carlisle Show, which recommendation was adopted by the Council.

PARIS SHOW.—Mr. Fisher Hobbs took that opportunity of stating that Mr. Milward having been appointed by the Council at their last monthly meeting the English juror for short-horned and other cattle, and he (Mr. Hobbs) the English juror for sheep and pigs, at the Agricultural Show recently held in Paris, he could not withhold the expression of his admiration at the excellence of that first international gathering of the friends of agriculture from every part of the civilised world, and his conviction that the happiest results would in every point of view result from that meeting, which he believed would form a new era in agricultural progress.

AUTUMN VACATION.—On the motion of Mr. Raymond Barker, seconded by Sir John Villiers Shelley, Bart., M.P., the following resolution was carried unanimously, namely, "That the business of the Society shall be so arranged as to afford the Secretary and Staff their usual vacation between the 20th August and the 20th October."

The Council then adjourned.

Country Meeting business of a Special Council to be held at the Guildhall, Carlisle, on Friday in the week of the show.

LECTURES.—July 11, at Noon, Professor Simonds, "On the Physiological Conditions affecting the quantity and quality of Milk secreted by the Cow under different circumstances of feeding and management." July 18, at Noon, Professor Way, "On the use of Fish as Manure."

Reviews.

The Yester Deep-land Culture. By Henry Stephens. Wm. Blackwood & Son, Edinburgh and London.

There is no better instance of the advantages of that tilth and depth of soil which were referred to last week in the leading section of this Paper than is recorded with perhaps unnecessary detail in this little book. The Marquess of Tweeddale appears at great expense and with the most confident energy in carrying out his plans to have succeeded in entirely renovating and remodelling the estate which is here described :—

"The characteristic distinction of the Yester system of farming is the very substantial and permanent nature of the treatment which the land receives. It does not, like that pursued with the common plough, glaze the surface and increase the adhesiveness of the furrow-slice in strong land in a moist state; it is not the mere scarification which the grubber gives to the surface soil; it is not the tearing into shallow stripes which the ordinary subsoil-ploughs effect in the subsoil;—but it is the laying over of the surface soil in a deep, broad, and broken furrow-slice in immediate precedence of the up-raising of the subsoil from a great depth, as far as, and no farther than, to mix it completely with any desired proportion of the surface soil."

The author of this book will probably be generally considered to have referred to the Yester culture as if it were the development of entirely new principles in agriculture, which it certainly is not, rather than as a striking instance of the results following a more perfect performance of the ordinary operations of husbandry. In the following passage, however, the difference between this and the ordinary farm practice is shown to be one merely of degree :—

"The only object in using the plough, and some other large implements, is the pulverisation of the surface-soil and part of the subsoil. The ordinary and the Yester treatment of either soil both aim to attain that object; but the difference in the two methods consists of this, that the ordinary practice attains only an imperfect and temporary pulverisation of a little more than the surface soil, 7 or 8 inches deep—for subsoiling is very seldom practised—while the Yester plan attains an effectual and durable pulverisation of both surface-soil and subsoil to the depth of 22 inches. Now the state of the subsoil sensibly affects the condition of the upper soil. If it be wet, the upper soil will also be wet; and draining is used to dry both. If it be dried by draining, but left hard, the roots of plants meet with such obstruction in it as to stint the growth of the plants themselves. The Yester deep land culture seems, therefore, on comparison, a more perfect system, inasmuch as the treatment of the surface-soil in connection with the subsoil is concerned with vegetation; whereas the ordinary system generally leaves the subsoil undisturbed beyond thorough draining it.

"The pulverisation of the subsoil, and its mixture with the upper soil, is thus the keystone of the Yester deep land-culture. This system is as simple as it is durable. It cannot be conducted with the implements in common use, but the implements which effect it are as simple as those in common use. It is also a cheap as well as a durable operation. It is, moreover, a valuable as well as a cheap process. Its value may be estimated by the products obtained. Those products exhibit a large increase, and when the previous quality and condition of the surface-soil and subsoil are borne in mind, the increase exceeds the expectation of the most sanguine cultivator."

The drainage, deepening, and pulverisation of the Yester soil have been efficient hitherto almost unaided by the addition of artificial manure, and the increased crops are the result almost wholly of the natural sources of fertility which every soil contains within itself when its substance is thoroughly brought into contact with the air and the rain water. The history here given is the more instructive, therefore, on that high value of mere tillage which Mr. Smith's experience and that of Jethro Tull have already well established. How great the influence of this mere tillage is will be gathered from the following instances :

"The Moss Bents field, which had originally been stiff clay, containing 15¾ imperial acres, was in Oats in 1850, which produced 29¼ bushels the acre. It was bare-fallowed and subsoil-trench ploughed in 1851, and in 1852 produced 61 quarters of good Wheat, and 2½ quarters of light, equal to 38½ bushels, and realised above 11*l.* the acre. The Long Bents field, of sandy clay soil and subsoil, containing 16 acres, was in Oats in 1848, which produced 65 quarters, equal to 37 bushels the acre. In 1849 it was bare-fallowed and subsoil-trench ploughed, and in 1850 it yielded 58 quarters of good Wheat, and 4 quarters of light, realising 10*l.* per acre. In 1851 it was in Grass, and in 1852 the lea was deep ploughed with the Tweeddale plough 15 inches deep. In 1853 it was Oats, which produced 104½ quarters, equal to 61¼ bushels the acre. In 1854 it carried an excellent crop of Turnips, the weight of which was not ascertained.

"The Wa' Tree Park, which was originally of stiff tenacious clay soil and subsoil, containing 19¾ imperial acres, was in Oats in 1850, which yielded 60 quarters, equal to 28¾ bushels the acre. In 1851 6¼ acres were bare fallowed and subsoil-trench ploughed, and 13½ acres subsoil-trench ploughed and made with Turnips. In 1852 the 6¼ acres produced, of Wheat, 28½ quarters of good, and 3½ quarters of light, realising 15*l.* 7*s.* 4*d.* the acre; and the 13½ acres produced Barley, which averaged 31¼ bushels, and realised 6*l.* 0*s.* 10*d.* the acre.

"The Holmes Park, which was originally of very poor stiff tenacious clay soil and subsoil, and containing 24 acres imperial, was in Grass in 1850, and was deep ploughed, 15 inches, with the Tweeddale plough in winter. It carried Oats in 1851, which yielded 108 quarters, equal to 43¼ bushels the acre. In 1852 it was subsoil-trench ploughed 19 inches deep for Turnips, which were a fair crop. In 1853 it was Barley, of which 79½ quarters were good and 18 quarters light, equal to 39 bushels, realised 9*l.* 17*s.* 6*d.* the acre.

"The Kitchen Croft, which was originally of stiff sandy clay soil and subsoil, containing a large number of boulders, and consisting of 8¼ acres imperial, was previously let at 8*l.* 15*s.* for the field, and it was thorough drained in the winter of 1848. In 1849 it was bare-fallowed and subsoil-trench ploughed 19 inches deep. In 1850 it carried Wheat, of which 24 quarters were good, 5¼ quarters light, equal to 34½ bushels, and realising 8*l.* 8*s.* 8*d.* the acre. In 1851 it was Turnips, which were good. In 1852, Barley, of which 40 quarters were good and 3¼ quarters light, equal to 53 bushels the acre, and was sold for 10*l.* 12*s.* 10*d.* the acre.

"The land on Broadwoodside farm was lined after being thorough-drained and subsoil-trench ploughed. At first the quantity used was 48 bolls, or 288 bushels, to the imperial acre; but it was soon found that 30 bolls, or 144 bushels, had an equally good effect upon the land, and that was the quantity which the farm mostly received.

"The land on Danskine farm was not subsoil-trench ploughed at all, and only deep ploughed with the Tweeddale plough, with three horses yoked abreast in the compensation swing-trees, to the depth of 14 or 15 inches, as the subsoil was of such an open nature as not to require further pulverisation. Sandy Oats were the kind first used on this farm, but were given up for the Hopetoun variety, in consequence of the yield being greater and the straw better on the improved soil. The poor clay soil of Danskine was covered with a black vegetable matter, obtained from the bottom of the Loch of Danskine after the water had been drained off. This vegetable substance was laid on the land, at the rate of 180 cubic yards per imperial acre, upon the stubble in autumn, cut small with the spade, spread, and ploughed in with a 14-inch furrow with three horses in the Tweeddale plough. At first the quantity laid on was 120 cubic yards the acre, but latterly it was increased to 180. Such a large quantity of matter literally covers the surface when spread over it, that its black colour imparts a darkened hue to the soil after incorporation with it. The cost of digging this matter—lifting it out of the bog by means of a railroad and steam-power, carting it on the land, spreading it, with tear and wear of machinery, and interest on cost of machinery—is 7*d.* per cubic yard; so that the cost of manuring an imperial acre with it was from 3*l.* 10*s.* to 5*l.* 5*s.*"

The book records fully both the natural conditions as to climate, soil, and subsoil of the experiment and the means employed in the course of it—thorough drainage, deep ploughing, subsoil-trench ploughing, and the course of farming now pursued. The implements used are also described in full detail. And the whole history is given with such completeness that any of our readers will be able both to judge of the propriety of following the Marquess of Tweeddale's example, and to set about the execution of his invention as soon as he has proved it.

We add a paragraph upon the other services to agriculture for which we are indebted to the owner of the Yester farms.

"The Marquess has not confined his exertions to the amendment of the surface soil and subsoil only. A finer class of plants—one higher bred, if the phrase may be allowed in reference to plants—seems requisite to occupy an amended condition of the surface soil and subsoil. Accordingly, his lordship has directed his attention to effecting such a change on the constitutional habits of the cultivated plants as to suit their growing existence to the altered and emended condition of the surface soil and subsoil. From its very terms such an experimental improvement does not seem an easy task to undertake; but the results show, as far as they have been completed, that his lordship has successfully accomplished it.

"The first cultivated plant that has been subjected to experimental improvement by his lordship is the Turnip. Distinct species of Turnips are familiarly spoken of by farmers throughout the country, and each of them possesses such marked characters as to render a confusion of their identity most improbable. No farmer confounds a White Globe Turnip with any of the yellow kinds, nor either with the Swede—regarding the last plant as a Turnip in the common acceptation of the term. But, nevertheless, such a number of varieties have had their origin from each of the above species, that when one of the species is referred to in a district its exact variety is not understood alike by a resident and a stranger. It seems impossible that such an identity of character in a variety should be established as to be generally understood; for one variety may grow better in one district than in another, and one variety better than another in the same district, and in consequence the better varieties obtain the preference, and are retained for culture. But, nevertheless, one variety must be more valuable as food than another from the same species, in whatever district, because two or more best things cannot spring from the same source; and hence the variety that possesses the largest proportion of valuable properties for feeding in one district, will possess the same in another district, provided the same conditions of soil, culture, and skill are used in its growth.

"With reasonings such as these the Marquess first took the Purple-top Yellow Turnip to experiment upon, with the view of rendering it of as fine a form, as high a specific gravity, and of as valuable feeding property as it was capable of attaining. The experiment has already proceeded so far as to secure the form; the feeding property has nearly been reached; and the highest specific gravity has yet to be attained. The form is perfect for a Turnip, the bulb being a beautiful oblate spheroid; the colours are distinctly marked, dark purple on the upper half, and buff-yellow on the lower. The root is long and small; the skin thin, fine, and oily; the shaw small at the neck, and set upon the uppermost part of the bulb; the leaves expanding, to receive the influence of the atmosphere. The growth of the plant is continued and rapid. Its constitution is strong, and general health vigorous. Its specific gravity has increased largely. When the experiments began it was 820, taking water at its usual standard of 1000. It has now acquired a specific gravity of 970, and is expected to go on increasing till it reach, or it may be exceed, that of the Swede. By selecting fine bulbs, indicating large size and heavy weight, and transplanting them in a favourable situation for growth, and selecting the best grown and best matured pods of the seed, it is presumed that their properties may be propagated and extended indefinitely.

"An enlarged bulb and increased weight over an acre insures a heavier crop; and hence that of 1854, in Steel's Walls field, Yester Mains, has reached 50 single horse cart-loads of 13 cwt. each; that is, 32½ tons to the imperial acre. Mr. Gibb, of Cupar-Fife, sowed 5 falls Scotch in 1854, with seed of the Purple-top Yellow Turnip raised by the Marquess, and the return obtained was about 50 double-horse cart-loads at from 15¼ to 15¾ cwt. each, which is about 39 tons to the imperial acre; besides two double-horse cart-loads of Swedes, whose seed had been sown along with about 1 lb. of that of the yellow Turnips, to make the small quantity of the latter go farther over the ground, and the Swedes plants were thinned out, except in the spaces which the yellow did not fill up. Both these are uncommonly large crops of Turnips.

"Similar treatment of the Swede and of the White Globe Turnip as has been given to the Purple-top Yellow, might no doubt produce as striking results in their case as in that which has just been related."

But we must not at present pursue the matter further. Mr. Stephens deserves our thanks for laying in such full detail the particulars of a very interesting agricultural experiment before the world.

Miscellaneous.

Imperial Present to the Manchester and Liverpool Agricultural Society.—The committee of management of the Manchester and Liverpool Agricultural Society lately presented to the Emperor of the French a fine Cheshire cheese. On Tuesday last, Mr. T. B. Ryder, the society's secretary, received, through the French Consul in this town, a handsome gold medal for the committee from the Emperor, which was accompanied by a letter of acknowledgment and thanks from General Rolin addressed to Mr. White, Mayor of Warington, and to Mr. Ryder, as the parties who presented the cheese.

Calendar of Operations.

JULY.

WEST SUSSEX, *July* 4.—We have had very little rain through June, and the land is now very dry; but most crops look well on the rich low lands. Wheat hardly ever looked better. It is now in full bloom, and the weather suits it well. There has now and then been slight signs of rust, but not to any extent, and there are a few black ears (*Uredo segetum*), but not so many as last year. But it is the common belief that a year that produces them is a good yielding one. On the higher lands the crop is not so good; the frost has thrown it out of ground too much, and there have been cases where it was not thought fit to leave it, it was so thin. I see Messrs. Hardy disapprove of doing away with a crop though it may be thin, and adduce their success in thin sowing to prove that it is unwise. But I think they omit to observe that thin seeding is one thing, and a crop thinned by disease is another. Suppose one-half is killed by wireworm, frost, or any other cause, is it not likely that the other half is hurt? And the consequence is, that though there may be as many plants left per acre as they think sufficient, they are all sickly and are wisely done away with. This is a point that I think the warm advocates on both sides ought to keep in view. And perhaps the thin seeders may be nearest to the truth, because as they put in little there is no struggle between the plants at first; they have each space to spread their roots and get food to make them strong and of a good constitution. Whereas, when there is too much seed put in, the plants are not able to get proper nourishment at first, and so grow up weaker, and when the day of trial comes, while the one stands strong, defying all attacks, the other gets cut down. And now it is that victory is claimed by each party. The thin seeder says, "I had a good crop and plants enough from 2½ pecks of seed." And the thick seeder says, "How can that be? I had not enough from 2½ bushels." One says he means to use less seed; the other, that he must use more! In connection with this I will notice the subject of top-dressing Wheat with guano, &c., in the spring. Every experience that I have had tends to prove that this is only the second best method of using it. My decided impression is, that it ought to be applied at the time of sowing. We have this year used it at both periods, but that at time of sowing had such an effect as can be seen so far as the field is visible, while that used in spring has had comparatively little effect. The spring was dry, which was against it; but that may often happen, and so it is best not to trust to it when the other is certain, and to get a healthy plant is of course half the battle. Thinking to render a sickly plant strong by giving it strong food is like applying the same doctrine to a consumptive person, if you put it within his reach he cannot take it; but if the constitution is all right, he can avail himself of all good cheer that is put in his way: so with the plant; let it be healthy and strong in its early days, and it will spread its root with vigour and lay hold of everything that can be of use to it, and will thrive where others would starve. Barley is coming on well, and is nearly all in ear; in some places where the land was trod in wet weather by sheep, and ploughed up lumpy, it has not come up regularly, but such are but rare instances, as the winter was so dry. Oats and Tares are good. Turnips have in many places been carried off by the fly, and some have sown three times; but we repeat our experience that where a liberal supply of good superphosphate has been used, the fly will do little harm: but perhaps, generally speaking, the less of what are called Turnip manures, Mangold manures, and other specialities are used, the fewer will be the disappointments. We have tried some Wheat manure, as well as some flesh manure called animal guano, against good Peruvian guano, the same value of each on Wheat; but it needs no figures to tell which is best, that may be seen at five miles distance; and I fear it will be long before we have a manure equal to guano at half its price. Peas are good, and show no signs of blight, and will soon be ripe. Beans have not yet shown blight, but are a short crop—they have flowered well; this part of the country does not seem well adapted for them. We are now in the middle of hay-making, for which the weather is good; the crop is very light: the price must be high next year, or some substitute must be found. Turnip sowing is finished, except where a little may be put in after Tares mown, and the first sowings are now fit for the hoe. Mangold is hoed, and looks well, but the land is so dry about it, that it must soon come to a stand-still if we have no rain. Feed is short, fast burning up. *G. S.*

Notices to Correspondents.

CARCASE WEIGHT OF CATTLE. The difference between the live and dead weight of cattle varies exceedingly, according to the breed and condition of the animal; from 9 to 13 out of 20 of the living animal may be meat.

MUSH: *G. A. B.* says, add half a tea-spoonful of salt to half a pint of Indian corn meal, gradually mix with a quart of cold milk or water, boil for 10 or 12 minutes, eat with sugar, molasses, or jam. Another recipe for porridge: Of a spoonful each of Indian meal and Wheat flour, make thin batter, pour it into a quart of boiling milk and water, salt to taste, boil 10 minutes.

THE FARMER'S RAIN GAUGE: *C R Y.* You must understand that the weight of a cubic inch of water forms the basis of every calculation. At 62° (so says Dr. Fownes, "Chemical Elements,") it is taken at 252.45 grains; but to avoid any decimal fractions at varying degrees of temperature, 252½ grs. 252.5 are assumed as a standard. A square tin funnel, precisely 8 inches across, painted, is to be chosen in place of a round conical one, because its square being 64 superficial inches, is certain at all times. The tube is passed through the neck of the receiver, which may be a pint or small quart wide-mouth bottle, made firm, and secured by a quantity of sand in a deep garden pot, sunk to its rim in an open part of the ground. The rain water, be its quantity more or less, ought to be measured once in the 24 hours, or oftener, in the interval between heavy showers; and this can be done by employing the glass measures that are sold by dispensing chemists, containing from one to eight fluid ounces; because a cubic inch of rain water occupies almost precisely four fluid drachms (half an ounce of the drachm spaces marked on the glass. The 26 ounces alluded to fell on the 13th of May, and this volume divided decimally by 64 gives 0 in. 40 cents., or a mere trifle more, as the product of 13 measured inches of rain distributed over a square surface of ground comprising 64 square inches.

To Constant Reader. Farm implements and manures for use experimentally are toll free.

WHEAT: *Minutus.* Mr. Eames, of Beauly Farm, Lyndhurst, Hants, may possibly be able to supply you with Morton's Red Straw White Wheat.

PARKES' STEEL DIGGING FORKS & DRAINING TOOLS.

MESSRS. BURGESS AND KEY, as Mr. PARKES' Wholesale Agents for England, have always in stock a large assortment. These Forks and Tools are now in use by upwards of 1000 of the Nobility and Farmers, members of the Royal Agricultural Society, who pronounce them to be the best ever invented, and to facilitate labour at least 20 per cent. Price Lists sent free on application, and Illustrated Catalogue of the best Farm Implements, on receipt of eight postage stamps.

GALVANISED WIRE GAME NETTING.—7*d.* PER YARD, 2 FEET WIDE.

		Galvanised.	Japanned iron.
2-inch mesh, light, 24 inches wide	...	7*d.* per yd.	5*d.* per yd.
2-inch " strong "	...	9 "	6½ "
2-inch " extra strong "	...	12 "	9 "
1⅝-inch " light "	...	8 "	6 "
1⅝-inch " strong "	...	10 "	8 "
1⅝-inch " extra strong "	...	14 "	11 "

All the above can be made any width at proportionate prices. If the upper half is a coarse mesh, it will reduce the prices one-fourth. Galvanised Sparrow-proof Netting for Pheasantries, 3*d.* per square foot. Patterns forwarded post free.

Manufactured by BARNARD & BISHOP, Market Place, Norwich, and delivered free of expense in London, Peterborough, Hull, or Newcastle.

SAMUELSON'S REGISTERED LAWN MOWING MACHINES. To cut 16, 19, 22, and 25 inches wide. The Registered Improvement renders unnecessary the great care requisite in the handling of these Machines on the old plan. All that is now required can be done *by any unskilled labourer*, who has only to push the Machine before him, the Registered Adjustment insuring a clean cut of uniform height, and preventing the knives from cutting into the soil, however uneven the ground may be. Illustrated Price Lists, with copies of Testimonials, and a Catalogue of his other Agricultural Implements, may be procured, post-paid, on application to the Manufacturer,

B. SAMUELSON, Britannia Works, Banbury, Oxon.

The above may also be procured at the principal Agricultural Implement Depôts in London, and of all respectable Ironmongers and Seedsmen in the country.

WARNER'S SWING WATER-BARROW (TO HOLD THIRTY GALLONS)

Is intended for all large Establishments where much watering is done by the watering-pot. By its use much time and labour of the Gardener are saved, particularly where the Tank, Pond, or Pump, is at a distance from the garden. May be obtained of any Ironmonger in town or country for 3*l.* 3*s.*

Manufactured by

JOHN WARNER & SONS, 8, Crescent, Jewin Street, London.

(Fig. 1.) (Fig. 2.)

No. 14	"	30	"	"	45	"	...	5 18

A large assortment of every description of Garden Syringes, Pail Engines, Conservatory Pumps, &c., kept in Stock.

No. 1, Plain Syringe, with rose and jet, diameter of barrel, 1¼ inch, 14*s.* 3*d.*; No. 2, do., diameter of barrel, 1⅜ inch, 12*s.*; No. 3, do., diameter of barrel, 1⅜ inch, 10*s.* 6*d.*

READ'S SYRINGE, with two roses and one jet, 19*s.*

J. TYLOR & SON'S Horticultural Apparatus may be obtained at these prices from any respectable Ironmonger or Seedsman in town or country, through whom alone they will be supplied, and of whom Drawings and Prices may be had.

N.B. Cost of carriage, &c., not included in these prices.

J. TYLOR & SON'S Manufactory, Warwick Lane, Newgate Street, London.

J. TYLOR AND SON'S REGISTERED GARDEN SYRINGE.—Small size, for Amateur use, **21s.** each. Large size, for Gardeners' use, **25s.** each.

Extra for Telescope Tube as shown in engraving for watering plants on stands at a height of 8 feet, so that any quantity of water can be deposited in the pot without wetting the leaves, 10*s.*

By a simple arrangement this Syringe is rendered more effective than any portable Conservatory or Garden Pump ever offered to the public. It is equally adapted for Garden or Conservatory use, and is capable of discharging twice as much water in a given time as any other Syringe now in use. The arrangement consists in attaching a small flexible suction tube to the barrel of the Syringe, through which it is filled with water at every discharge of the previous contents. By this means the Syringe is always charged, and the pull-up stroke of the piston rendered perfectly easy, it having, indeed, no work to do, the barrel being previously full of water. Being thus made self-supplying, a great saving of labour is effected; and the necessity of stooping to fill the syringe at every discharge being done away with, the direction of the water can be maintained for any length of time. It is perfectly cleanly in its action, as it is not possible for any water to get on the outside of the barrel, which is a well-known inconvenience attendant on the use of every other Syringe. Its construction is perfectly simple, and cannot get out of order; the ground in ball valves and fittings used for filling all other patent Syringes being entirely superseded. To be had of any respectable Ironmonger or Seedsman in town or country.

J. TYLOR & SONS, Manufacturers of Horticultural Apparatus Warwick Lane, Newgate Street, London.

N.B. These prices do not include carriage, package, or expense of delivery in the country.

CARSON'S ORIGINAL ANTI-CORROSION PAINT, specially patronised by the British and other Governments, the Hon. East India Company, the principal Dock Companies, most public bodies, and by the nobility, gentry, and clergy, for out-door work at their country seats. The Anti-Corrosion is particularly recommended as the most durable out-door Paint ever invented, for the preservation of every description of Iron, Wood, Stone, Brick, Compo, Cement, &c., work, as has been proved by the practical test of upwards of 60 years, and by the numerous (between 500 and 600) testimonials in its favour, and which, from the rank and station in society of those who have given them, have never yet been equalled by anything as the kind hitherto brought before the public notice.

Lists of colours, prices, together with a copy of the testimonials, will be sent on application to WALTER CARSON & SON, 9, Great Winchester Street, Old Broad Street, Royal Exchange, London.

No Agents. All orders are particularly requested to be sent direct.

DO YOU BRUISE YOUR OATS YET?—One bushel of Oats when Crushed will make two. Great saving.

OAT BRUISERS, Chaff-cutters, Ploughs, Threshing Machines, Flour Mill Carts, Corn Dressing do., Horse and Steam Machinery put up, &c. Book on Feeding, 1s.

M. WEDLAKE, 118, Fenchurch Street, London.

COWS.

HARVEY'S CELEBRATED COW DRINKS, 1s. each, have been used with great success. Plain directions are given with each Drink for the treatment of most diseases incidental to Cows, for which they will be found a safe and effectual remedy. One Drink given at the commencement of the Tick, or Feet and Mouth Distemper, will perfectly eradicate it in a few days.—Compounded by R. HARVEY, Veterinary Surgeon, Macclesfield, Cheshire. Sold by all Medicine Vendors Wholesale Agents, BARCLAY & SONS, and MARSDEN & SONS, London.

IMPORTANT TO GROWERS OF ROSES.

NEWLY-INVENTED APHIS BRUSH, or GREEN FLY DESTROYER.—The attention of Florists is particularly called to this Cheap and Ingenious Instrument, invented by the late E. S. BULL, of Colchester, which, in a very simple and easy manner, instantly cleanses the Rose from that destructive insect the Green-fly (or Aphis), without causing the slightest injury to the bud or foliage.

Price 2s. 6d. each, or free by post, 4s.

MANUFACTURED BY
JOSLIN AND SONS,
IRONMONGERS, Colchester.

Retailed by all the principal Ironmongers.

HORTICULTURAL WORKS AND HOT-WATER APPARATUS MANUFACTORY.

KENSAL GREEN, HARROW ROAD, LONDON.

JOHN TAYLOR AND SON beg to call the attention of the nobility and gentry to the very superior manner in which they Erect all kinds of Conservatories, Vineries, Greenhouses, &c., combining every improvement with elegance of design, and durability of materials and workmanship.

Their VENTILATING APPARATUS for the Fronts and Roofs of Houses has given the highest satisfaction. Churches, Chapels, Schools, Entrance Halls, Public Buildings, &c., heated with Hot-Water Apparatus in a most economical and efficient manner. J. T. & SON have great pleasure in referring to numbers of the nobility and gentry by whom they are extensively engaged.

HORTICULTURE IN ALL ITS BRANCHES.

JOHN WEEKS & Co., King's Road, Chelsea.

HOTHOUSE BUILDERS.

THE NOBILITY AND GENTRY about to erect Horticultural Buildings, or fix Hot-water Apparatus, will find at our Horticultural Establishment and Hothouse Works, King's Road, Chelsea, an extensive variety of Hothouses, Greenhouses, Conservatories, Pits, &c., erected, and in full operation, combining all modern improvements, so that a lady or gentleman can select the description of House best adapted for every required purpose.

The HOT-WATER APPARATUS, which passes through all the Houses and Pits, affording both top and bottom heat, is in constant operation and particularly worthy of attention.

Many of the Houses and Pits are of wide and lofty dimensions and together equal in length 1000 feet. They are all effectually heated by *one boiler*, which, during the severe winter months does not cost in labour and fuel more than 3s. 8d. per day, and the apparatus is so arranged that each House or Pit may be heated separately and to the required temperature. The splendid collections of Stove and Greenhouse Plants are also in the highest state of cultivation, and for sale at very low prices. Also a fine collection of strong Grape Vines in pots, from eyes, all the best sorts.

Plans, Models, and Estimates of Horticultural Buildings, &c. Catalogues of Plants, Vines, Seeds, &c., forwarded on application to JOHN WEEKS & Co., King's Road, Chelsea, London.

BLACK JAPAN VARNISH.—This article will be found from its durability and cheapness of the greatest utility for Painting Hurdles, Wire-work, Palings, Gates, Fences, &c., and out-door work of every description, whether of Wood or Iron. Its value has been proved by the test of time. It should be well stirred up before using and applied cold. This Varnish will retain its quality for any length of time, provided the cask be kept closed.

May be obtained through any ironmonger; or of JOHN WARREN & SONS, 8, Jewin Crescent, London.

N.B. Sold in casks containing 14 or 7 gallons, at 2s. per gallon. Casks (which cannot be returned), 5s. and 3s. each.

GLASS FOR CONSERVATORIES, GREENHOUSES, PIT FRAMES, ETC.

JAMES PHILLIPS AND Co. have the pleasure to hand their present reduced prices of Glass for Cash:—

No. 39, Oxford Street (corner of Newman Street); 1, 2, and 3, Newman Street; and 4 & 5, Perry's Place.

THE SUCCESSFUL RESULTS OF THE LAST HALF CENTURY HAVE PROVED BEYOND QUESTION THAT

ROWLAND'S MACASSAR OIL possesses peculiarly nourishing powers in the growth, restoration, and improvement of the human Hair, and is now universally acknowledged to be the cheapest, and superior to all other preparations for the hair. It prevents it from falling off or turning grey, strengthens weak hair, produces a thick and luxuriant growth, cleanses it from scurf and dandriff, and makes it beautifully soft, curly, and glossy. In the growth of the Beard, Whiskers, Eyebrows, and Moustachios, it is unfailing in its stimulative operation. For children it is especially recommended, as forming the basis of a beautiful head of hair. Price 3s. 6d. and 7s.; Family Bottles (equal to four small), 10s. 6d.; and double that size, 21s. CAUTION.—On the wrapper of each bottle are the words, Rowlands' Macassar Oil, in two lines.—Sold by A. ROWLAND & SONS, 20, Hatton Garden, London, and by Chemists and Perfumers.

A TREATISE ON ASTHMA AND DISEASES OF THE HEART.

London: LONGMAN, BROWN, GREEN, & LONGMANS.

NEW AND ENLARGED EDITION OF DR. LINDLEY'S THEORY OF HORTICULTURE.

Just Published, in 8vo, with 98 Woodcuts, price 21s. cloth,

THE THEORY AND PRACTICE OF HORTICULTURE; or, an Attempt to explain the chief Operations of Gardening upon Physiological Grounds: being the Second Edition of the "Theory of Horticulture," much enlarged. By JOHN LINDLEY, Ph.D., F.R.S., Corresponding Member of the Institute, Vice-Secretary of the Horticultural Society, Professor of Botany in University College, London, &c.

"The First Edition of this valuable work was issued in 1840, since which time it has had an extensive circulation, and has been translated into the German, Dutch, and even Russian languages. Being more particularly restricted to principles, however, the author at length resolved to render the work more generally interesting and useful by a more frequent reference to practical operations. He has thus greatly extended the matter, by supporting the physiological doctrines with an appeal to facts familiar to cultivators, or which ought to be; and the result is a still more interesting and popular compendium of the principles and practice, or the science and art, of horticulture."—*Builder.*

"This is a Second Edition of the "Theory of Horticulture," with the addition of a large quantity of practical matter, introduced to show how entirely scientific principles and good cultivation correspond. The volume contains about four times as much matter as the first edition . . . . Although very large additions are made to every chapter, while many passages in the first edition have been wholly struck out, it may be proper to say that the greatest changes are those which relate to vitality, climate, domestication, ventilation, propagation, pruning, resting, and soils and manures; such being the subjects in which practical men are most interested. The whole work has, indeed, assumed such a form as to make it evident that the great object of the author has been, not to produce a work suited to men of science, but one which every well informed gardener may understand and apply. As the volume concludes with a very copious index of matter, there is no difficulty in ascertaining where any given subject is treated of."—*Gardeners' Chronicle.*

By the same Author,

INTRODUCTION TO BOTANY. 4th Edition, greatly enlarged; with 6 Plates, and numerous Wood Engravings. Two vols. 8vo, 24s.

*** It has been the Author's wish to bring every subject that he has introduced down, as nearly as possible, to the state in which it is found at the present day. In doing so, he has added so very considerable a quantity of new matter, especially in what relates to Vegetable Anatomy and Physiology, that the present Edition may be considered, in these respects, a new work.

London: LONGMAN, BROWN, GREEN, & LONGMANS.

Price 3s. 6d., free by post,

THE TREE ROSE.—Practical Instructions for its Formation and Culture. Illustrated by 24 Woodcuts. Reprinted from the GARDENERS' CHRONICLE, with additions. J. MATTHEWS, 5, Upper Wellington Street, Covent Garden.

ILLUSTRATED GARDENING PERIODICAL.—Hardy Ferns are illustrated and practically described in the "COTTAGE GARDENER." Published Weekly, price Threepence. A Specimen Number free by post for four Postage stamps. Office: 20, Paternoster Row, London.

TO NURSERYMEN AND GARDENERS.

REIGATE SILVER SAND, 12s. per ton, 1s. 6d. per bushel, or 16s. per ton, delivered to any of the London Wharfs or Railways, or within a circuit of five miles. Peat and Loam of various qualities. Sacks 2s. each.

KENNARD BROTHERS, Swan Place, Old Kent Road.

HOW TO KILL RATS, MICE, AND MOLES BY HUNDREDS.—A Method will be forwarded with instructions for 30 postage stamps, which will destroy the above vermin quickly and without trouble. 1000 acres may be cleared for a few shillings.

GILBERT DYSON, Hoo, Rochester.

HOW TO KILL RATS AND MICE BY HUNDREDS.—A Receipt may be had, honestly worth 50, without trouble, by sending 30 postage stamps and a directed envelope to Mr. WILLIAM FRANKLIN, Post-office Street, Norwich, who will forward it with plain instructions, &c. This is a most extraordinary remedy, such as no Farmer, Merchant, or Miller ought to be without, as it will save them pounds yearly by killing every Rat or Mouse either in the field, stack, or house.

TANNED NETTING, for the protection of Fruit Trees from frost, blight, and birds, and for the security of fresh sown seeds, either in Gardens or Fields, at 1d. per square yard; 200 yards, 14s.; 500 yards, 30s.; 1000 yards, 50s. Scrim Canvas, for Wall Fruit.—At EDGINGTON and Co.'s, Rick Cloth, Tent, and Waterproof Cloth Manufacturers, 17, Smithfield Bars, City, and Old Kent Road, Southwark; Emigrant Outfitters, Ship Chandlers, and Export Merchants, Brunswick Street, near the East India Export Dock, Blackwall.

FRUIT TREES, POULTRY, RABBIT, AND SHEEP FENCING.—New Twine Netting (tanned if required), 1 yard wide, 2d. per yard; 2 yards wide, 4d. per yard; 4 yards wide, 8d.; half-inch Mesh do., 2 yards wide, 5d. per yard. Tanned Netting, 2 or 3 yards wide, 1½d. per yard; 4 or 6 yards wide, 3d. per yard. Elastic Hexagon Garden Net, or Scrim Canvas, 4½d. per square yard. Cocoa-nut Fibre, or Hemp Sheepfolding Net, of superior quality, 4 feet high, 4d. to 6d. per yard. Rabbit Net, 4 feet wide, 2d., 6 feet wide, 3d., 8 feet, 4d. per yard. Each edge corded, ½d. per yard extra, suitable for Poultry Fencing. Square Mesh Cricketing Net, fix its full width and length, made of stout cord, 3d. to 4d. per square yard; this is the best article for Fencing against Fowls, Cats, &c.—W. CULLINGFORD'S, 1, Edmund Terrace, Ball's Pond, Kingsland, London.

A 20-yard Drag Net, with purse complete, 2l. 10s.; a Single Walled Drag Net, any length and depth, 1s. per square yard. Casting Nets, complete, 1s. 6d. per yard, measured round the leaded line; Flue Nets, any size, 1s. per square yard complete. Minnow Nets, Eel Nets, and Landing Nets equally cheap, all warranted first-rate quality and workmanship. New Netting Tanning, add 1s. per 100 yards to the above prices. The Netting others advertise as Tanned Net is the repaired Fishing Net, which they charge 3d. per yard for—more than it costs when new, and after it has been in wear four years.

TRELOAR'S COCOA-NUT FIBRE MANUFACTURES, consisting of MATTING, MATS, MATTRESSES, BRUSHES, NETTING, HORSE-HAIR, and BRISTLE SUBSTITUTE, are distinguished for superiority and excellency of workmanship, combined with moderate prices. Prize Medal both in England and America at the Exhibition of all Nations.

T. TRELOAR, Cocoa-nut Fibre Manufacturer, 42, Ludgate Hill, London.

WATERPROOF PATHS.
BARN AND CATTLE SHED FLOORS.

THOSE who would enjoy their Gardens during the winter months should construct their walks of PORTLAND CEMENT CONCRETE, which are formed thus:—Screen the gravel of which the path is at present made from the loam which is mixed with it, and to every part of clean gravel add one of sharp river sand. To five parts of such equal mixture add one of Portland Cement, and incorporate the whole well in the dry state before applying the water. It may then be laid on 2 inches thick. Any labourer can mix and spread it. No tool is required beyond the spade, and in 48 hours it becomes as hard as a rock. Vegetation cannot grow through or upon it, and it resists the action of the severest frost. It is necessary, as water does not soak through it, to give a fall from the middle of the path towards the sides.

The same preparation makes first-rate paving for BARNS, CATTLE-SHEDS, FARM-YARDS, and all other situations where a clean, hard bottom is a desideratum. May be laid in winter equally well as in summer.

Manufacturers of the Cement, J. B. WHITE & BROTHERS, Milbank Street, Westminster.

Printed by WILLIAM BRADBURY, of No. 13, Upper Woburn Place, in the Parish of St. Pancras, and FREDERICK MULLETT EVANS, of No. 27, Vincent Street, in the Parish of St. Margaret and St. John, Westminster, both in the County of Middlesex, Printers, at their Office in Lombard Street, in the Precinct of Whitefriars, in the City of London; and published by them at the Office, No. 5, Charles Street, in the Parish of St. Paul's, Covent Garden, in the said County, where all Advertisements and Communications are to be ADDRESSED TO THE EDITOR.—SATURDAY, July 7, 1855.

THE GARDENERS' CHRONICLE AND AGRICULTURAL GAZETTE.

A Stamped Newspaper of Rural Economy and General News.—The Horticultural Part Edited by Professor Lindley.

No. 28.—1855.] SATURDAY, JULY 14. {Price Fivepence. Stamped Edition, 6d.

WATFORD HORTICULTURAL AND FLORICULTURAL SOCIETY.—The first grand Show of the above Society will be held by permission of the Earl of Essex, in Cassiobury Park, near Watford, on WEDNESDAY, the 18th day of July; open to all Exhibitors. An efficient band will be in attendance. Schedules are now ready, and can be had on application to the Secretary, Mr. J. Taylor.

By order of the Committee, John Pearce Taylor.

THE NORTHERN COUNTIES CARNATION AND PICCOTEE SOCIETY'S EXHIBITION will, by the kind permission of the Council, be held in the New Exhibition House at the BOTANICAL GARDENS, MANCHESTER, on FRIDAY, the 17th August next, when Three Silver Cups, value five guineas each, and 50*l.* in money will be awarded for collections in stands and single specimens in classes of CARNATIONS, PICCOTEES, ROSES, HOLLYHOCKS, and PANSIES. For Schedules and particulars apply to Mr. J. S. Holland, Hon. Sec. to the Northern Counties Carnation and Piccotee Society, Bradshaw Gardens, Middleton, near Manchester; or to Mr. J. Shaw, Secretary to the Botanical and Horticultural Society, Manchester.

THE GARDENERS' ROYAL BENEVOLENT INSTITUTION.—John Kent returns his most grateful thanks to those kind friends who so liberally supported him at the last election, and humbly begs the continuance of their support at the Election in January next.

GARDENERS' BENEVOLENT INSTITUTION.—The Friends of GEORGE KIDD, a candidate for the Pension of the GARDENERS' BENEVOLENT INSTITUTION, beg to return their best thanks to those Subscribers who kindly assisted him with their votes and interest at the election which took place yesterday. Although not successful, their assistance has placed him in such a position on the Poll, that with renewed exertions at the next election his friends confidently expect he will succeed; they therefore must again request the aid of all those who have heretofore so kindly given their support. Mr. Thomas Jackson, Nurseryman, of Kingston, and Mr. Thomas Gaines, Nurseryman, of Battersea, who have known George Kidd many years as a most deserving man, will be happy to answer any inquiries, and, at the next election, to receive Proxies on his behalf.

Kingston-upon-Thames, July 5, 1855.

WILLIAM BARRATT, Landscape Gardener, Wakefield.

*** Plans and Estimates furnished.

JOHN HARRISON, Nurseryman, Seedsman, Florist, Landscape Gardener, &c.

Plans and Estimates furnished; Experienced Gardeners recommended; also several Young Men in the Nursery waiting for Under Gardeners' Situations.—Darlington, July 14.

GEORGE TAYLOR, Jun., Choice Fruit and Vegetable Salesman, St. John's Market, Liverpool.

Contractor and Purchaser of Choice Garden Produce. Salesman on Commission.

Terms, Cash.

Forward as above.

WHITE LISBON ONION SEED.—Large buyers can be supplied with White Lisbon Onion Seed in quantity.—Apply to Mr. Henry Clarke, Seed Merchant, 39, King Street, Covent Garden.

ROSES.

JAMES MITCHELL begs to announce that his unrivalled collection of ROSES is now in fine bloom.

Piltdown Nurseries, Maresfield, Sussex, July 14.

ROSES.

GEORGE CLARKE begs to announce that his fine collection is now in full bloom, and will continue so till autumn.—Streatham Place Nursery, Brixton Hill, near London.

WILLIAM WOOD AND SON'S COLLECTION OF ROSES is now coming into fine bloom, and will continue in perfection during the Rose season.

Woodlands Nursery, Maresfield, near Uckfield, Sussex.

ROSES.

A. PAUL AND SON invite inspection of the Collection of ROSES at the Cheshunt Nurseries, which is just coming into Bloom, and will continue to offer new objects of interest from the present time till the end of October. The best means of reaching the Nurseries is by Eastern Counties Rail to Cheshunt or Waltham Stations.

Cheshunt Nurseries (13 miles N.E. of London), July 14.

ROSES.

H. LANE AND SON, The Nurseries, Great Berkhampstead, have the pleasure to inform their patrons that their extensive Collection is now in bloom, and will remain so for some time. Their Coniferæ, Rhododendrons, and a general collection of Trees and Shrubs, also Fruit Trees (especially in pots, which can now be seen in full bearing) are remarkably healthy and well worthy the attention of planters. The Nurseries are within a few minutes' walk of the Railway Station on the London and North Western Railway, and an Omnibus from the station passes the gates.

IMPROVEMENT OF GRASS LANDS.

SUTTON'S RENOVATING GRASS SEEDS should be sown immediately after the hay is carried.

These Seeds consist of Perennial Clovers *and* fine Grasses *for improving the bottom.* Price 9*d.* per lb., or 80*s.* per cwt. Eight or 12 lbs. per acre will be sufficient, and will produce a great increase in the produce.—Sutton & Sons, Reading, Berks.

THE BEST SUBSTITUTES FOR SWEDES.

SUTTON'S PURPLE-TOP YELLOW HYBRID, SUTTON'S GREEN-TOP YELLOW HYBRID AND ORANGE JELLY TURNIP.—Prices, &c., will be forwarded, Post-free, on application (stating quantity required), by Sutton & Sons, Seed Growers, Reading.

THE QUICKEST TURNIP KNOWN.

SUTTON'S EARLY SIX-WEEKS TURNIP.—*Good New Seed* 1*s. per lb., or* 6*s. p. gallon,* 45*s. per bush.* Carriage free except small parcels.

SUTTON & SONS, Seed Growers, Reading.

TURNIP SEED OF PURE SELECTED STOCKS.

FOR

BASS AND BROWN'S Advertisement of present prices, see *Gardeners' Chronicle* of April 28th, and May 5th and 12th. Reduced prices for large quantities.

Errata.—For "Laing's Purple-top Swedes, 1*s.* per lb.," *read* "1*s.* 9*d.* per lb." the same price of the other three Swedes.

To the Trade.—Prices will be supplied on application.

Seed Establishment, Sudbury, Suffolk.

ENGLISH CROWN RAPE, OR COLE SEED.

CHARLES SHARPE AND CO. beg to acquaint the Trade that they can supply any quantity of the above; prices and samples forwarded on application.

Nursery and Seed Establishment, Sleaford, July 14.

CABBAGE SEED.

CATTELL'S DWARF BARNES, and CATTELL'S DWARF RELIANCE may be had by post for 12 penny stamps per packet, the former containing one ounce and the after half an ounce.—Nurseries, Westerham, Kent.

CABBAGE PLANTS.

THOMAS WELLAND is now selling fine Drumhead for Cattle at 3*s.* 3*d.* per 1000, or 7000 for 21*s.*; also a good variety of Garden Plants for the season; packed and sent free to the station.—Surrey Gardens, near Godalming, Surrey.

SHILLING'S QUEEN CABBAGE, true as originally sent out, will not run to seed before cabbaging. Sow the third week of this month for spring use. 1*s.* per oz., free per post.—Stephen Shilling, North Warnborough Nursery, near Odiham, Hants.—July 14.

VINES FROM EYES.—Fine Plants of BLACK HAMBURGH [illegible] leading sorts in Cultivation are now in a suffic[illegible] to pack. Sorts and price upon application.—Royal Nursery, Stratford-on-Avon. July 14.

GRAPE VINES FROM EYES.—This being a favourable season for planting Vines, and thereby saving a year, the undersigned has a large stock of all the leading kinds in strong plants, exposed to greenhouse temperature, which consequently enables them to be sent to any part of the country with perfect safety.—R. Glendinning, Chiswick Nursery, London.

AZALEAS.

H. LANE AND SON, the Nurseries, Great Berkhampstead, have a very fine large stock of Indian Azaleas, consisting of Optima, Exquisita Perryana, and other leading varieties, at from 12*s.*, 15*s.*, 18*s.*, 24*s.*, and upwards, per dozen. Also a fine stock of young specimens, Catalogues of which may be had on application.

AZALEAS AND ERICAS.

W. J. EPPS has much pleasure in offering the following fine, bushy, well-grown plants, and of the choicest and best varieties, in large 48 and 32-size pots.

AZALEAS 18*s.* per dozen; 5*l.* per 100.
ERICAS 12*s.* and 18*s.* per dozen; 4*l.* and 5*l.* per 100.

These will make very pretty specimens for the ensuing season; all orders to be accompanied with a remittance from unknown correspondents.—Maidstone, July 14.

CALCEOLARIA AND CINERARIA.

MESSRS. E. G. HENDERSON AND SON beg to announce that the above FLOWER SEEDS, saved from the choicest varieties, may be had in packets at 2*s.* 6*d.* and 5*s.* each; the finest quality of CALCEOLARIA is only offered at 5*s.*; second quality, 2*s.* 6*d.*

This Season's CATALOGUE will be forwarded on application, and a Beautiful Coloured Plate of nine new Flowers will be sent on receipt of 12 postage stamps.

Wellington Nursery, St. John's Wood, July 14.

CALCEOLARIA SEED.

R. PARKER has now ready for sending out Seed which he can recommend with the greatest confidence, it having been saved from flowers of the finest form and most beautiful markings, in packets at 1*s.* 6*d.* and 2*s.* 6*d.* each. Also choice CINERARIA seed saved from the finest named varieties, at 1*s.* 6*d.* and 2*s.* 6*d.* per packet. A remittance or reference to accompany all orders from unknown correspondents.

Paradise Nursery, Hornsey Road, London.

CALCEOLARIA AND CINERARIA SEEDS.

GEORGE CLARKE has again the pleasure of offering seed of his unrivalled collection of CALCEOLARIAS. From their well known merit, and many testimonials received in their favour, little need be said in their praise. Many of them can still be seen in bloom at the Nursery. Great care has been bestowed in the saving, so that none but first-rate flowers can be expected. Packets, price 2*s.* 6*d.* and 5*s* each.

Also CINERARIA, saved from none but the finest flowers and, like the Calceolaria, is warranted to give satisfaction Packets, price 2*s.* 6*d.*, payable in postage stamps or otherwise.

Streatham Place Nursery, Brixton Hill, near London.

67, High Street, Battle, Sussex.

EMPEROR NAPOLEON—A New Scarlet Geranium.

JOHN BUTCHER is now sending out the above splendid Geranium; a seedling raised by himself was exhibited June 13th at the Royal Botanic Gardens, Regent's Park, London. See *Gardeners' Chronicle* June 16. Good Plants for immediate Bedding, 18*s.* per doz.; extra size, 2*s.* 6*d.* London agents, Messrs. Dawe, Cottrell, & Benham.

Royal Nursery, Stratford-on-Avon.—July 14.

TO AMATEURS IN CONIFERÆ.

MR. BARRON, of Elvaston Castle, can supply a few strong PLANTS of PICEA NOBILIS, upwards of three years old, which have never been in pots, hence the roots are what they should be. The only seedling Plants (of this the most beautiful of all Firs) that have ever been raised since its first introduction to Europe. They will be sent out in the middle of September, the best plants to the earliest applicants. The largest size 63*s.*, and the next 42*s.* Notice will be given before the Plants are sent out, when a remittance will be required from unknown correspondents.

TO PINE GROWERS.

WANTED, from 20 to 30 strong Fruiting QUEEN PLANTS, quite clean. They must either be showing fruit now or be about to do so.—A note addressed to O. O., Post Office, Derby, stating price, &c., will be attended to.

NEW AND SPLENDID ACHIMENES, ETC.

HENRY WALTON, Florist, &c., Edge End, Marsden, near Burnley, Lancashire, is now prepared to send plants of the following out, post free, at the undernamed reduced prices:—

ACHIMENES (each).—Ambroise Verschaffelt, 5*s.*; Dr. Hopf, 5*s.*; Edward Boissier, 3*s.* 6*d.*; Edmond Otto, 2*s.* 6*d.*

Also the eight following fine varieties for 12*s.*, post free, or separate, at the prices annexed:—Achimenes Carl Walforth, 1*s.* 6*d.*; Cherita, 1*s.* 6*d.*; Louis Van Houtte, 1*s.*; Gigantea, 5*s.*; Madame Randatler, 3*s.*; Mr. Parparet, 1*s.*; Sir Traherne Thomas, 1*s.*; Hendersoni, 2*s.*; Clianthus magnifica, 2*s.* 6*d.* each; Begonia Prestoniensis, Superb, 2*s.* 6*d.*; strong plants, 5*s.*; Eugenia Ugni, 2*s.* 6*d.*

Also all the new VERBENAS of this season, including Lady Lacon, Wonderful, Blue Beard, Lord Raglan, Mrs. Woodroffe, &c., 1*s.* 6*d.* each, or 18*s.* per dozen, post free, for all of which see advertisement in *Chronicle* of June 23d, and previous numbers.

Post-office orders are respectfully solicited to accompany all orders (unless reference is given), payable at Marsden, Lancashire.

BEAUTIFUL NEW CONIFEROUS PLANT, "ARTHROTAXUS DONIANA."

W. MAULE AND SONS have much pleasure in announcing to the lovers of Coniferous and rare plants that after this week they intend sending out this beautiful tree from the Rocky Mountains, far south of Australia, which mountains are stated by their collector to be covered with snow, and inaccessible from ice nine months out of the twelve. This elegant evergreen tree has stood with little or no injury the two last winters, when at the same time Pinus insignis, Araucaria imbricata have been much injured, and many of our old evergreens quite killed close by their side. The stock of this rare plant is very limited. Established Plants, in 60 size pots, 42*s.* each.

Those gentlemen who have subscribed their orders, and may order this new plant, are respectfully informed that the strictest regularity will be observed in forwarding the strongest plants in rotation as their orders have been and are received.

Stapleton Road Nurseries, Bristol, July 14.

HOW TO KILL RATS, MICE, AND MOLES BY HUNDREDS.—A Method will be forwarded with instructions for 30 postage stamps, which will destroy the above vermin quickly and without trouble. 1000 acres may be cleared for a few shillings.

Gilbert Dyson, Hoo, Rochester.

HOW TO KILL RATS AND MICE BY HUNDREDS.—A Receipt may be had, honestly worth 20*l.*, without trouble, by sending 30 postage stamps and a directed envelope to Mr. William Franklin, Post office Street, Norwich, who will forward it with plain instructions, &c. This is a most extraordinary remedy, such as no Farmer, Merchant, or Miller ought to be without, as it will save them pounds yearly by killing every Rat or Mouse either in the field, stack, or house.

WARNER'S SWING WATER-BARROW
(TO HOLD THIRTY GALLONS)
